A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

THE WEEK.

THE London County Council on Tuesday considered the subject of the proposed lunatic asylum at Bexley. The asylums committee proposed to obtain plans and estimates by competition, and recommended that they should be enabled to incur a preliminary expenditure of 2,000*l*. An amendment was moved to the effect that the cost of the building must not exceed 350,000*l*., and that an architect should be engaged who was to be paid by salary, and also all necessary assistants, to prepare the plans and to supervise the construction of the asylum. As fifty-seven votes were given for the amendment, and only thirty-five against, it was approved; but subsequently another amendment was adopted reducing the amount to be expended to 300,000*l*. An amendment which recommended that the committee should be asked to consider the advisability of engaging an architect to prepare plans and superintend the works for a fee of 10,000*l*. was negatived. The arrangement is further evidence of the animus of the Council towards architects. They are aware that from the overcrowded condition of the profession there will be no difficulty in obtaining architects who will gladly become district surveyors under the new arrangements, and consequently it is believed that a great many will compete for the temporary office in connection with the Bexley Asylum. Whether there will be much saving by a departure from the ordinary system remains to be seen. The Council expect of course that the architect will concentrate all his thoughts on the asylum, but the advantage of doing so is not apparent. Is he to become a substitute for a clerk of the works? In that case he would be needlessly expensive. It is not gratifying to discover that so many public bodies have not sufficient confidence in architects to entrust their commissions to them, for the London County Council did not initiate the change; but still more serious is the effect which is produced on the minds of ordinary clients. There are, however, many architects who are prepared to adapt themselves to the new conditions, and for the sake of assured employment to put the old master of works theory into practice.

It has been decided to erect a synagogue in the Commercial Road, close to its junction with Whitechapel, in substitution for one formerly located in Fenchurch Street, and demolished in 1892, but it is to be of much larger dimensions. The new synagogue will seat at least 1,000 male worshippers, and 400 female worshippers, and in connection with it there will be organisations designed especially to meet the requirements of the working-class Jews in the East End, a suitable court-house for the Beth Din (the Jewish Ecclesiastical Court presided over by the Chief Rabbi), and a Beth Hamedrash (Jewish house of study and library), which will be removed from its present quarters adjacent to the Great Synagogue in Aldgate. The approximate cost of the site is estimated at about 35,000*l*.

THE first report of the City Church Preservation Society has been prepared. Although the society has not yet completed a half-year's existence, it possesses about 150 members, and among the members of council are the Lord

Mayor, the sheriffs, and two of the members for the City. The committee report that they had taken action in two cases, viz., St. Ethelburga's Church, Bishopsgate, and the Church of All Hallows, Thames Street. The whole parish of St. Ethelburga had been aroused, and it was now generally believed that the church would be saved. As regarded All Hallows, a church about to be pulled down, the society had obtained counsel's opinion to the effect that, the site of the church being a disused burial-ground, any erection on it would be illegal. If that were so, the great inducement for pulling down churches would disappear, and it was hoped that further attempts at destruction would cease.

It is difficult to imagine what character a London Board school will have assumed when, if ever, the suggestions for the improvement of them come to an end. Lately it was proposed to make the schools serve for drilling-grounds, and to strengthen the floors for that purpose. Now they are to be made a sort of public baths. A Government inspector, it appears, considers that it would be advantageous to promote personal cleanliness among the boys. He therefore has recommended that at St. Clement's Road school, Notting Hill, a separate bath should be provided underneath the new hall; that the floor of the new hall be so constructed as to allow the whole or a portion to be easily removed; that a space be excavated under the floor, which will, when filled with water, and a movable portion removed, form a good and sufficient bath. The Board's architect said that three baths with a hot and cold supply could be set up in the school at a cost of about 200*l*. The works committee consider the recommendation should be carried out. The only obstacle appears to be a doubt about the legality of the expenditure. When an improvement or a change takes place in one school it is sure to be imitated elsewhere, and the manufacturers of baths are therefore likely to have a busy season before them.

MR. T. DREW, R.H.A., the assessor in the competition for the Mater Infirmorum Hospital, Belfast, has placed the plans of the following competitors according to their merits in the following order:—(1) Mr. J. W. FENNELLS, Belfast; (2) Mr. W. J. W. FERGUSON, Belfast; (3) Mr. GODFREY W. FERGUSON, Belfast; Mr. ANDREW J. GORDON, London; (4) Mr. A. J. JACKSON, Belfast. The preliminary competition having proved conclusive as to the excellence of planning, which is the main essential of hospital competition, the assessor has intimated that a second competition could not change the order of merit.

THE Glasgow Corporation have been fortunate in acquiring *The Boar Hunt*, by RUBENS, at the sale of the Adrian Hope Collection for 1,660 guineas. It is one of those bargains which are occasionally obtainable, although many experts are present. The picture, which measures 4 feet 6 inches by 5 feet 6 inches, is described in Smith's "Catalogue Raisonné," part 2, page 276, and was formerly in the collection of the late King of Holland. The auctioneer mentioned that at one time 1,000,000 francs (40,000*l*.) had been offered and refused for the work.

AUGUSTUS WELBY PUGIN.

IN 1830 AUGUSTUS WELBY PUGIN appeared in Edinburgh as a shipwrecked sailor (he was then a youth of nineteen) and called on GILLESPIE GRAHAM for assistance. The Scottish architect not only "rigged him out," to use PUGIN's words, but advised him to give up the contests with waters, winds and rocks, and to exercise his energy on architecture. His first efforts to educate himself could hardly be considered as encouraging, for before the year was over PUGIN, although still a minor, was arrested for debts which arose out of his experiment to combine theory and practice, business and study, by setting up as a carver of architectural ornament in Hart Street, Covent Garden. In the same year he married. Before he reached his majority he was a father and a widower. An ordinary man and especially one who was over-nervous would have succumbed under such a succession of adversities. But they were not all which weighed on him. If he could not make carving profitable, he thought it was at least possible to demonstrate that he was competent to build a house for himself. His "St. Marie's Grange," near Salisbury, was supposed to exemplify fifteenth-century arrangements, and there is no doubt it was singular in its exterior and uncomfortable within. After a very short occupation of it the model house was sold at less than one-fourth of the sum which PUGIN expended on the works. It might be supposed, therefore, that from such a succession of failures being associated with his name, PUGIN could not expect to gain confidence as an architect, yet in the course of a very few years he was one of the busiest architects in England, and certainly was more talked about than any of his contemporaries.

No less remarkable was the circumstance that he was able to secure commissions where the shrewdest man of business would say they were not to be found. When, soon after his minority came to an end, PUGIN abandoned the Church of England and joined the Roman Catholics, there was hardly one of their churches in all England in which he could pray with his eyes open. The buildings were such as could be erected by the pence collected from Irish labourers; and they were tawdry in their adornments, partly from poverty and partly from the belief that the majority of the worshippers were made happy by colours and forms that we presume would hardly be tolerated in a pre-historic period. Under persecution both clergy and people had so far degenerated as to forget that for centuries their Church was the inspirer, if not the creator, of productions in all the arts that were most noble. The rock that yielded at the touch of the leader's rod was not a more remarkable example of what can be accomplished by the mysterious influence that is in some men, than Roman Catholicism in England under the sway of AUGUSTUS PUGIN. Extraordinary sacrifices were gone through to realise visions which he set forth as if he were living in Mediæval times, when it might well be said, "Money was no object" to the projectors of the churches. The coldest men could not resist the glamour which he cast over their intellects. The Maynooth professors, all of them being rigorous logicians, when he prepared a plan of a college which was more uncomfortable than a prison, were blind to the defects of "the beautiful plan," and declared "there is no other person likely to be appointed who is in any degree equally qualified with Mr. PUGIN for executing buildings of

this kind"—a conclusion which they were destined to expiate by sufferings in their own studies and in their classrooms. The students of another ecclesiastical college—St. Edmund's, near Ware—were if possible more enthusiastic about PUGIN's "career of utility and fame," and expressed the hope that in the course of time they also would have commissions to entrust to him for new churches.

Of a different sort was the spell which PUGIN exercised over many of the more important representatives of the Church of England. They feared him. He might have been a magician who was likely by his fascinations to bring many innocent beings to destruction. The *British Critic*, which was the most able of all the Church quarterlies, in describing some of "Mr. PUGIN's magnificent interiors" wrote:—"It would be revenging ourselves, to our own most serious cost, if we refused to appreciate and profit by the splendid ideas which Mr. PUGIN's wealthy and zealous employers enable him to realise. We cannot, indeed, for a moment forget the misfortune that the direct results of this gentleman's labours and talents are lost to the English Church, nor can we think without grief of the many fair piles rising up around us, the shrines of a hostile communion. We scarcely know whether we can push our charity as far as the learned editor of the 'Memoirs of Oxford,' and 'rejoice to see such signs of good taste spreading among all classes of society of whatever religious denomination.' Still we think it both fair and wise to get all the benefit we can from every party."

Now the whole of the preceding passage is based on a delusion. It appeared in 1841, and expresses the belief that PUGIN, who was then no more than thirty, had accomplished most wonderful feats. If judged by the circumstances of the time they were wonderful, for in very few cases did he find "wealthy and zealous employers." PUGIN, who was a better judge of the difficulties which hampered him, could easily have proved to the apprehensive theologians that, however strong might be his desire to convert the majority of his countrymen to his new faith, yet, as PLUTUS was opposed to him, he could do but little. He wrote at a time when he

was supposed to be most successful:—"I have passed my life in thinking of fine things, studying fine things, designing fine things and realising very poor ones. I have never had the chance of producing a single fine ecclesiastical building, except my own church, where I am both paymaster and architect; but everything else, either from want of adequate funds, from injudicious interference and control, or some other contingency, is more or less a failure." The control to which he objected had also a financial origin, for when his fine pictures were not able to persuade men and women to become liberal, the clergy were justified in restricting the masonry until it bore some correspondence with the funds. PUGIN was therefore during a great part of his life a source of terror to friends and foes. The Protestant clergy believed "the preterpluperfect Goth" was undoing the moral effect of their sermons and of the Reformation, while the Catholics were afraid he was about to add to their misfortunes by making them all bankrupts. The timorous among the latter must also have had their misgivings about PUGIN's orthodoxy, for what was to be thought of a man who was depressed and miserable in Rome, and who could write in this style of things which have moved so many to

From a Painting by J. R. Herbert, R.A.

reverence?—"Were it not for the old basilicas and the associations connected with the early Christian antiquities, it would be unbearable—the Sistine Chapel is a melancholy room; the *Last Judgment* is a painfully muscular delineation of a glorious subject; the Scala Regia a humbug; the Vatican a hideous mass, and St. Peter's is the greatest failure of all." CHARLES DICKENS could not be more flippant in describing Renaissance art than was PUGIN. In Rome there is a good deal of tolerance for all those who exercise the right to differ when the subjects are buildings and pictures. PUGIN was presented with a gold medal by the Pope, but in England the denouncer of the importations of foreign ecclesiastical factories as "abominations" could never expect to gain the entire confidence of the higher or inferior clergy of his Church. PUGIN might be compared to one of those igneous or volcanic masses which disturb whatever comes in contact with them.

That he was endowed with extraordinary ability or force is certain, and it assumed a form which in his time was novel, and was therefore taken to be irresistible. Accident favoured him in an unusual way. As he bore a similar name, he inherited some of the reputation gained by his father in representing Gothic buildings and in making the illustrations acceptable to the public. In those days few cared to discriminate between the works of the elder PUGIN and the younger. The "Specimens of Gothic Architecture," "Architectural Antiquities of Normandy" and "Gothic Ornaments" appeared to be part of the same series as the "Gothic Furniture," the "Ironwork" and "Contrasts; or, a Parallel between the Noble Edifices of the Fourteenth and Fifteenth Centuries and similar Buildings of the Present Day," for between them come the "Examples of Gothic Architecture," on which father and son co-operated. Strangers were surprised when they saw AUGUSTUS WELBY PUGIN for the first time; his name was so long familiar they could not understand how he had resisted the operations of time.

His father's devotion to architecture as a means of gaining a living in a strange land would naturally create some interest for buildings in his son's mind, but as his father and mother both claimed to belong to feudal families, Mediæval remains appealed to his pride and imagination. The elder PUGIN was the most efficient "ghost" of his time, and it seemed likely that his son was marked out for that most useful office, which indeed he always exercised. But the cleverness of the lad in copying German prints at the British Museum surprised a goldsmith belonging to the firm of RUNDELL & BRIDGE, and PUGIN was invited to supply designs. In that way he was initiated into the mysteries of metalwork. Soon afterwards chance made a furniture designer of him. GEORGE IV. wished to have Windsor Castle furnished in befitting style. The commission was given to MOREL, a French upholsterer, who invoked the aid of his countryman, the elder PUGIN. The designs were prepared by his son. At Windsor he also met one of the supers at Covent Theatre, by whom he was introduced to the scene-painters' loft, and there he could observe how art of another sort was practised. In a short time he was engaged to design the architectural scenes which were required for an operatic version of "Kenilworth."

Having exercised his versatility repeatedly, PUGIN might well imagine that his knowledge was to be applied in other ways, and therefore it would be wise to make a more exact study of Gothic detail. There were no collections of casts sixty years ago in the museums, to which he could turn for inspiration. He therefore went to the buildings and amassed knowledge with a rapidity that surprises a modern student. PUGIN was not, however, the kind of man who could fill sketch-books and portfolios with as much placidity as an entomologist or a botanist can fill his cases. He had suffered as well as aspired, but apparently it was only hate which could make him put forth all his power. He found an enemy in JAMES WYATT, who had been killed by the breaking down of his carriage twenty years before, and pursued the unlucky ghost like one of the scourge-armed furies. He related in one of his letters how he visited Hereford, where he was disappointed by that commonplace city. "Maddened by the sight," he says, "I rushed to the cathedral; but horror! dismay! the villain WYATT had been there—the west front was his. Need I say more?

No. All that is vile, cunning and rascally is included in the term WYATT." Afterwards he wrote from Ely in the same strain:—"This monster of architectural depravity, this pest of cathedral architecture, has been here; need I say more? I wound myself up to the pitch to bear the sight of the havoc he had committed. The man, I am sorry to say, who executes the repairs of the building was a pupil of the wretch himself, and has imbibed all the vicious propensities of his accursed tutor."

WYATT'S operations imparted a new interest to the cathedrals and churches. They became to PUGIN beautiful beings that had been maimed for ever by the bungling hands of an unskilful surgeon. Henceforth they appealed to his pity as well as to his admiration. Next he became persuaded that the clergy who employed WYATT were still more blameable. "I feel perfectly convinced," he wrote to the same friend, "the Roman Catholic Church is the only one in which the grand and sublime style of architecture can ever be restored." With PUGIN ideas were the preludes of prompt action. Having once concluded that his mother's creed was not favourable towards art, he quickly abandoned it. The change will appear less remarkable if it is borne in mind that PUGIN was mastered by a Frenchman's love of system. While he could admire the Mediæval churches in England, they appeared to him to be unskilfully planned. But as soon as he applied himself to liturgical knowledge, then he found delight in tracing "the fitness of each portion of these glorious edifices to the rites for whose celebration they had been erected."

From its connection with religion architecture henceforth became to him not merely an art that was calculated to subserve utility, but one that was glorified. As a representative of it, PUGIN firmly believed that he was competent to explain doctrines, and there are large parts of his lectures in the Oscott College which might be supposed to have been delivered from the manuscript which some professor of theology had prepared for his own classes. It is needless to say Mediæval architecture alone was considered by him as qualifying a practitioner for so high an office. The Renaissance, which to his mind was only another name for Paganism, he regarded as a sort of dragon that was at all times and in all places seeking to devour. He saw his faith was endangered by every hour he spent among the buildings in Rome, and that the metropolis of Christendom should delight in such monstrosities of architecture was almost enough he said to make a man an infidel.

PUGIN is not to be understood unless we make allowance for the bias of his mind. The son of a royalist who fought against the first revolutionists, he would, if he had power, put the whole world under a hierarchical government. He once designed a wrapper for a penny popular magazine that was published in Derby, and he surrounded the page with medallions, in all of which clerics were dominant. Of course the magazine failed, but PUGIN'S principles were asserted.

One satisfactory result of his theory was a vindication of the connection between architecture and honest work. CARLYLE did not denounce the shams of society with more vigour than PUGIN displayed in dealing with those of building. And of the two the architect was the more successful. For as the *Times* wrote after PUGIN'S death, "Let us remember to his honour that if now there seems to be the dawn of a better architecture, if our edifices seem to be more correct in taste, more genuine in material, more honest in construction, and more sure to last, it was he who showed us that our architecture offended not only against the law of beauty, but also against the laws of morality." It should also be added that the honesty which PUGIN endeavoured to realise in architecture was also fostered by him in the numerous subsidiary arts to which he gave his aid as a designer or a producer. The book in which PUGIN is seen at his best is therefore his "True Principles of Gothic Architecture," in which, as his friend, Mr. FERREY, said, his aim "was to further the correct revival of ancient architecture by exposing the miserable way in which all branches of trade connected with Mediæval art were carried on, and the unsatisfactory result arising through the artifices and deceptions practised in the production of fabrics of every kind used in buildings of this description. Such true and incontrovertible principles are contained in this book that it may be safely affirmed we owe more to its influence in

correcting public taste than to all other causes combined. The simple and masterly manner, in which first principles are insisted upon constitute the key to the extensive usefulness of the volume, which is illustrated in the most happy manner by diagrams and sketches, all drawn and etched by himself."

PUGIN's book is as useful to-day as when it first appeared. On that account we have decided to reprint it in parts during the next few weeks, and students will be able to obtain what is a manual of the philosophy of architecture equally applicable to all styles at a fraction of the original cost.

"IS GOTHIC ARCHITECTURE A FAILURE?"—I.

[BY A CORRESPONDENT.]

NOT so many years since the asking of this question would have caused much surprise, and even more so at the commencement of the Gothic Revival, when the Cambridge Camden Society was a considerable force in leading public opinion in architectural matters. The answer would certainly in most cases have been, "Of course not!" though the older school of architects still refused to be seduced by the counter attractions of the resuscitated style. But "Thus does the whirligig of time bring about its revenge" to the more ancient phase of art, though scarcely in a manner that would be appreciated by the devout disciples of PALLADIO, who, could they see it, would be shocked by the great eclecticism in what is called Renaissance at the present day. The experiences of history will doubtless be repeated, and styles of architecture, like nations, will ever have their rise and fall if this world continues in its present form, and we are not nearing its last days, as is the opinion of not a few deep thinkers.

The subject which it is the earnest desire of the writer to consider, as far as possible, in a judicial spirit, must obviously be somewhat narrowed in its application, or otherwise the sufficient answer to it would extend to most unreasonable limits in these columns. It is, therefore, intended to confine these remarks to the English development of Gothic work, in the main, as also principally to secular and domestic buildings. For the question as to the adaptability of the Mediæval spirit to ecclesiastical structures has its ready reply in the fact of the large majority of new churches being designed in that style, notwithstanding the attempt made by Mr. NORMAN SHAW, a few years since, at St. Michael and All Angels, Chiswick, to carry out something of a "free Classic" type. The basilican church of St. Barnabas, Oxford, was an experiment by Sir ARTHUR BLOMFIELD also, and has not been followed by him in other new churches, which are decidedly Gothic. The late EDWARD J. TARVER likewise advocated a new departure of somewhat the same kind at a church proposed to be built at Telford Park, Streatham, where Portland cement concrete and trabeated construction was to supersede to a great extent that of the arch, somewhat after the type of the early Christian basilican churches of Rome. Subsequently the late JOHN D. SEDDING, at the church of the Holy Redeemer, Clerkenwell, designed an essentially Renaissance building, destitute of a Gothic feature in it. Though Holy Trinity, Sloane Street, the work of the same gifted hand, is much more Mediæval than Renaissance in spirit, it has many features of the latter. However, as has been before remarked, the Gothic school still, on the whole, retains its sway on English ecclesiastical architecture, notwithstanding these ebullitions of Classic energy, though the bias in many cases is towards the later phases of Gothic.

Now it is by no means, as was said at the onset, the intention of the writer to flaunt his colours as a partisan in the same way as was done at the so-called "Battle of the Styles," about a quarter of a century or so since. Most men are wiser now, and consider their differences more quietly, whether it may be in theology, politics, or in artistic matters. It certainly, however, by no means follows but that these feelings, at heart, of the combatants may not be very deep and sincere. Still, it is pretty generally conceded, at the present time, that it is better not to come to loggerheads, but to be broad-minded (not open-minded) up to a certain limit. Were such another as AUGUSTUS WELBY PUGIN to arise nowadays as the apostle of one

particular style, and write such a book as the "Contrasts," it would be unlikely to be appreciated by the public. For the times have changed greatly since that stirring work was brought out in 1836. Some twenty years later, in 1857, GEORGE GILBERT SCOTT published his "Secular and Domestic Architecture," but he was, of course, less vehement than had been PUGIN in expressing advocacy of Gothic work, and, moreover, was not imbued so much with the "odium theologicum" of that gifted man. Rather later, GEORGE EDMUND STREET took up the cudgels lustily on behalf of Mediæval architecture, and fought her battle with somewhat greater fire than had SCOTT, strongly evincing his detestation of modern Classic as applied to churches, sometimes dubbing it with the name of "Pagan" architecture, a curious instance of the extent to which a man's logic gets amiss when he goes in for extreme opinions. Then, in 1873, Mr. GRAHAM JACKSON wrote a *brochure* on "Modern Gothic Architecture," taking a much more independent line, and advising its development in a way he points out. It may be well at this point to say that the present writer, in order to keep his mind the more free, has advisedly refrained from re-reading or quoting from the books just mentioned. Neither has he re-studied Mr. CHARLES EASTLAKE'S "History of the Gothic Revival." So if, perchance, in this article he should appear to have plagiarised from these books, he must plead "Not guilty" to the charge. For history shows that men at all times have unwittingly and occasionally been led into identical trains of thought, without any communication whatever the one with the other. It is impossible to always avoid such coincidences. Thus far with this very slight historical reminiscence of some great pleaders for Gothic *versus* Classic. The former style having virtually gained the victory in this country, as applied to ecclesiastical work, its consideration in connection with secular and domestic buildings has now to be taken in hand by the writer.

For colleges and for structures of the character of the "Woodard" Schools (as they are still generally called, notwithstanding the modest protest of their first great Warden), for National schools, parsonages, small country villas and cottages, the sway of Gothic still in the main continues. But as regards the street architecture of cities or large mansions in the country, or municipal and other public buildings, including the London Board schools, the style adopted is most certainly not Gothic. Still, it is very unlikely that such a truly native product should ever vanish from this land. Though in the latter portion of the sixteenth century Gothic architecture became poor and debased, it never died out, and CARTER'S great publications stimulated public interest in the style and paved the way towards its revival rather more than half a century since. The books by AUGUSTUS PUGIN (the father of WELBY PUGIN), containing the excellent and correctly-measured drawings of Mediæval buildings, in which he was so ably assisted by clever pupils, likewise tended to help on the movement.

It will be well to look into some of the leading characteristics of the Mediæval school, as exhibited in secular and domestic architecture, and then compare them with those of the prevalent style, in the hope that some fresh light may be thrown upon the subject. The battle ground is not where it used to be in the conflict alluded to at the commencement of this article. For the buildings erected at the present day in the severe Classic type are few and far between, as compared with those in that mixed style, to which it is rather difficult to apply a proper epithet, as no one seems quite agreed on the point. Free Classic, or Queen Anne, will not suffice, but Neo-Classic is perhaps nearer the mark, though, indeed, as regards some buildings now put up a far less polite description might be very truly applied. It ought never to be forgotten (but often is) that art in its true sense has a catholic mission, and no man has a right to dogmatise about his own pet style to the exclusion of all others, though quite entitled to uphold the one he has most studied, loved and usually employed as the preferable. In fact, such enthusiasm is good for him and his work, so it is to be regretted that there is often much lukewarmness in such matters.

The true spirit of architecture is shown by the exercise of some common sense in the composition and details of the buildings to which proper principles are applied. But

unfortunately, in ancient as well as in modern work, this has but too frequently been overlooked, as is the case in many recent Free Renaissance structures. When the words "common sense" are spoken of in relation to ornament, it must be with some necessary limitations. Otherwise a building of the most utilitarian character might too often rear up its head, wanting in proportion and destitute of any beauty whatever. To strive in the composition so that every detail should have some meaning is obviously impracticable, though it is well to bear this in mind as a general principle. But it is not impossible in Gothic and other styles to eschew senseless ornament, to encourage the practice of purity and refinement in detail, and likewise to avoid overloading with decorative work—a crying failing at the present day, as has been recently pointed out in a public manner. Such aims are not peculiar to Gothic architecture, but applicable to any of the recognised styles of the world, though they may not be to some of those queer admixtures of a bastard kind.

One of the admittedly strongest points of the Gothic style is its extreme flexibility, its ready adaptability to circumstances, its way of getting over difficulties that at the first blush it would seem to have been impossible to tackle. No doubt this is to a considerable extent attained by the prevailing type of Free Renaissance as now practised, but not so absolutely. In Mediæval days, as in the colleges at Oxford and numberless other places, the heads of the windows are cusped, or in those of the Tudor period have four-centred arches to each light. For modern use, and except in halls two-storey high, or in staircases, it is generally considered more expedient and convenient to have square heads. The ridiculous notion that this treatment was not "Gothic" has long since exploded; for if properly studied, with sufficiently recessed jamb mouldings or chamfered orders in brick, terra-cotta or freestone, and possibly with suitable labels, mullions and transoms of sufficient apparent, as well as real, strength, we arrive at that charming feature which up to the present time has never been surpassed—"the mullioned window." Indeed, the latter was retained intact when the great impulse of the Renaissance wave that had spread over Europe was instrumental in giving to us that beautiful and characteristically English Elizabethan style which survived the Jacobean dynasty, and did not really come to an end during the time of the GEORGES. The mullion and transome may be said to have ever been with us since their initiation, though to a much reduced extent, and all through the eighteenth century. The features are, in truth, as much favourites now as in past years. When the so-called "Queen Anne" style was first resuscitated, mullions and transomes were of necessity left out in the cold. But numerous little panes of glass, with wood bars between them, soon failed to satisfy the eye or to properly fill the aching voids of large window openings. Substantial stone or terra-cotta mullions give a scale to the building, and appear to bind it together in a manner which no other scheme of fenestration will accomplish; for an enormous superficial extent of glass space can be occupied without the eye easily detecting it, or if doing so, being offended thereby, as, for example, in the famous Hardwicke Hall, Derbyshire, with its extraordinary amount of mullioned and transomed windows, popularly said to be equal in number to the days of the year—at any rate, it would take a very long time to count them all.

(To be continued.)

ARCHÆOLOGY OF THE HORNCastle DISTRICT.

THE annual meeting and excursions of the Lincoln and Notts Architectural Society were recently held, having, a correspondent of the *Guardian* writes, Horncastle as their centre. The peninsula, or "horn," between the little rivers Bane and Waring, on which Horncastle stands, was chosen by the Romans for a military station—Bannovallum, or the fort on the Bane—strengthened by walls, huge shapeless fragments of which still remain towards the river. The English named it "Hyrrn-ceaster," now modified into Horncastle. A curious fact in the history of Horncastle is its connection with the bishopric of Carlisle. It is "a far cry" from Cumberland to Lincolnshire; but in 1230 Walter Mauclerk, the fourth bishop of Carlisle, bought the manor, and in the early part of the next

century, when the army of Robert Bruce was devastating the Borderland and the bishop's house of Rose Castle had been sacked and burnt, Horncastle supplied a refuge to Bishop Halton, and the Pope, on receipt of a lamentable letter from the bishop, backed by one from Edward II., appropriated the benefice of Horncastle to the see. This inconvenient alliance survived in a much modified form to our own days, the bishops of Carlisle being patrons of the vicarage until some five and twenty years ago. By a triple exchange Bishop Jackson obtained the advowson for the see of Lincoln, the bishops of Carlisle being compensated by the living of Burgh-on-the-Sands, the place of the death of Edward I., which had belonged to Queen's College, Oxford, since its foundation, the college receiving in exchange the Lincoln living of Harlaxton.

The church of Horncastle is a good specimen of a moderate-sized town church, with Early English work on the base of its low square tower and its chancel arcade, Decorated arcades to the nave and a Perpendicular clerestory. Its main interest lies in the memories of the period of the Commonwealth it contains. On the walls hang a number of rusty scythe-blades used as extemporised weapons by the countryfolk at Winceby fight, and in the chancel aisle is the monument of Sir Ingram Hopton, the Loyalist commander, who fell while endeavouring to make prisoner of "the arch-rebel," Cromwell.

On leaving Horncastle on Wednesday morning the Society first visited the little Early English church of Ashby Puerorum, which takes its name from its having been appropriated in early days for the maintenance of the singing-boys of Lincoln Cathedral. They then passed on over the swelling wold-hills to the little village of Somersby, the birthplace of the late Poet Laureate. The church stands picturesquely on a steep bank overhanging the village. Near the south door is an almost unique example of a churchyard cross of the fifteenth century, entirely unmutated. A tall, tapering shaft bears the sacred emblem, protected by a gabled tabernacle, with sculptures of the Passion on one side and of the Blessed Virgin Mary and infant Saviour on the other. The church is very small and of the simplest character. From the unsymmetrical position of the church it seems once to have had a south aisle, now removed. Time only allowed a passing glimpse of the old-fashioned but perfectly commonplace front of the poet's birthplace, the old rectory now occupied by the lay-lord of the manor. Somersby certainly was too much hurried over—a fault extending to the whole excursion. As usual, too much was attempted, and consequently several places of interest comprised in the scheme were left out altogether, including to the regret of many the picturesque little village of Bag Enderby, Dr. Tennyson's other living, rich in reminiscences of the laureate's boyhood.

Omitting several of the churches visited, which presented no remarkable features, that of South Ormesby demands notice. Samuel Wesley the elder, the father of John and Charles, held the rectory here before he was transferred to Epworth where his famous sons were born, and in our own day it was held by the universally beloved and revered Chancellor Massingberd. The church restored and partially rebuilt by Massingberd is a typical English village church, standing high and solitary in a richly-timbered park, with the hall of the Massingberds reposing in the valley below and the rustic cottages of the village clustered in a scoop of the wolds at its feet. The church is a pleasing one with a good Early English arcade and pinnacled western tower and double-gabled Decorated chancel, and contains two fine brasses of the Skipwiths.

After lunch at the now disused hall at Harrington, and an inspection of the instructive series of Coppledyke monuments in the rebuilt church, reaching from the thirteenth to the seventeenth century, the members passed on to Old Bolingbroke. Of the famous historical castle, the residence of John of Gaunt and the birthplace of his son, Henry IV., held by the Royalists at the time of the battle of Winceby, 1643, and besieged by the Earl of Manchester, nothing remains save sundry mounds and earthworks and a piece or two of broken walling. The chief object of interest is the church. This, only the south aisle of the original church, is a beautiful example of flowing Decorated of the purest sort. The tracery of the windows cannot be surpassed for elegance. It has been recently restored in really admirable fashion by the late Mr. Fowler, of Louth, at the cost of a Lincoln corn merchant. A blocked northern arcade has been opened, a new north aisle built on part of the site of the original nave, the gables rebuilt and the roofs raised, a ritual chancel formed on the eastern bay, and the whole church well fitted and furnished.

Halting at Moorby to examine the curiously sculptured Decorated font in a modern church, the members reached Scirelby, in the wooded domain of the Dymokes, the hereditary champions of England. The church, though robbed of much of its interest by cruel restorations, still possesses the Early English arcades of its single north aisle, its richly carved chancel screen, and, most noticeable of all, the Marmion and Dymoke monuments, of which

the incumbent, Canon Lodge, gave a clear and instructive description. With Scrivelsby ended the first day's excursion. Of that of the second day, among the most interesting places visited was East Kirkby, an entirely unrestored church of Decorated date, full of interesting features, especially a curiously-sculptured Easter sepulchre, embellished with kneeling figures of the three Marys holding their caskets of spices. The whole church is in the most miserable state of squalor and neglect and threatened ruin. At Revesby there is a beautiful new church, the work of Mr. Hodgson Fowler, which owes its erection to Mr. Banks Stanhope and his noble-hearted kinsman, whose premature death not Lincolnshire alone, but the whole nation and its Church have to deplore. From Revesby the members passed on to Coningsby, a fine spacious church much injured by the mutilation of its clerestory, where a row of lancets have been converted into triangles with curved sides and an ill-designed modern apsidal chancel. The tall, plain, disengaged tower, of excellent stonework and dignified outline, stands on open arches, like that at Brading, in the Isle of Wight, and St. Mary's, Warwick. Within a short distance of Coningsby stand Tattershall Castle and Church, with which the excursion practically ended. Both of these buildings, equally remarkable as first-rate examples of the ecclesiastical and military architecture of the age, were the work of Ralph Lord Cromwell, Lord Treasurer to Henry VI., who died in 1455. The spacious cruciform church, once collegiate, with chancel and transepts of equal height with the clerestoried nave, is a typical specimen of Perpendicular at its best. After a long period of shameful neglect, when, robbed of its magnificent stained-glass, and the gaps unsupplied with any protection, the interior was left to the mercy of the elements, the chancel, which had become a roofless ruin, is now decently fitted up for worship, and the nave is slowly receiving substantial repairs. So noble a building, so utterly out of harmony with the wants of the scanty population, awakens a wish for Aladdin's lamp to transport it bodily to some large centre of population. Where it stands it is, and ever must be, comparatively useless, and a heavy burden on the incumbent and his parishioners. The magnificent series of brasses, the finest in the county, are all collected in the north transept.

Tattershall Castle consists of little more than the tall square keep-tower. It is a noble piece of red brickwork, now roofless, recalling the similar tower at the old palace of the bishops of Lincoln at Buckden. The fireplaces of the three chief stories, rich with heraldic bearings, are of vast size and magnificence. The corridors are exquisitely groined with brick-ribbed vaults. Each corner is strengthened with an octagonal turret, in one of which a winding stair gives access to the parapet walks on the summit, commanding splendid views towards Lincoln and Boston. This wonderful group of buildings, almost unrivalled in their date and style, formed a fitting termination to a too-much crowded but most agreeable two days' excursion.

TESSERÆ.

The Roof of Lambeth Library.

THE hall at Lambeth Palace was rebuilt at the cost of 10,500*l.* by Archbishop Juxon, 1660-63, in place of the former one built on the same site by Chichele, and demolished by Colonel Scott, one of the murderers of Charles I., to whose lot this palace fell in the division of the prey. Juxon ordered it to be built as much as possible like the old one, against the wishes and advice of others, who advocated a more modern style of building. On his death, after occupying the see only three years, he left directions for its completion according to his plan, provided his successor should consent. This is a very noble hall, 93 feet long by 38 feet wide and 50 high. The roof is undoubtedly a very grand one, but has great defects. The style is as mixed and corrupt as anything in that age. The open parts of the roof are all filled with Gothic tracery, while the great transverse arch is circular, and the ornament and pendant at the extremity of each hammer-beam is a complete Grecian entablature finished by a ball below, where the capital of the imaginary pillar would be. This is as great an anomaly as the entablature surmounting the external buttresses. The plan of the roof is evidently taken from that kind of roofs on the opposite side of the river, but it only adds to the defects of that structure. The collar is brought down considerably lower than in Westminster, thereby increasing the depth and apparent quantity of woodwork. Juxon was doubtless animated by a laudable desire to keep up the dignity of the see, and perhaps to prepare his palace for a revival of ancient manners, if the progress of human affairs should ever bring it about. Even in his time it was probably thought a hopeless attempt. The hall was rebuilt, but ancient hospitality is for ever fled. England will never again see the lord and his servants and retainers, down to his scullions and stableboys, and "eight or ten of the poor of the town by turn," all sitting down to one meal, sanctified by one blessing. Such a union of ranks is only to be

found in churches, and even there it bids fair to be soon obsolete. Some dread necessity, not to be wished for, or even thought of without horror, yet with its good as well as its evils, may some day drive rich and poor more into one another's society, and make them feel and pay their mutual debt. The hall has been a comparatively useless room ever since it was built, except for two months in 1780, when, in consequence of the disturbed state of the Metropolis, two or three hundred soldiers, with their wives and families, were quartered in the palace, dining in the great hall and attending divine service twice a day. It was converted into the archiepiscopal library under the directions of Mr. Blore.

Subject in Painting.

The imitation of nature, as it presents itself in space and figure, being the real sphere of plastic invention, it follows that whatever can occupy a place and be circumscribed by lines, characterised by form, substantiated by colour and light and shade, without provoking incredulity, shocking our conception by absurdity, averting our eye by loathsomeness or horror, is strictly within its province; but though all nature seem to teem with objects of imitation, the "choice" of subjects is a point of great importance to the artist; the conception, the progress, the finish and the success of his work depend upon it. An apt and advantageous subject rouses and elevates invention, invigorates, promotes and adds delight to labour; whilst a dull or repulsive one breeds obstacles at every step, dejects and wearies—the artist loses his labour, the spectator his expectation. The first demand on every work of art is that it constitute one whole, that it fully pronounce its own meaning, that it tell itself; it ought to be independent; the essential part of its subject ought to be comprehended and understood without collateral assistance, without borrowing its commentary from the historian or the poet; for as we are soon wearied with a poem whose fable and motives reach us only by the borrowed light of annexed notes, so we turn our eye discontented from a picture or a statue whose meaning depends on the charity of a cicerone or must be fetched from a book. As the condition that each work of art should fully and essentially tell its own tale undoubtedly narrows the quantity of admissible objects, singly taken, to remedy this, to enlarge the range of subjects invention has contrived by a *cyclus* or series to tell the most important moments of a long story—its beginning, its middle and its end; for though some of these may not in themselves admit of distinct discrimination, they may receive and impart light by connection. Of him who undertakes thus to personify a tale the first demand is that his invention dwells on the firm basis of the story, on its most important and significant moments or its principal actors. Next, as the nature of the art which is confined to the apparition of single moments forces him to leap many intermediate ones, he cannot be said to have invented with propriety if he neglect imperceptibly to fill the chasm occasioned by their omission; and, finally, that he shall not interrupt or lose the leading thread of his plan in quest of episodes, in the display of subordinate or adventitious beauties. On the observation of these rules depends the perspicuity of his work, the interest we take in it, and consequently all that can be gained by the adoption of an historic series.

Browne Willis.

Browne Willis, the first person who undertook a detailed and general Survey of the English Cathedrals, acquired his love for this pursuit by passing many of his idle hours in the Abbey when a Westminster boy. That Abbey was opened to the boys till they were deprived of a liberty which produced some injury to the monuments and some annoyance to the visitors and showmen. Browne Willis, who became one of the oddest of all odd men, had his share of peculiarities as a boy. The monuments were his books, and before he left school he imbibed there a love of churches and church antiquities which fixed the bent of his after life. He was a great repairer of churches and steeples, attended cathedrals and churches whenever he could so time his visits upon their dedication days; and when he went to Bath would lodge nowhere but in the abbey-house. A lively lady described him as having, with one of the honestest hearts in the world, one of the oddest heads that ever dropped from the moon. He wrote the worst hand of any man in England; it was more unintelligible than if he had learned to write by copying the inscriptions upon old tombstones. He wore three or four coats at once, each being of a different generation, and over them an old blue cloak lined with black fustian, all of which were girt with a leathern belt, giving him the appearance of a beggar, for which he was often taken in the course of his enthusiastic wanderings. His weather-beaten wig was of a colour for which language affords no name; his slouched hat, having passed the stage between black and brown, was in the same predicament as the wig; and the lower part of his equipments had obtained for him in his own neighbourhood the appellation of Old Wrinkle-boots, for during the wear and tear and repair of forty years, the said boots had contracted as many wrinkles as their quantum of calf-skin would contain, and consequently did no

reach half up the legs which they once covered. Being far too deeply engaged with past ages to bestow any portion of his thoughts and cares upon the present, he suffered a fair fortune to be deteriorated by neglecting his worldly affairs. And having lived long enough to hold a distinguished place among antiquities himself, he left behind him the character of a diligent and faithful antiquary, in which he will long continue to be remembered. Reputations of this class are not like those of fashionable authors, which come like shadows and so depart; they keep their place and make up in duration for what they want in extensiveness. Browne Willis did not complete his Survey of the Cathedrals. The work became the property of Osborne, the bookseller whom Johnson immortalised by knocking him down with a folio. Osborne advertised it as comprehending accounts of all, and the author considering this as an unwarrantable artifice, exposed the puff by a counter-advertisement.

Sculpture in Early Churches.

Sculpture was banished from the structures of the ancient Catholic Church; none displayed a greater modesty than those of Rome. The first Christian monuments upon which sculpture was employed are the ancient sarcophagi. In the catacombs the emblems of the dove, the fish, the anchor, the seven-branched candlestick of the temple, the palm-branch, the crown, rudely outlined upon the stone, indicate the resting-place of the veiled virgin, the priest, the confessor, or the martyr. When the sword of the prosecutor was sheathed, and the mourners might follow the relative to the cemetery without fear, the decent pride of sorrow was displayed upon the memorials, which frequently betray by their skill a hand trained in some school in which heathen traditions of art still prevailed. Christianity, however, controlled the pagan skill. The subjects, like those of the mosaics, were such as in themselves could never give a pretence for the sin of idolatry; a selection of types from the Old Testament, and of parables and miracles from the Gospel—Cain and Abel, Noah and the ark, the crossing of the Red Sea, Jonah and the whale, the marriage-feast of Cana, the multiplication of the loaves and fishes, and such like, constituted the only allowed ornament. Even these sepulchral monuments were never seen within the walls of the building, which, according to the emphatic words of the fathers and councils, was not to be defiled by death and corruption. It should seem as if the Western Church still entertained some lingering reluctance to incur the peril of transgressing the commandment "Non facies tibi sculptile," a commandment which may be violated but cannot be explained away. With the one exception of the statue of St. Peter and some decorations upon shrines, we do not believe that a single example can be adduced of a graven image within the walls of the earlier churches. Even the crucifix was only introduced by very slow degrees; it seems, generally speaking, that a feeling of reverence induced the early Christians to shrink, as it were, from representing the awful scenes of the Passion of our Lord.

Progress in Furniture.

In no point has there been so signal an improvement in modern times as in ordinary domestic furniture. The artisan now enjoys luxuries of this kind which were but three centuries ago beyond the reach of the crowned head. Even in the time of Elizabeth the comfort of a carpet was seldom felt, and the luxury of a fork wholly unknown. Rushes commonly supplied the place of the former, and the fingers were the invariable substitutes for the latter. Harrison, writing in the time of Elizabeth, thus describes the furniture in use immediately before his time:—"Our fathers (yea, we ourselves also) have lien full oft vpon straw pallets, or rough mats, covered onlie with a sheete, vnder coverlets made of dogswain or hopharlots (I use their own terms), and a good round log under their heads instead of a bolster or pillow. If it were so that our fathers, or the good man of the house, had, within seven yeares after his marriage, purchased a mattresse or flockebed, and thereto a sacke of chaff to rest his head vpon, he thought himself to be as well lodged as the lord of the towne, that, peradventure, lay seldom in a bed of down or whole feathers. As for servants, if they had any sheet above them it was well; for seldom had they any under their bodies to keep them from the pricking straws that ran oft through the canvas of the pallet, and rased their hardened hides." The lateness of the period at which the duxurious improvements in furniture were introduced is shown in Sir John Harrington's amusing reproaches of the "error rather than austerity" of those sticklers for old customs who looked upon cushions and carpets as heretical innovations. He asks:—"Doth it not as well become the state of the chamber to have easye quilted and lyned forms and stools for the lords and ladyes to sit on, as great plank forms, that two yeomen can scant remove out of their places; and waynscot stooles so hard, that since great breeches were layd aside, men can scant indewr to sitt on?" But though the balance in point of comfort is infinitely in favour of modern upholstery, on the other hand the splendour of our hangings, bed furniture and plate

is far inferior to that of the earlier periods. Carved and inlaid bedsteads, with hangings of cloth of gold, paled with white damask and black velvet, and embroidered with heraldic badges; blue velvet powdered with silver lions; black satin, with gold roses and escutcheons of arms; tapestry of cloths of gold and silver for hanging on the walls; gold plate enamelled with precious stones, and cloths of gold for covering tables—these are pomps and vanities occurring in every page of the elder time, and no doubt their effect must have exceeded in magnificence anything we see or hear of in the present day. These gorgeous "moveables" descended from generation to generation, and every ancient will is filled with bequests and inventories of them. Indeed, in the times that preceded the invention of those ingenious improvements upon the financial arrangements of our ancestors—Consols and Reduced Three per Cents.—and when the lending out money for hire was considered a disgraceful transaction, and almost confined to the Jews, such rich chattels, including plate and jewels, were employed as the most convenient, if not the only, investments of spare funds, being convertible into cash upon pledge or by sale at will.

Emblematic Painting.

Among the paltry subterfuges contrived by dulness to palliate the want of invention the laborious pedantry of emblems ranks foremost, by which arbitrary and conventional signs have been substituted for character and expression. If the assertion of Samuel Johnson that the plastic arts "can illustrate, but cannot inform," be false as a general maxim, it gains an air of truth with regard to this hieroglyphic mode of exchanging substance for signs, and the story which he adds in proof of a young girl mistaking the usual figure of Justice with a steel-yard for a cherry-woman becomes here appropriate. The child had seen many stall and market-women, and always with a steelyard or a pair of scales, but never a figure of Justice; and it might as well be pretended that one not initiated in the Egyptian mysteries should discover in the scarabæus of an obelisk the summer solstice, as that a child, a girl or a man not acquainted with Cesare Ripa, or some other emblem-coiner, should find in a female holding a balance over her eyes, in another with a bridge in her hand, in a third leaning on a broken pillar, and in a fourth loaded with children, the symbols of Justice, Temperance, Fortitude and Charity. If these signs be at all admissible, they ought at least to receive as much light from the form, the character and expression of the figures they accompany as they reflect on them, else they become burlesque instead of being attributes. Though this rage for emblem did not become epidemic before the lapse of the sixteenth century, when the cavalieri of the art, the Zuccheri, Vasari and Portas undertook to deliver more work than their brains could furnish with thought, yet even the philosophers of the art, in the classic days of Julio and Leo, cannot be said to have been entirely free from it. What analogy is there between an ostrich at the side of a female with a balance in her hand and the idea of Justice? Yet thus has Raphael represented her in the stanza of the Vatican. Nor has he been constant to the same emblem, as on the ceiling of another stanza he has introduced her with a scale and armed with a sword. The *Night* of Michel Angelo on the Medicean tombs might certainly be taken for what she professes to be without the assistance of the mask, the poppies and the owl at her feet, for the dominion of sleep is personified in her expression and posture; perhaps even her beautiful companion, whose faintly stretching attitude and half-opened eyes express the symptoms of approaching morn, might be conceived for its representative; but no stretch of fancy can in their male associates reach the symbols of full day and eve, or in the females of the monument of Julio II. the ideas of contemplative and active life.

Moisture and Masonry.

Water is the most destructive agent to construction. There is no quantity so small which, if repeated, is not ultimately fatal. The softest as well as the hardest material must yield to its insidious attack. No adage more true than "Gutta cavat lapidem." Our forefathers knew the connection between moisture and decay in soft material. Hence in the buildings of the districts where the soft stones prevail, the bottom courses of the walls will frequently be found to be formed of a hard and impervious stone, the strata of which are called by the quarrymen foundation-stone. Walls always above or always below water may, under certain circumstances, be laid without mortar. When between wind and water they never should.

Quoins.

Quoins of buildings and walls should always be carefully protected in the foundations, and well bonded in the superstructure. At the angles unequal settlement most frequently shows its effects, but when quoins are well supported they will keep up a weak wall. The Gothic architects were well aware of this; hence the immensely projecting buttresses at the angles of their lofty towers.

NOTES AND COMMENTS.

A PORTRAIT of Mr. L. HARVEY, after a painting by Mdlle. RAPIN, which was exhibited in this year's Salon, has appeared in *La Construction Moderne*. Instead of accompanying it with a biography, the occasion has been utilised by Mr. HARVEY to make an appeal to the French architects for a cause which he has at heart, and for which he has undergone many sacrifices, viz. the study of masonry in its noblest expansions. What he says does not apply to France alone, but to all countries where men are not satisfied to employ stone in forms that are better adapted for timber construction. Let it be once admitted that arching and vaulting are preferable to the lintel, although the latter may have received consecration by Greek hands, and it must follow that an almost infinite variety of curved surfaces can be introduced in architecture if competent designers and workmen are forthcoming. Mr. HARVEY points out that it is only in modern times that the association between architects and designs on paper became intimate. In earlier times architects, as it were, thought out their designs as solids, for they grew up among buildings, and could realise the effect of the smallest detail with a sort of prophetic vision. In our busier but less happy and less simple age, the substitute for the old training must be found in a mastery of stereotomy, that will be exhibited by operations in clay, stone and wood. As an old student of the *Ecole des Beaux-Arts*, Mr. HARVEY recommends that practical courses should be introduced in which building materials should be employed. Moreover, he suggests that all candidates for a diploma should have at least two years' experience as workmen, and in order that opportunities should be available he proposes that all contractors for public buildings should guarantee employment as apprentices to a certain number of students. Mr. HARVEY points out that a similar system of training is in operation in England for engineers who are ambitious to serve on the public works of India. Both in France and England there is a necessity for a change, as he perceives a tendency to be suspicious of the practical skill of architects, and consequently people apply to contractors for designs as well as for tenders.

IN France it would be feasible to carry out Mr. HARVEY's proposals, although at first Academicism might object to meddling with vulgar materials. Among us the obstacles are of another sort. There is no national school corresponding with the *Ecole des Beaux-Arts*, and in the substitutes, for it lines on paper, are supposed to confer efficiency in building on all who employ them. For several years Mr. HARVEY has been organising a system of instruction, in which practical masonry in its amplest developments formed the groundwork, and the skill attained by the students has been evidence that the effort was worthy of the support of all who are anxious to see architectural construction become something more than a veiling of steel and iron girders, which in many cases are employed to evade difficulties which could be overcome by a more congruous style. If Mr. HARVEY could have remained in London, there is little doubt that his classes at the Guilds Institute and his College of Masonry would have become institutions of a permanent character. But as he has been called back to Geneva, there is, of course, a risk that when deprived of his enthusiastic spirit they may not thrive. We have little doubt that some of the senior students would endeavour to carry on Mr. HARVEY's work, but support of other kinds are needed which can be given by a public body. The County Council, the Corporation, the City Guilds, the various architects' and builders' societies, and the governors of the new polytechnic institutes, have therefore an opportunity to render a service not only to architects and builders, but to the public, by fostering the classes until they become self-supporting. Let us hope that, singly or combined, they will be equal to the occasion.

THE decision given on Monday in *OAKLEY v. LENEY*, which was tried before Mr. Justice CAVE, is advantageous for people who will take houses in the country but will not accept the burthen of the lands adjoining. Two years ago the plaintiff became tenant of a house at Chilham, near

Canterbury. The defendant, who was the landlord, heaped a large quantity of manure near the house. It soon began to emit the odour which is dear to agriculturists. The plaintiff, however, did not enjoy it, and several months were allowed to elapse before the nuisance was removed. The plaintiff's wife was attacked by blood-poisoning, and was compelled to remain in Margate under medical treatment for a long time. Damages amounting to 500*l.* were claimed. There was the usual conflict of testimony by the experts at the trial. The local doctors who attended the patient considered the blood-poisoning was probably caused by the smell of the manure. Dr. FIFE, of London, considered that 88 yards was not a sufficient distance to render a manure heap innocuous, for in one of the official reports cases were mentioned where the source of danger was 300 yards distant. Dr. BOND, on the contrary, considered it was most improbable that the manure caused the illness, for before the septic germs could have travelled over 88 yards they would be oxidised by the air and rendered harmless. Mr. Justice CAVE took what might be called the common-sense view of the case. He said there was evidence to show that the smell was horrible. Consequently there was a nuisance. The question was, did it cause the illness? If the germ theory be true, blood-poisoning is caused by the introduction of septic germs into the system. These generally come by breathing foul air, as a rule sewer gas, or by drinking water or milk. In the present case the water need not be considered, and the drains did not reflect credit on the man who put them in, but they had been in the same state throughout, while the illness was only contemporary with the presence of the manure. An inference could be drawn from that stronger than any theories of doctors, that the manure caused the illness. As the judge was not satisfied with the form in which the plaintiff's accounts were rendered, he gave judgment for 150*l.* and costs. The case will form an important precedent, but agriculturists are likely to consider it as another mode of interference with their interests. It should, however, be remembered that the defendant had assumed responsibilities by letting his house, and his tenant should not be sacrificed for the sake of the farm.

M. JOSEPH CARRIÈS, the sculptor, has died in Paris in his thirty-eighth year. He was one of the few artists whose names appear in the official lists without any announcement of their teachers. M. CARRIÈS, who was a native of Lyons, was in fact a self-taught sculptor and decorator, and therefore occupied an exceptional position. His busts, however, were much admired, and he gained one of the medals of the Salon in 1881. It was anticipated that he would introduce a new application of pottery to decoration. He received a commission from an American lady for the decorations of a hall, which occupied him during several years, but as the work was not completed at the time of his death, it is uncertain whether art will be much enriched by his experiments.

AMERICANS and other visitors to Westminster Abbey must be amazed when they find that Sir WALTER SCOTT has not a memorial in Poets' Corner or elsewhere. There is, however, a medallion of the Last Minstrel, but it is in the clerk of works' office, which strangers are not likely to seek out. Seven years ago subscriptions amounting to 171*l.* were received by a memorial committee, and they paid 157*l.* to the late Sir JOHN STEELL for a medallion which was, it is said, made to the dimensions indicated by Mr. PEARSON, R.A. But when the medallion arrived the architect considered it was out of scale and not suitable to the Abbey. With that opinion the Dean and Chapter agreed, and it was confirmed by some non-official advisers who were consulted on the matter. Sir JOHN STEELL when he heard of the decision was of course disappointed, but he could only hope that the authorities would subsequently take a more favourable view of his work. That time has not arrived, and meanwhile SCOTT's name does not appear in a place for which it is worthy, and the most popular author of the century might therefore be supposed to have been another BYRON.

SOCIETY OF ARCHITECTS.

THE following report of the Council of the Society of Architects on the question of examination for membership appears in the current number of the *Journal* of the Society:—

On June 26, 1894, the Council adopted the following report of the committee on the examination of members:—

The subject of the desirability or otherwise of an examination of candidates for membership was referred to the Council at the annual general meeting held in October 1893, and since then it has been under careful consideration. A committee was appointed, and drew up a series of questions, which were approved by the Council and submitted to the members of the Society. The replies received have been considered, and the opinion of the members appearing to be practically unanimous, the Council have decided as follows:—

1. That after October 31, 1896, election to membership will only be open to candidates who have passed the Society's examination, with the following exceptions:—(a) Candidates who are not less than thirty-five years of age and have been directly engaged professionally in architectural pursuits as principals for at least seven years; (b) candidates who are not less than thirty-five years of age and have been directly engaged professionally in architectural pursuits as assistants for at least ten years.

Candidates applying for membership under (a) and (b) will be required as heretofore to submit drawings and other proofs of their professional abilities.

2. That the scheme of examination shall be formulated and published before June 30, 1895.

3. That a register of students between the ages of seventeen and twenty-three years be opened on November 1, 1894. Registered students shall be pupils or assistants in architects' offices and be nominated by a member of the Society, subject to the approval of the Council.

4. Registered students shall be entitled to the following privileges:—Free admission to lectures to be delivered under the direction of the Council in London and the Provinces, a ticket giving admission to the Society's ordinary meetings and the use of the Society's library for reference, and a copy of each issue of the *Journal*.

5. That each registered student shall be required to pay 5s. per annum on November 1 in each year, and shall cease to be a registered student on October 31 next, after his attaining the age of twenty-three years.

The above report will be laid before members at the annual general meeting in October next, of which due notice will be given.

DUNDEE INSTITUTE OF ARCHITECTURE.

THE annual meeting of the Dundee Institute of Architecture, Science and Art was held on Thursday, the 28th ult., Mr. William Mackison presiding. The secretary (Mr. J. J. Henderson), in submitting the annual report, stated that the Institute had now completed the tenth year of its existence. The membership at present was as follows:—Members, 54, being the same as last year; associates, 167, six less; and honorary members, 8, one less. According to the new scheme for the division of the country into districts promulgated by the Royal Institute of British Architects, Dundee had been made the centre for that part of Scotland north of the Forth, with the view to the fostering of architectural education in the district. A copy of the report of the conference held at Liverpool for considering the Royal Institute's scheme was sent to each member and to gentlemen interested in fine art education. Principal Peterson, in acknowledging receipt of a copy, wrote:—"There can be no doubt that Dundee needs to take a forward step in regard to the higher forms of art teaching. I have sometimes thought that the day would come when we should have in Dundee a professor of fine art, who would take under his wing such special and even more technical teaching as might be required. The difficulty is to get the right man; but if such a chair were founded, and the right man secured, I have no doubt he would make his influence felt, not merely by theoretical lecturing, but also by associating himself with every movement for the teaching or the appreciation of art in its various practical applications." It was also stated in the report that Edinburgh and Glasgow Institutes had sent copies of their sketch-books,

and it was suggested that a sketch-book should be started in connection with Dundee Institute. Mr. Robert Hunter, the treasurer, submitted the financial statement, from which it appeared that there was a balance of 16*l.* 19*s.* 11*d.* in hand. The reports were adopted. The following office-bearers and Council were elected:—President, Mr. Robert Keith; vice-president, Mr. Leslie Ower; members of council, Messrs. G. G. Maclaren, James Foggie, William Briggs, and William Nixon; secretaries, Messrs. J. J. Henderson and George Jamieson; treasurer, Mr. Robert Hunter; auditors, Messrs. T. M. Cappon and James Hutton. The Chairman, speaking of the past session, said he was not so sure if their departure from the lecture system was altogether wise, as the lectures had always been a benefit. He expressed a hope that the matter of the sketch-book would be taken up by the new council. On the motion of Mr. Charles Ower, seconded by Mr. Keith, the following addition was made to rule 25:—"But members who are practising architects shall constitute a special section of the Institute, with full power to frame their own laws and regulations, and to deal with all questions affecting professional practice." On the motion of Mr. Keith, a hearty vote of thanks was awarded to Mr. Mackison for the way in which he had conducted the work of the Institute during the past year. He expressed the hope that, although Mr. Mackison no longer held office, he would continue to take an interest in the Institute. Mr. Mackison, in reply, thanked the members of council for the assistance they had given him.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE Manchester meeting of the British Archæological Association promises to be one of considerable importance. A strong local committee, of which the Lord Mayor of Manchester is the chairman and Messrs. J. Holme Nicholson and G. C. Yates are the hon. secretaries, has been formed, and the arrangements are in a forward state. The Congress, which lasts a week, opens July 30, when the members will be received by the Lord Mayor. Visits will be paid to the cathedral and Chetham's Hospital, and in the evening a conversazione will be given by the Lord Mayor in the Town Hall. On subsequent days there will be excursions to Chester, Whalley Abbey, Mytton Hall and Church Stydd Chapel, Gawsorth, Congleton, Astbury, Little Moreton Hall, Nantwich, Blackstone Edge, &c. On Friday Sir William Bailey will give a mayoral conversazione in the Peel Park Museum, Salford. Four evening meetings will be held for lectures and papers. These include an address by Mr. Albert Wyon on the "Great Seals of England," which will be illustrated by limelight, and papers by Mr. S. Andrew, Dr. Colley-March, Dr. Hoppell, Mr. W. E. A. Axon and others on "Roman Remains Around Manchester," "The Blackstone Edge Road," "The Visitations of the Plague in Lancashire and Cheshire," &c. The meetings and excursions, it should be said, will be open to ladies, and facilities are given for the attendance of non-members at the evening meetings.

THE CZAR'S MEMORIAL CHAPEL.

A CORRESPONDENT of the *Times* writes:—The Czar and Czarina have returned to Peterhoff from Borki (between Kursk and Kharkoff), where the consecration of the new church of the Saviour, in commemoration of the preservation of the Russian Imperial Family in the terrible railway accident of November 1888, took place on Tuesday morning, June 26. Of all the numerous shrines, chapels and icons set up all over the empire to commemorate the providential escape of the Czar at Borki this one is the most beautiful and striking. The memorial consists of two structures—the one a chapel or oratory built into the side of the railway embankment just where the dining-saloon car containing the Czar and his family was pitched by the accident, and the other a magnificent church in the Muscovite style of the seventeenth century, capable of holding about 700 persons, built a short distance from the embankment out on the open steppe on the spot where their Imperial Majesties helped to alleviate the sufferings of those who had been injured. The church is now surrounded by a park of about 18 acres, in which have been planted 70,000 trees. The entire work has cost about 250,000 roubles (25,000*l.*), collected by public subscription, besides the gifts of land, church ornaments and paintings. The church has the form of a high cupola surrounded by six conical towers, the façades being in yellow bricks, with elaborate ornamentation in which the double-headed eagle plays a conspicuous part. A finely ornamented iron staircase leads down from the railway on either side of the chapel. Within the latter are black marble tablets bearing the names of all those who were killed—namely, 23, and injured 36. Professor Makofsky has spent two years and a half in decorating both the church and chapel with his best work in religious art.

THE TRUE PRINCIPLES OF POINTED OR CHRISTIAN ARCHITECTURE.*

By A. WELBY PUGIN.

THE object of the present lecture is to set forth and explain the true principles of Pointed or Christian architecture, by the knowledge of which you may be enabled to test architectural excellence. The two great rules for design are these:—First, that there should be no features about a building which are not necessary for convenience, construction or propriety; second, that all ornament should consist of enrichment of the essential construction of the building. The neglect of these two rules is the cause of all the bad architecture of the present time. Architectural features are continually tacked on buildings with which they have no connection, merely for the sake of what is termed effect; and ornaments are actually constructed, instead of forming the decoration of construction, to which in good taste they should be always subservient.

In pure architecture the smallest detail should have a meaning or serve a purpose; and even the construction itself should vary with the material employed, and the designs should be adapted to the material in which they are executed.

Strange as it may appear at first sight, it is in Pointed architecture alone that these great principles have been carried out, and I shall be able to illustrate them from the vast cathedral to the simplest erection. Moreover, the architects of the Middle Ages were the first who turned the natural properties of the various materials to their full account, and made their mechanism a vehicle for their art.

We shall have therefore to consider ornament with reference to construction and convenience, and ornament with reference to architectural propriety. Construction must be subdivided and treated under three distinct heads—stone, timber and metal; brick might indeed be added, but as the principles of its construction are similar to those of stone, I shall not make any distinction; and as for plaster, when used for any other purpose than coating walls, it is a mere modern deception, and the trade is not worthy of a distinction.

To begin with stone. A Pointed church is the masterpiece of masonry. It is essentially a stone building; its pillars, its arches, its vaults, its intricate intersections, its ramified tracery, are all peculiar to stone, and could not be consistently executed in any other material. Moreover, the ancient masons obtained great altitude and great extent with a surprising economy of wall and substance; the wonderful strength and solidity of their buildings are the result, not of the quantity or size of the stones employed, but of the art of their disposition. To exhibit the great excellence of these constructions it will be here necessary to draw a comparison between them and those of the far-famed classic shores of Greece. Grecian architecture is essentially wooden in its construction; it originated in wooden buildings, and never did its professors possess either sufficient imagination or skill to conceive any

departure from the original type. Vitruvius shows that their buildings were formerly composed of trunks of trees, with lintels or brestsummers laid across the top, and rafters again resting on them. This is at once the most ancient and barbarous mode of building that can be imagined; it is heavy, and, as I before said, essentially wooden; but is it not extraordinary that when the Greeks commenced building in stone, the properties

A Wooden Building the origin of Greek Temples.

of this material did not suggest to them some different and improved mode of construction? Such, however, was not the case; they set up stone pillars as they had set up trunks of wood; they laid stone lintels as they had laid wood ones, flat across; they even made the construction appear still more similar to wood by carving triglyphs, which are merely a representation of the beam ends. The finest temple of the Greeks is constructed on the same principle as a large wooden cabin. As illustrations of history they are extremely valuable, but as for their being held up as the standard of architectural excellence, and the types from which our present buildings are to be formed, it is a monstrous absurdity, which has originated in the blind admiration of modern times for everything Pagan, to the prejudice and overthrow of Christian art and propriety.

The Greeks erected their columns like the uprights of Stonehenge, just so far apart that the blocks they laid on them would not break by their own weight. The Christian architects,

on the contrary, during the dark ages, with stone scarcely larger than ordinary bricks, threw their lofty vaults from slender pillars across a vast intermediate space, and that at an amazing height, where they had every difficulty of lateral pressure to contend with. This leads me to speak of buttresses, a distinguishing feature of Pointed architecture, and the first we shall consider in detail.

It need hardly be remarked that buttresses are necessary supports to a lofty wall. A wall of 3 feet in thickness, with buttresses projecting 3 feet more at intervals, is much stronger than a wall of 6 feet thick without buttresses. A long unbroken mass of building without light and shade is monotonous and unsightly; it is evident, therefore, that, both for strength and beauty, breaks or projections are necessary in architecture. We will now examine in which style, Christian or Pagan, these have been most successfully carried out. Pointed architecture does not conceal her construction, but beautifies it; classic architecture seeks to conceal instead of decorating it, and therefore has resorted to the use of engaged columns as breaks for strength and effect. Nothing can be worse. A column is an architectural member which should only be employed when a superincumbent weight is required to be sustained without the obstruction of a solid wall, but the moment a wall is built the necessity and propriety of columns cease, and engaged columns always produce the effect of having once been detached, and the intermediate space blocked up afterwards.

A buttress in Pointed architecture at once shows its purpose, and diminishes naturally as it rises and has less to resist. An engaged column, on the contrary, is overhung by a cornice. A buttress, by means of water tables, can be made to project such a distance as to produce a fine effect of light and shade. An engaged column can never project far on account of the cornice, and all the other members, necessarily according with the diameter of the column, would be increased beyond all proportion. I will now leave you to judge in which style the real intention of a buttress is best carried out.

I have yet to speak of flying buttresses, those bold arches, as their name implies, by which the lateral thrust of the nave groining is thrown over the aisles and transferred to the massive lower buttresses. Here again we see the true principles of Christian architecture, by the conversion of an essential support of the building into a light and elegant decoration. Who can stand among the airy arches of Amiens, Cologne, Chartres, Beauvais or Westminster and not be filled with admiration at the mechanical skill and beautiful combination of form

Section of a Pointed Church, with the Flying Buttresses decorated.

Section of St. Paul's, London, a Church built in the revived Pagan style, with the Flying Buttresses concealed by a Screen.

which are united in their construction? But, say the modern critics, they are only props, and a bungling contrivance. Let us examine this. Are the revived pagan buildings constructed with such superior skill as to dispense with these supports? By no means; the clumsy vaults of St. Paul's, London, mere coffered semi-arches, without ribs or intersections, have their flying buttresses; but as this style of architecture does not admit of the great principle of decorating

* Two lectures delivered at St. Marie's, Oscott.

utility, these buttresses, instead of being made ornamental, are concealed by an enormous screen, going entirely round the building. So that, in fact, one half of the edifice is built to conceal the other. Miserable expedient! worthy only of the debased style in which it has been resorted to.

It is proper to remark that the cluster of pinnacles at A are not carried up for mere ornament, but, by their weight, to increase the resistance of the great pinnacle at the point of thrust.

We will now proceed, in the second place, to consider groining and vaulting, which are solely adapted to stone construction.

A groined ceiling is divided into compartments by means of ribs springing from caps or corbels, and uniting in bosses placed at the intersections; the spaces between the ribs are termed spandrels; the word "boss" signifies a spring of water, and has doubtless been applied to the keystones of vaults, as the ribs seem to spring or separate from them.

Here again the great principle of decorating utility is to be observed. A stone ceiling is most essential in a large church, both for durability, security from fire,* and conveyance of sound. It is impossible to conceive stone ceilings better contrived than those of the ancient churches; they are at once light, substantial, beautiful, and lofty.

Groining.

1. They are light, because, their principal strength lying in the ribs, the intermediate spaces or spandrels are filled in with small light stones. 2. They are substantial, for all the stones being cut to a centre and forming portions of a curve, when united they are capable of resisting immense pressure, the keys or bosses wedging all together. 3. They are beautiful, for no ceiling can be conceived more graceful and elegant than a long perspective of lines and arches radiating from exquisitely carved centres. 4. They are lofty, not only on account of the elevation at which they are placed, but that their construction permits the clerestory windows to be carried up level with the crown of the arch in the intermediate spaces.

Pendant.

Boss.

In the groining of the later styles we find a great departure from the severe and consistent principles I have been describing. Henry VII.'s Chapel at Westminster is justly considered one of the most wonderful examples of ingenious construction and elaborate fan groining in the world, but at the same time it exhibits the commencement of the bad taste by constructing the ornament instead of confining it to the enrichment of its construction. I allude to the stone pendants of the ceiling, which are certainly extravagances. A keystone is necessary for the support of arched ribs; the older architects contented themselves with enriching it with foliage or figures, but those of the later styles allowed 4 or 5 feet of unnecessary stone to hang down into the church, and from it to branch out other ribs upwards. This is at most an ingenious trick, and quite unworthy of the severity of Pointed or Christian architecture.†

* Within the last few years the roofs have been burnt off the cathedrals of Rouen, Chartres, and Bruges; and, owing to the strength of the stone vaulting, the interiors of these churches have scarcely been injured; while York Minster has twice been completely gutted within a short period through the want of a stone groining, and yet a mere wood and plaster ceiling has been again constructed.

† This is one among many other symptoms of decline apparent in the later works in the Pointed style. The moment the flat or four-centred arch was introduced, the spirit of Christian architecture was on the wane. Height or the vertical principle, emblematic of the

In the third place we will proceed to the use and intention of pinnacles and spiral terminations. I have little doubt that pinnacles are considered by the majority of persons as mere ornamental excrescences introduced solely for picturesque effect. The very reverse of this is the case, and I shall be able to show you that their introduction is warranted by the soundest principles of construction and design. They should be regarded as answering a double intention, both mystical and natural: their mystical intention is, like other vertical lines and terminations of Christian architecture, to represent an emblem of the Resurrection; their natural intention is that of an upper weathering to throw off rain. The most useful covering for this purpose, and the one that would naturally suggest itself, is of the form represented in the annexed figure: only let this essential form be decorated with a finial and crockets, and we have at once a perfect pinnacle. Now the square piers of which these floriated tops form the terminations are all erected to answer a useful purpose; when they rise from the tops of wall buttresses, they serve as piers to strengthen the parapet, which would be exceedingly weak without some such support. Fig. S.

Pinnacles.

Floriated Pinnacles.

Their utility on the great piers which resist the flying buttresses has been already mentioned under the head of buttress. At the bases of great spires the clusters of pinnacles are also placed to increase strength and resistance; in short, wherever pinnacles are introduced in pure Pointed architecture, they will be found on examination to fulfil a useful end.

The same remarks will apply to the crocketed and floriated terminations of staircase and other turrets, which are in fact ornamented roofs, and I need hardly remark that turrets were not carried up without a legitimate reason.

Every tower built during the pure style of Pointed architecture either was, or was intended to be, surmounted by a spire, which is the natural covering for a tower; a flat roof is both contrary to the spirit of the style, and it is also practically bad. There is no instance before the year 1400 of a church tower

Resurrection, is the very essence of Christian architecture. It was to attain greater elevation with a given width that the Pointed arch was employed; and the four-centred arch does not possess equal advantage in this respect with the old semi; and although some of the later buildings, as King's College Chapel, Cambridge, still retain the principle of internal height with the use of the depressed arch, yet who can avoid being struck with the inconsistency of running up walls to a prodigious elevation, and then, instead of carrying out the principle, and springing a lofty groin, losing a considerable increase of height by a flattened thrusting arched ceiling, the form of which is a sort of contradiction to the height at which it is commenced?

I do not make this observation by way of disparaging the merits of this stupendous building, but merely to show the early decay of the true principles of Pointed architecture which may be traced even in that glorious pile.

Tudor Bulb.

Section of the Dome of St. Paul's.

We not unfrequently find the bulbous form employed in the Tudor period: this, which afterwards became the prevailing form of the Dresden and Flemish steeples, is of the worst possible taste; and why? Because it is a form which does not result from any consistent mode of constructing a covering, and, on the contrary, requires by its shape to be constructed, as will be seen by the sketch; by the side of which I have placed a spire, the severe form and decoration of which are quite consistent with the true principles of rendering the necessary roof or covering of a tower elegant in appearance, without departing from essential construction for the sake of ornament. (Sketch in next part.)

One of the greatest defects of St. Paul's, London, is its fictitious dome. The dome that is seen is not the dome of the church, but a mere construction for effect. At St. Peter's the dome is the actual covering of the building, and is therefore constructed in that respect on

being erected without the intention at least of being covered or surmounted by a spire; and those towers antecedent to that period which we find without such terminations have either been left incomplete for want of funds, weakness in the sub-structure, or some casual impediment—or the spires, which

Pitch of Roofs.

were often of timber covered with lead, have been pulled down for the sake of their material.* In fine, when towers were erected with flat embattled tops, Christian architecture was on the decline, and the omission of the ancient and appropriate

Examples of Ancient Jamb Moulds.

termination was strong evidence of that fact. Towers surmounting gatehouses were never terminated by spires, for

the true principle; but, as will be perceived by the annexed section, the upper part of St. Paul's is mere imposing show, constructed at a vast expense without any legitimate reason.

From the various symptoms of decline which I have shown to have existed in the later Pointed works, I feel convinced that Christian architecture had gone its length, and it must necessarily have destroyed itself by departing from its own principles in the pursuit of novelty, or it must have fallen back on its pure and ancient models. This is quite borne out by existing facts. Now that the Pointed style is reviving, we cannot successfully suggest anything new, but are obliged to return to the spirit of the ancient work.

Indeed, if we view Pointed architecture in its true light as Christian art, as the faith itself is perfect, so are the principles on which it is founded. We may indeed improve in mechanical contrivances to expedite its execution, we may even increase its scale and grandeur; but we can never successfully deviate one tittle from the spirit and principles of Pointed architecture. We must rest content to follow, not to lead; we may indeed widen the road which our Catholic forefathers formed, but we can never depart from their track without a certainty of failure being the result of our presumption.

* The following glorious churches have been stripped of their spires since the views in Dugdale's Monasticon were taken:—Hereford Cathedral, Worcester Cathedral, Southwell Minster, Rochester Cathedral, Ely Cathedral, Ripon Minster, Finchal Abbey, and Lincoln Cathedral. It is to be remembered that those views were taken above a century after the lead-stripping and spire-demolishing period commenced.

being originally built for defence, the space at top was required for that purpose. This is the real reason why square-topped and embattled towers are said to be of a domestic character; so that even by persons unacquainted with the use and intentions of spires, they are associated with the idea of ecclesiastical architecture.

The pitch of roof in Pointed architecture is another subject on which some useful observations may be made. It will be

Square Piers supporting Arches.

Splayed Piers supporting Arches.

found on examination that the most beautiful pitch of a roof or gable end is an inclination sufficiently steep to throw off snow without giving the slate or lead covering too perpendicular a strain, which is formed by two sides on an equilateral triangle.

Modern Jamb Mould, weak and wiry.

French Jamb Mould of the late Styles, extravagantly hollowed.

If this form be departed from, the gable appears either painfully acute or too widely spread. All really beautiful forms in architecture are based on the soundest principles of utility.

Practical men know that flat-pitched roofs, which are exceedingly ugly in appearance, are also but ill calculated to resist the action of weather. In slated roofs especially, gusts of wind actually blow under and lift up the covering; when the pitch is increased to its proper elevation, the whole pressure of the wind is lateral, and forces the covering closer to the roof.

(To be continued.)

THE RESTORATION OF ST. MICHAEL'S CHURCH, LINLITHGOW.

PASSENGERS on the Edinburgh and Glasgow Railway, when looking out from the carriage windows to catch a glance of the historic Palace of Linlithgow, must have also noticed the large, imposing grey church with its square tower, standing on the same eminence and partially hiding the view of this ancient residence of the Kings and Queens of Scotland. This is St. Michael's Parish Church, dedicated to the patron saint of the town, and one of the finest and most complete of the ecclesiastical edifices of Scotland. But of the many people who have visited the palace, so rife with associations of the Stuart Kings—where Margaret mourned the slain at Flodden, and where James and his daughter, Mary Queen of Scots, were born, comparatively few have seen the interior of St. Michael's Church, though its west doorway is within the Royal grounds. One explanation of this is, the *Scotsman* says, that perhaps the good people of Linlithgow were rather ashamed of the state into which the interior had fallen and gave no facilities for the admission of visitors. It was cut up by a brick partition, disfigured by unsuitable galleries, marred by whitewash, and had altogether been allowed to assume an aspect of neglect and decay. This reproach will soon, however, in great part be rolled away. The local conscience has been awakened, and a vigorous effort is at present being made by a committee of heritors and burghers to have the church restored to something like its ancient dignity. To that end a sum of 3,000*l.* has already been raised, which, however, will not cover the cost of a complete restoration of the edifice to its primitive simplicity and dignity such as the committee, having put their hand to the work, might have aimed at; for St. Michael's is a building worthy to rank with the ancient cathedrals of St. Giles, Edinburgh, St. Mungo, Glasgow, or Dunblane. But what is being done is on right lines. The modern partition between nave and chancel has been removed, and the galleries, erected about 1812, when the chancel was fitted up as the parish church, have been cleared away, and with the best results. The inside floor, which had been raised a foot above its original level, burying thereby the bases of the piers, and obliterating the step between it and the chancel, has been lowered, and among other necessary work which will be undertaken will be the rebuilding of the chancel arch, the formation of a heating chamber on the site of the old vestry, the renewing and altering of the heating apparatus, and the reseating of the church. A few weeks ago several gentlemen interested in the preservation of our old ecclesiastical and other buildings visited St. Michael's along with Mr. Honeyman, Glasgow, the architectural adviser of the committee, and suggested that the scheme now in progress should be completed (1) by cutting out a plaster ceiling of late introduction, which took the place of the original open oak roof, and which crushing down upon the clerestory windows dwarfs the height of the interior; (2) that an oak roof should be substituted for the pitch pine at present hidden by the plaster roof; (3) to put in choir stalls and screens; (4) to restore the broken mullions of the triforium; (5) to restore the crown on the tower; and (6) to erect a vestry in harmony with the present building. Mr. Honeyman advised that for other 7,000*l.* these desirable works could be accomplished, but unfortunately at Linlithgow they have not yet found a Dr. Chambers, as at St. Giles, or, as at Dunblane, a wealthy gentlewoman, to bear the cost of the restoration, and a majority of the local committee have not seen their way to incur such a responsibility, though they were urged to do so, and to make an appeal to their fellow-countrymen for funds to carry through so patriotic an object. If the funds are forthcoming, however, they will only be too glad to proceed with the extended scheme.

St. Michael's Church dates from a very early period. At what date a church first existed upon this site is not known. David I., "the sair sanct for the Croun," is credited with having planted one of his many religious houses here. Alexander II. partially rebuilt the church about 1242, and the western tower reaches back to the reign of Robert II., who is said to have contributed 1*l.* 6*s.* 8*d.* towards the expense of its erection. The present church, it is believed, dates from about the middle of the fifteenth century. It is the opinion of experts that the nave, transepts and chancel had been erected from a complete design and within a short period of each other. It has been described as "assuredly the most important specimen of an ancient parochial church now existing in Scotland." The interior dimensions are from east to west 180 feet, from north to south 65 feet; and the transepts—for the church takes the form of a cross—are 100 feet across. The plan comprises a nave of four bays, the transepts, a chancel of three bays and a trigonal apse, with three large Perpendicular four-light windows, which recently were filled in with stained-glass, and constitute a memorial to the late Professor Sir Wyville Thomson, of the *Challenger* Expedition, who was a native of the district. There is a triforium on each side of the nave, with pointed and hooded openings divided into two lights; and in the clerestory

there is a range of two-light windows, with pointed heads, comprised under a semicircular arch, carried right along the walls of nave and choir. There is no triforium in the choir. It may give some better idea of the stately dimensions of St. Michael's when it is mentioned that the central aisle of the nave is rather wider than that of Glasgow Cathedral, or of the cathedrals of Lichfield and Norwich, while the side aisles are about two feet wider than those of St. Giles. The nave and chancel piers are square in plan, moulded at the angles into four heavy rounds, between each of which is a round of a smaller size. Each face thus presents a cluster of three pillars—those of the nave having a lighter and more elegant character than those of the choir. The capitals are plainly moulded, and the masonry above to the triforium string course is simply and in some places rather roughly built. Higher the courses are set with much greater care. The aisles and transepts are vaulted throughout. The groining is simple, though the mouldings are rather fuller than those of the corresponding period in England. The ribs are tied at the intersections with sculptured bosses, on which such devices as the pierced heart and hands and feet, a *fleur de lys*, the cross and crown and the Scottish lion appear, with the bright colours which had adorned them still adhering to them. The arms of the burgh are to be seen in the transepts; but the carving on most of the bosses is now obliterated. The mouldings and the details of the vaulting shafts belong rather to the Decorative period than to the Perpendicular style. The aisle windows are large and are filled with flamboyant tracery, with a pleasing variety of form.

The lower stage of the west tower is open to the church, and contains a large Perpendicular window of three lights in the west face, and a large doorway underneath, in the form of a cross, which forms the principal entrance. Externally this doorway has some fine architectural characteristics. At this end of the church there are a number of exceedingly interesting features worthy the attention of the student of ecclesiastical architecture and archæology. On each side of the main entrance there is a shallow recess containing a stone seat 8 feet in length. Overhead is a canopy formed of soffit foliations. These benches, it is suggested, may have been the beggars' seats. On each side of the tower arch within the nave are two apertures or windows. One of these, it is suggested, was the lepers' window, this idea receiving countenance from the fact that outside the church at this spot there had evidently stood a low covered shed of some kind; or, on the other hand, it may have been the window through which the daily dole was passed to the poor. Between two of the windows of the north aisle of the nave was the royal entrance, now blocked up. Inside, this doorway is quite plain; outside it is ornamented with moulded hood and carvings. It faces a small door on the south front of the palace.

The exterior of the church, while massive and stately in aspect, shows a greater amount of ornamental details than the interior, though, unfortunately, these are only remains of its former greatness. Finely-carved and hooded niches occur all round the buttresses, and in these formerly stood statues of the saints, but they were all destroyed save one, by the Lords of the Congregation, on their march from Perth to Edinburgh. At the same time were cast down, as savouring of Popery, the four-and-twenty altars of which St. Michael's Church could boast. The statuette that was spared was that of St. Michael, the patron saint of the town; and he stands in his niche still, his foot on a dragon, at the south-west end of the church, a little frayed by the hand of time. The gargoyles have also been ruined by wind and weather, or more active agents.

A very beautiful feature of the building is the "Galilee Porch," two storeys in height, with crow-stepped gable, which is built opposite the second bay of the nave on the south side. It has pointed and moulded doorways both outside and opening into the church, and a groined roof ornamented with moulded ribs tied in the crown with a sculptured boss. A sculptured bracket and canopy of large size are affixed to the east inner wall, and a small pictorial bracket, representing an angel bearing an open scroll, appears immediately above the crown of the inner doorway. The upper floor of this *pavil* or porch is known as the priest's room—an apartment 13 feet 6 inches by 11 feet 2 inches, which has round its wall several deeply-recessed cupboards. It has an elegantly corbelled and capped projecting oriel window of three lights, out of which the priest in the olden days would probably put his hands to bless the people as they left the church. At the level of the corbelling, on the outer face of the gable, on each side of the window, are two large canopied niches. The name "Galilee porch" carries the suggestion that here were allowed to gather during service excommunicated persons and others not in full communion with the Church. The entrance to the priest's room is by a newel stair in a turret in the angle between the aisle wall and the porch. At the top of the turret is a doorway opening upon the leads, and a little way along the gutter to the east, and piercing the nave roof dormer-wise, is another small door, which is the only entrance to the triforium on this side.

The south transept, popularly known as St. Katherine's

aisle, is a beautiful part of the interior. Its vaulted roof is ornamented with horizontal and diagonal moulded ribs, the latter springing from single-filleted shafts set in the angles. A stone seat is carried along on both sides; there is a large aumry in the west wall, and two enriched brackets on the wall opposite. The gable of this transept is almost entirely occupied by a six-light window filled with flamboyant tracery of pleasing and effective form. It was in St. Katherine's aisle where King James IV., "very sad and dolorous, making his devotion to God to send him good chance and fortune on his voyage," received the mysterious warning not to go to war with England, which is recorded by Lindsay of Pittscottie in quaint phraseology, and which forms the subject of Sir David Lindsay's tale in "Marmion":—

In Katharine's aisle the monarch knelt,
With sackcloth shirt and iron belt,
And eyes with sorrow streaming.

The warning was delivered by a "ghostly wight" in a white cincture, who stepped from the crowd of knights sitting in the aisle under their banners; but when the surprise which the incident awakened had abated, the augur could nowhere be found. The incident is generally regarded as having an historical basis, and was one of several attempts made in that superstitious age to awe the king into the abandonment of the expedition to England which ended so disastrously for himself and the nation at Flodden. It may not be uninteresting to mention in this connection that, in clearing out the aumry in the aisle, it has been discovered that a shaft of some size goes straight up from it, and if there is an outlet, it must apparently be sought for in the room above. Is there anything here to account for the disappearance of the ghostly wight? One of the other historical incidents connected with the church may just be referred to. It appears that in 1646, when the plague was raging in Edinburgh, the University classes were removed to Linlithgow and conducted in the church, which was partitioned into a number of classrooms for their reception.

The exterior walls of the church are generally in good order, though they bear numerous marks of Cromwellian bullets. It is recorded that when on his march in 1651 to Stirling, after the battle of Dunbar, the Protector took the palace and church from the Royalist garrison after assault, and fortified it on his own account. Some of his soldiers slept in the triforium of the church, the war-horses were stabled in the nave, and trenches were thrown up in the churchyard. Some of these trenches existed until the beginning of this century, for in the minute-book of the heritors there are payments noted at that time for filling them up. Between 1638 and the Restoration the inhabitants of Linlithgow seem to have been subjected to all the rigours of the church discipline of that Spartan period, when the sword of Cæsar was not evoked in vain to uphold the decisions of the Church Courts. An excerpt from the minutes of the kirk session of the period will show how far these were carried. The quotation is from Mr. Waldie's interesting history of the town:—

"1647, May 3.—Ordainis the Bailie thatt visits on the Sabbothe in the foirnoone and lykways the elder who visits in the afternoon to accompany the minister throughe the toun in the afternoon after sermone everie Sabbothe for taking notice who ar att familie exercise or catechizing, reiding or the lyk exercise beseiming the Sabbothe; and who ar not, thatt they according to their fault may be punished.

"Ordainis thatt, upon the Sabbothe, none be sein upon the streat till sex hours att night without ane lawfull occasion otherways to be punished as a Sabbothe breaker."

It was perhaps this repression, coupled with the losses the town sustained by the Cromwell visitation, that caused the burghers to welcome the Restoration with so much joy, the minister of St. Michael's, a certain Mr. Ramsay, along with the Dean of Guild Mylne, having in their zeal crowned the festivities on the occasion by the burning of the Solemn League and Covenant. In the olden Catholic days, St. Michael's, it may be observed, was under the jurisdiction of St. Andrews, and many of its vicars and deans rose to high positions in the Church. It was one of its ex-deans who became a Bishop of Dunkeld, who, for an offence against his office, was adjudged by the Pope to build the apse of St. Michael's Church.

But the damage the church sustained from the reforming zeal of the Lords of the Congregation and Cromwell's troopers was nothing when compared to what the interior received from the vandalism of those who, when art was at a discount in the country, converted the choir into the parish church. The congregation after the Reformation had worshipped in the nave, but about 1812 it was resolved to remove into the chancel. This was done at a cost of about 3,000*l.*, one-third being paid by the heritors, and the other two-thirds by the Town Council. As the partition was at the west side of the transept, the chancel arch, which was thought to be in the way, was taken down and the responds cut clean away. Holes for beams to carry the galleries between the bays were knocked in the aisle walls and in the piers, and in one case at least one of the piers

has been pierced through and through, and has otherwise been so mauled that it is feared it will have to be rebuilt. The bases of the piers and those of the vaulting shafts of the aisle having come in the way of pews and pipes, had been deliberately hacked off; while at a previous period the nave had been smeared with whitewash to such an extent that it required a strong solution of hydrochloric acid to take it off the stone. Interments were frequent in the nave and chancel, and in stripping the pillars and walls there have been laid bare a large series of initials and dates in black paint upon the stone, all relating to the last century, which, it is supposed, constitute a record of burial. There are many sculptured crosses on the aisle walls. These are "dedication crosses," and behind them it is popularly believed there had been placed the relic of some saint.

It is interesting to note that in taking down the partition wall between nave and chancel, the architect found in it, used as rubble, many of the sculptured and moulded stones of the chancel arch. He has thus been able to reconstruct it on paper according to the original design; he has also been fortunate in finding the original place from which the arch sprung; and of its reconstruction a lady has generously offered to bear the entire cost.

Touching the tower, it may only be noted that in the belfry are three bells—one, dedicated to Mary, having been specially cast for the town in 1490, as is set forth on the legend upon it; and that originally the four spirlets at the angles of the battlemented wall head enclosed an Imperial stone crown, which seems to have been taken down early in this century, from the fear that the tower had become too frail to carry its weight. The old engravings of the tower are not all agreed as to the exact form or height which this crown assumed; but one or two of them are of elegant design, and if sufficient money is got the rebuilding of the crown might be considered as part of the restoration scheme.

The restoration of a church so interesting architecturally, and with such a long and varied history, is a work which certainly should be taken part in by the nation at large, and it may again be hoped that the funds will be forthcoming for the purpose.

The officials of the committee in charge of the restoration are Mr. W. H. Henderson, Nether Parkley, chairman of the general committee; Mr. Alexander Turnbull, Hillside, general secretary; Mr. W. Gilkison, British Linen Bank, Linlithgow, treasurer; and the Rev. John Ferguson, The Manse, Linlithgow. The chairman of the executive committee is Mr. Miller Richards of Clarindon, and the secretary Mr. M. W. Henderson.

SURVEYORS' FEES.

AT the Hampshire Assizes the action, Morgan & Endle v. W. B. Hill, was tried before Mr. Justice Wright. Counsel for plaintiffs stated that the defendant was an auctioneer and surveyor, of Southampton, and the action was brought for a sum of money received by him as the proceeds of an auction which he held for the plaintiffs. The defence raised several matters as to which the parties were at variance. It was admitted that the defendant had received a certain sum. Practically, he did not think there was any dispute that the gross sum received had been, as stated by the plaintiffs, 387*l.*, and the defendant had paid into court the sum of 170*l.* and pleaded a set-off and counter-claim as to the rest. In the counter-claim charges were made against the defendant by the plaintiffs as auctioneer and surveyor. The first item he claimed was the sum of 115*l.* 9*s.* 11*d.* for work and labour done and money paid for the plaintiffs. That was the chief item as to which dispute arose, and it occurred in this way. The plaintiffs having acquired a property called Berrywood, near Millbrook Station, they employed the defendant as surveyor, and asked him on what terms he would lay out the property as a building estate, and to lay out the roads. Mr. Hill was also to act as surveyor to the estate, but at that time no work was involved, as there was nothing to do. It was understood Mr. Hill was to act for the estate, and the main thing to do was to set out a plan for the roads, and obtain tenders for making the same. According to the plaintiffs, it was agreed that he should do that on a commission on the amount of the cost of the road—the money expended—and that was to be an inclusive charge. Mr. Hill commenced the work, and submitted specifications, while he also advertised for tenders. The tenders received were not satisfactory, and Messrs. Morgan & Endle stipulated with Mr. Hill that they were not to be bound to accept the lowest or any tender, as they had their own idea of what the work ought to cost. The lowest tender they received was a great deal more than they expected, therefore they did not accept it. Thereupon, some reduction was made by Mr. Hill in the specification, and tenders were again invited, but they were still unsatisfactory. Messrs. Morgan & Endle stated that they would not have the work done at the price, and wished Mr. Hill to obtain further tenders, about which there would be no difference, because Messrs.

Morgan & Endle obtained a tender, and got the work done at a lower sum. Mr. Hill said it was improper and unprofessional to again invite tenders after the amounts had been published, and he would have nothing more to do with the matter, and he did not. There were certain charges made by the defendant in respect to perusing draft agreement, which could not be sustained, as the defendant was not a solicitor, and another item for consulting Messrs. Green & Moberly could not be sustained. It was contemplated that the land should be laid out as a building estate, and Mr. Hill was introduced by one of the plaintiffs to a gentleman named Wilson, who intended to take up the ground and build on it. For Mr. Wilson the defendant did certain work, but the charge had been made out to the plaintiffs, though the work would only benefit Mr. Wilson, who would be prepared to pay. This sum amounted to 30% out of 115%. The other charges were mainly for doing the work for which the plaintiffs said the defendant was to take commission of 5 per cent. on the cost of the road, and which they said had become totally useless in consequence of the defendant withdrawing from the work because they would not accept the tender he wished. The amount of the first tender was 621%, and the roads were ultimately completed at a cost of 380%, and the most the defendant would be entitled to would be 5 per cent. on that, about 19%, which must supersede the whole of the charges the defendant had made. Then there was an item for 25% 7s. 6d. for timber allowed to be taken away from the estate by a man named Score, without being paid for.

The plaintiff stated that in October last year he and his partner acquired Berrywood, and consulted Mr. Hill with respect to laying it out for building purposes.

In cross-examination the witness stated that Mr. Hill did not introduce the plaintiffs to Messrs. Green & Moberly to get them an advance, as they had the money ready. Messrs. Green & Moberly did advance them a loan after they had seen Mr. Hill. The roads had been done by another surveyor, who had put into his hands Mr. Hill's plan. The loan was obtained from Messrs. Green & Moberly to finance the builders on the estate.

Mr. Henry Wilson, a builder, of Bournemouth, stated that he employed Mr. Hill with respect to some houses he built, but Mr. Hill had not sent in his bill.

Mr. Hill, the defendant, said he had laid out scores of estates, and was surveyor to Queen's College, Oxford. He received instructions to sell the house on the estate and the old material, the amount realised by the sale being 382%. Of that amount 43% was bought in by Messrs. Crook & Batten, who afterwards refused to complete the purchase, and that was allowed. With regard to the timber sold to Score, witness refused to allow it to be removed until it was paid for. It was, however, taken away, and witness had not been paid. The amount in all not paid was 71% 15s. Afterwards he had an interview with plaintiffs with respect to laying out the estate. Witness went through the various items, saying he was to have 5 per cent. commission on the making of the road, and the usual other charges. He took his instructions with respect to what was done for Mr. Wilson from Mr. Morgan, though he knew Mr. Wilson was concerned, but he should never think of charging Mr. Wilson. He tendered a cheque for 154% 9s. 7d. to the plaintiffs, and after being kept some time it was returned to him endorsed. Afterwards he tendered 170% in bank notes, which was not accepted, and this sum had been paid into court.

Mr. W. H. Mitchell, architect and surveyor, was called to speak as to the reasonable nature of the charges made, but

His Lordship said all the surveyors in the Kingdom could be called to uphold the charges.

Mr. Burrough Hill, jun., having given evidence to show that the work alleged to be done to the order of Mr. Wilson was by the instructions of Mr. Morgan,

His Lordship stated that there were several different points he should have to submit to the jury, but it was agreed by the counsel on both sides that the case should be settled by the judge, and the jury were discharged.

Mr. Bullen, for defendant, stated that the amount due to the plaintiffs was 15% less than the sum paid into court.

His Lordship generally summed up in favour of Mr. Hill, but struck out one or two items, and reduced others, giving judgment for 52% beyond the amount paid into court, and apportioned the costs.

ARCHITECTS AND DRAINAGE.

IN the Worcester County Court, before Sir R. Harrington, judge, Mr. B. W. Locke sued Messrs. Henry Rowe & Sons, architects, for 12% damages for expense and inconvenience caused by reason of defendants' alleged negligence as architects in the superintendence of the erection of a dwelling-house at Hallow, whereby a drain was laid in such a manner as to prevent proper drainage, in consequence of which the plaintiff was put to the extra expense of 6% 2s. 6d. for having the drain relaid, and also 4% 9s. for doctor's bills for attending members of plaintiff's family, who were suffering from fever caused by the defective drains.

Plaintiff said that in 1890 he contemplated building a house at Hallow, and instructed Messrs. Rowe & Sons to prepare specifications and to carry out the work. The specifications contained provision for laying drains. The work was certified for by Messrs. Rowe & Sons, whose bill of 13% 8s. he paid, and also the contractors' bill. He went to live in the house on August Bank Holiday, 1892, and in a few months found the cellar shoe deep in clear water. It continually flooded the cellar and subsided. In May, 1893, soapsuds and other offensive fluid collected in the cellar, and three weeks later he had the drains taken up. His children were twice attacked with scarlet fever, at an interval of about twelve months, the water in the cellar smelling very badly. Mr. Polson's bill for attendance amounted to 4% 9s. He had the drain taken up, and found that the connection with the culvert was laid so that it would meet the flush instead of going in the same direction with it. Since the relaying of the pipes he had had no cause of complaint.

In cross-examination plaintiff said three months were allowed to elapse after he went into the house and before the final payment was made to the contractor in order to see that the work was satisfactorily done.

In reply to his honour plaintiff said that he bought the house through an advance of a building society, who, however, did not have anything to do with the plans.

A labourer said that on uncovering the pipe he found the end "cocked up" into the culvert. The pipe was choked up with mud and black water. Corroborative evidence having been given,

For the defence it was pointed out that almost three years elapsed before the architects had any notice of defects in the drain. It was unreasonable to suppose that an architect if he did his duty—as he submitted Messrs. Rowe & Sons had done theirs—should be held responsible for any defect that might arise at that period of time. Counsel was proceeding to speak of the illness of the children, when his Honour remarked that there was no evidence that their illness was due to the drains. Counsel urged that what stopped the pipe was not matter from the culvert, but was due to Mr. Locke's lack of proper attention and flushing of the pipe. Messrs. Rowe would, if they had thought they were in the wrong, have compensated Mr. Locke, but they denied that they were, and desired to vindicate their reputation.

Mr. A. B. Rowe, of the defendant firm, said that when the excavations were being made a spring was met in the cellar, and the drainage-pipe had to be lowered some 4 feet. The pipe was 90 yards long and had a fall of 20 inches. He and his assistants visited the house several times during its erection, and no complaint was received within three months of the erection. The pipe was sufficient to carry down the surface and scullery water. He had nothing to do with the connection of a stable drain from the premises of Mr. Lord—through whose orchard plaintiff's pipe was carried—to Mr. Locke's. The pipe ought to have been flushed frequently, or matter would accumulate in it.

Corroborative evidence having been given, the Judge pointed out that the architects' duty in this case was to exercise a general superintendence, and not discharge the function of a clerk of works, who had to continually check the work of those under him. There was no evidence connecting the illness of the plaintiff's family with the drain—the illness (scarlet fever) might be aggravated by a bad drain, but must be communicated. If they thought that the advice given by Mr. Rowe was not unskilful, then they would return a verdict for the defendants; on the other hand, if they thought plaintiff was entitled to damages the 6% 2s. 6d. seemed a fair sum.

After considering the evidence for about half an hour, the jury stated that they were unable to agree. The Judge asked whether the parties were prepared to take the verdict of the majority. Eventually it was agreed to take the judge's decision, which would be given at a later period.

A SCIENTIFIC LABORATORY.

THE monthly general meeting of the Royal Institution, held on Monday, had the agreeable duty, says the *Times*, of confirming the acceptance by the managers of the offer by Mr. Ludwig Mond of one of the most munificent endowments of scientific research that has ever sprung, in this country at all events, from the liberality of a private citizen.

Mr. Mond last year bought the large freehold house, No. 20 Albemarle Street, contiguous to the buildings of the Royal Institution, and formerly the residence of the Earl of Albemarle. This house he has resolved to convey in fee simple to the Royal Institution. He further proposes to defray the whole expense of converting it from its present uses into a laboratory of chemical and physical research, to be called the Davy-Faraday Research Laboratory, and of equipping it with everything needful for the conducting of scientific research upon a large scale. In addition to this he proposes to endow

the new laboratory first with an income sufficient to defray all the expenses of rates, taxes and maintenance; and, secondly, with a further and of course much larger income, sufficient to pay the salaries and incidental expenses of a trained scientific staff, and generally to carry on the work of an institution of this kind in an adequate and business-like manner.

By this generous offer, the financial magnitude of which will be appreciated by all who are conversant with the necessities of a scientific establishment on so large a scale, Mr. Mond realises an idea which engaged the attention of Faraday and Brande and the managers of the Royal Institution half a century ago. In the year 1843 a proposal was made to establish at the Royal Institution a school of practical chemistry, which was not only to give practical and systematic instruction to students, but was also to provide a place where original researches could be conducted by individuals skilled in manipulation, and where the professors could work out their problems by the aid of many qualified hands.

This proposal was submitted by the managers of the Royal Institution to Professors Faraday and Brande, who expressed their strong approval of the end proposed and their desire that it might be carried out at the Royal Institution "if it could be done well." But on a closer examination of the limited space within the walls of the Institution it appeared impracticable to afford accommodation for carrying out the proposed scheme.

In 1846 the Royal College of Chemistry was founded, and since that time numerous schools for the teaching of practical chemistry have been established all over the country. These, however, only cope with the first part of the scheme recommended in 1843, while as to the second part—viz. founding a laboratory for the carrying out of independent and systematic researches—no adequate provision exists in England.

Mr. Mond has felt that the need for such a laboratory has become greater and greater since the work of the scientific investigator has become more and more subtle and exact, and in consequence requires instruments of precision and a variety of facilities which a private laboratory can very rarely command. It has been his desire for many years to found a public laboratory which shall give to the devotees of pure science, anxious and willing to follow in the footsteps of the illustrious men who have built up the proud edifice of modern science, the facilities necessary for research in chemistry, and more particularly in that branch of the science called physical chemistry. He has come to the same conclusion as the promoters of the scheme of 1843, viz. that such a laboratory would still have the greatest prospect of success under the ægis of the Royal Institution; that, in fact, it would be the consummation of the work which this great Institution has been fostering in its own laboratory with such remarkable results by the aid of the eminent men whose services it has always been fortunate enough to procure.

He accordingly places the Davy-Faraday Laboratory under the management of a committee, nominated by the managers of the Royal Institution from among themselves and reporting to them. While the laboratory will have a competent chief of its own, devoting all his time to its work, Mr. Mond desires that the resident professor at the Royal Institution should accept the position of director, thus further strengthening the ties between the Royal Institution and the laboratory as well as insuring for the latter all the aid it is in the power of the Royal Institution to afford.

The laboratory is to be free to all persons, without distinction of sex or nationality who, in the opinion of the managers of the Royal Institution, are fully qualified to undertake scientific investigation, preference being naturally given to those who have actually done original work.

After providing for all the needs of the Davy-Faraday Research Laboratory, the house given by Mr. Mond to the Royal Institution will afford space sufficient to provide a considerable addition to the accommodation of the Royal Institution itself. Such an extension of its premises is particularly needed to make room for its growing library and also for the chemical laboratory, where the powerful apparatus required for such investigations as those so brilliantly carried on by Professor Dewar demand space undreamed of by the chemists of an earlier generation.

Having thus at once added greatly to the resources of the Royal Institution itself and made provision for a laboratory of research free to all competent investigators from the outside, Mr. Mond hopes that others may come forward to take the further step of founding scholarships and bursaries for the benefit of promising students who may not possess the means to avail themselves of the great opportunities now offered. If liberality as modest as it is magnificent—for it will be noted that Mr. Mond does not even attach his name to this splendid foundation—can avail to stimulate the generosity of those to whom science has been a bountiful foster-mother, the laboratory now founded will become the most appropriate of conceivable memorials to the great chemists from whom it takes its name; while the Royal Institution, where they laid the foundations of knowledge to which this country owes an incalculable addition

to its prosperity, will enter upon the second century of its existence with the brightest prospects of redoubled vitality and usefulness.

HORNSEY LOCAL BOARD.

THE following resolution was unanimously passed at the meeting just held: "That the board in accepting the resignation of Mr. Thomas de Courcy Meade, M.I.C.E., on his appointment as city surveyor of Manchester, desire to place on record that he has been in their service as engineer and surveyor for more than thirteen years (having previously been their assistant surveyor for a few months), and that during the period for which he has held that position he has conducted the business of his office not only with the most scrupulous fidelity but with great ability and credit to himself, and with undoubted advantage to the whole of the district under the jurisdiction of the Hornsey Local Board, the improvement in the sanitary condition of which is evidenced by the reduction of its death-rate in the last ten years from 13.6 per 1,000 inhabitants to 11.33, notwithstanding its immense growth and development. During that time he has carried out many engineering and architectural works of considerable importance, and these, with the making up of many miles of roads and works of sewerage, are represented by an expenditure of about half a million of money. The board in parting with Mr. Meade wish him every prosperity in his new and honourable position of chief surveyor to the Corporation of the City of Manchester." All who know Mr. de Courcy Meade will join in wishing him prosperity.

CARDIFF NATURALISTS' SOCIETY.

THE members of the Cardiff Naturalists' Society have just held their annual "field day," to which ladies were invited, a visit being paid to the Golden Valley, one of the most beautiful stretches of country in Herefordshire, lying between Pontrilas and Hay. A large number—little short of 100—left by the 9.30 train, and after visiting Clifford, Peterchurch and Vowchurch, and having lunched at Hay, reached Abby Dore late in the afternoon. A visit was paid to the remarkable church there, which was described by the vicar, the Rev. A. Phillips, and after this the annual meeting was held. The chief item of business was the election of president for the ensuing year, Mr. R. W. Atkinson, B.S.C., being unanimously chosen to fill the office. The party then proceeded to Pontrilas for tea. During the meal Canon Thompson made an eloquent appeal for assistance for the archaeological section to continue their researches at the Ely racecourse, where a Roman villa has been discovered. Mr. Edwin Seward, the president, Mr. T. H. Thomas, and Mr. W. Cook, the hon. secretary, each enforced the value and importance of the work which had been undertaken. It was announced that Mrs. Vaughan, of the Deanery, Llandaff, had subscribed 10s., and a large subscription list was at once filled up. The Society returned to Cardiff at ten o'clock, after a most enjoyable day.

GENERAL.

Mr. Ralph Nevill, F.S.A., of 89 Chancery Lane, has been appointed architect for the new church of All Saints, Norfolk Square, that is to replace the one recently destroyed by fire.

The Trustees of the National Gallery bought at the sale of the Adrian Hope Collection on Saturday *A View in Haarlem*, by Gerrit Barkheyden, for 450 guineas, and *A Scene on a Terrace*, by Jan Steen, for 780 guineas.

Ledbury Church, Herefordshire, is to be restored if 5,000s. can be raised. About 3,000s. has been collected. Many of the windows are in so dangerous a state that the loss of the beautiful tracery is imminent.

The Duke of York on Tuesday laid the memorial stone of the Cripplegate Foundation Institute, containing a reading-room, news-room, &c., on the west side of Golden Lane. The building is to be erected from designs by Mr. Sidney R. J. Smith.

A Study for "The Old Gate," by the late Frederick Walker, A.R.A., has been purchased for the Corporation Gallery, Birmingham.

Herr Georg Ebers, the Egyptologist and novelist, has invited men of culture in all lands to unite with him in a protest against the contemplated destruction of the temples on the island of Philæ.

The Award of Mr. Philip E. Pilditch, the arbitrator in the case of O'Brien v. Metcalfe, relative to the dilapidations accrued at Aston House, Stevenage, in which the surveyors engaged on either side were Messrs. Walton & Lee and Mr. Charles E. Sayer, has just been published, the amount of award being 547l. 7s.

The late Mr. John Scott, of Hunslet, has, it is announced, left 10,000s. for the erection of almshouses in Leeds.

The Architect.

THE WEEK.

THE Governors of Christ's Hospital may well be trusted to make the best arrangements for the prosperity of the institution. They have had a difficult task during the past few years. For that reason we consider the promoters of the meeting which was held on Wednesday at the Mansion House were rather impolitic in their endeavours to compel the Governors to announce the details of their contemplated measures. It is not likely that English men of business would purchase eleven hundred acres at Horsham if they were not in a position to utilise the ground. We do not give unreserved approval to the choice of such a site, for if the buildings are to be safe it will be necessary to lay out a larger sum on concrete foundations than has been anticipated. The land was not a profitable farm for the dairy company, and unless costly precautions are taken it may not be the most eligible of building sites that are obtainable about London. But that the Governors did not realise what was before them we cannot believe. Then, again, it must have been anticipated that the schools would need the expenditure of a large sum of money before they were erected, and it may be assumed that the Governors have provided for the emergency. The tact shown in meeting the objections which were raised on account of the unsanitary condition of the buildings in Newgate Street is evidence of the skill acquired in commercial affairs. To say that "information is wanting as to the source from whence the funds are to come to provide expensive new school buildings, but the Governing Body will naturally feel hesitation about embarking on this expenditure on the subject" is a platitude which is not worthy of Sir SYDNEY WATERLOW and the other requisitionists. It would be better if they proposed to raise money to extend the operations of the Governing Body. The speakers, however, were what are often called Job's comforters. Bankruptcy and ruin is predicted by those adverse to the change, and the meeting endorsed the resolution that the proposed new schools should not be proceeded with.

THE annual meeting of the subscribers to the British School at Athens was held on Wednesday at 22 Albemarle Street, Mr. BRYCE, M.P., in the chair. The names of distinguished personages present make a long list, and it may be mentioned that Mr. F. C. PENROSE, F.R.I.B.A., attended. An impression that forces itself once again on our mind is the paltry support given to art by this country, whether by individuals or by the State. It can scarcely be denied that a very limited view is taken of what art is. Art as understood in this country means, broadly speaking, the production of pictures. Until a more enlightened view is taken it is hopeless to expect the public or the State to spend money except in the purchase of pictures. Our space this week will not allow of entering into details, but the position of our British School of Archaeology in regard to financial support is in strange contrast to the aid so generously given by other nations and empires to their schools in Athens. It is creditable that private enterprise has enabled so much to be done by the kind and liberal subscriptions of the few.

A CASE was recently brought before the Sheriff's Court in Inverness in which a contractor claimed 15% from a local artist for preparing plans and specifications of a cottage villa. The defence was that the specification was so imperfect it was no guidance to the builders, and that in any event the sum charged was excessive, as 5% would be a reasonable sum. The Sheriff found that in the absence of a special agreement, reasonable compensation should be given, and he assessed the amount at 8% 8s. with costs. In laying down the law the judge said:—"Generally, architects are paid by a commission of so much per cent. on the outlay, and the Institute of British Architects have issued a set of rules dealing with professional charges, but these rules have no binding effect in law unless they are made part of an agreement between the

architect and his employer. In the present case, there was no express agreement between the parties as to remuneration, and the rules of the Institute were apparently not known to the defendant. They certainly were not referred to by the plaintiff in any of his interviews with the defendants. Notwithstanding the adverse criticism of some of the defendant's witnesses, I think it has been proved that the plaintiff's plans were good, and quite sufficient to enable the contractors to carry out the work contemplated."

THE destruction of the Brussels music-hall called the Palais d'Été on Wednesday morning should serve as a warning to municipal authorities in England. In Brussels, as in most continental cities, the theatres are closed in July, and pleasure-seekers in consequence are driven to music-halls, which they avoid at other times. The Palais d'Été might be considered as part of the Brussels Markets, or Halles Centrales, but it was none the less flimsy on that account. The flames were first perceived at 3 30 A.M., and in an incredibly brief time the whole building was a ruin. In fact, the few firemen who were able to reach the street were in great danger from the falling materials. Beneath the hall was the freezing chamber of the city, but cold air could have no effect on the fire. The water supply was also deficient. Brussels is supposed to be a well-built city, and in no place could fireproof construction be attained on more economical terms. Yet in an important quarter of the city it is found that a sort of public building could not withstand a fire for a single hour. If the accident had occurred five hours earlier the loss of life would have been appalling. Building committees in London and English towns should not forget what has taken place in Brussels, and it is their duty to insist that all music-halls are rendered sufficiently secure at least for as long a time as is required to allow an audience to depart in safety.

THE Belgian Government has declined to authorise the commune of Schaerbeek, one of the suburbs of Brussels, to raise the money that is necessary for the erection of the proposed hospital. Fortunately one of the residents of the commune, M. CAROLY, has come forward and has undertaken to defray all the expenses. His first donation is 20,000%, but of course that will be only a fraction of what will be needed. In consequence of his liberality the hospital will bear his name. The works will be started immediately. The site is excellent, between the highways of Haecht and Helmet.

WHEN it was first proposed to set up one of the ordinary Munich windows in the hall of the Stationers' Company we protested against the proposal, for an ancient Company should not set the example of going abroad for work which could be easily obtained in England. It may be wrong, perhaps, to put the case in that way, for the commonest English stained-glass reveals aspirations which are not found in the mechanical products of German manufacturers. But the latter are liberal to an excess in providing strong colours, and it is to be feared that the Worshipful Company of Stationers are no more able to resist their influence than the African races. That men who have a sort of commercial connection with literature should be in that condition may seem to be deplorable, but it should be remembered that printers and publishers are rarely acquainted with the works which bear their names. That the Lord Mayor should have unveiled a foreign window is to be regretted, for it would be better if he did not allow his loyalty as a member to gain the upper hand. The Chief Magistrate of London ought to utilise the strength of his official position for the encouragement of English art and industry.

THE French Minister of Public Instruction has given a commission to M. BOUCHER, the sculptor, to prepare a bust of the new President of the Republic, M. CASIMIR-PERIER. The work will become the property of the Administration des Beaux-Arts, and will be reproduced in porcelain at Sèvres. The copies will be distributed, in order that they may be placed in the public and municipal offices throughout France.

IS GOTHIC ARCHITECTURE A FAILURE?—II.

[BY A CORRESPONDENT.]

IN Gothic buildings the addition of a label over a single-light window, or one of several lights divided by mullions, is, of course, not only architecturally effective, but is in a place where it suggests most protection from rain. In Classic work, although an architrave to some extent serves the same object, it does not project so much, and it is believed there are no examples of it being stopped in the same place as the label is in Mediæval buildings, *i.e.* by a head, mask, knot of foliage, or other ornamental termination; for the architrave is either continued down the jambs or stops on a continuous horizontal member, or on a capital. In Classic architecture a pediment to some degree supplies the place of the Gothic hood-mould or label, but of necessity in a much more elaborate and costly way. The very common practice of "scooping out" the apex of the pediment and sticking in a bust, vase or other ornament, entirely does away with the *raison d'être* of the pediment, and can only be defended on the ground of its looking "picturesque," which to the writer appears absurd. However, this innovation is of very old standing; so it is supposed that people have forgotten that it is not found in the more ancient Classic examples. The Mediæval label was, for obvious reasons, never mutilated like the pediment so often is. If the architect were more careful to suggest a meaning to his details such things would not happen. To insist dogmatically on every feature to the exterior of a building being so designed as best to withstand the assaults of the weather would be manifest folly. But it is well to think of practical matters where architectural effect is not thereby injured. In English thirteenth-century work the mouldings are frequently much undercut. Now, in the case of a circular or vesica-shaped form of opening, placed at a height considerably above the eye, where it could not be looked down upon, except from a balloon or by means of a ladder, such hollows would only collect water, and by the action of frost speedily tend towards the destruction of the contiguous mouldings and masonry. This was foreseen by our Mediæval forefathers, and the hollows were omitted when they ceased to be visible from down below, while the stone was worked so as to throw off the rain-water instead of retaining it. The writer is speaking not "without book," as he found this precaution taken in the case of a great church, where scaffolding had been put up for the purpose of general reparation to the fabric. But "*Retournons-nous à nos moutons*," or in other words the consideration of the mullion question. Its origin is most probably to be found in ecclesiastical architecture rather than in secular or domestic buildings, to which, however, it was rapidly appropriated owing to its convenience. As is well known, it was the mullion which undoubtedly prompted the invention of window tracery. It was too useful a feature not to be laid hold of by the Renaissance architects, and in the Châteaux on the Loire and elsewhere mullions were transformed into something like miniature pilasters with excellent effect.

It would be quite impossible, when discussing the subject "*Is Gothic Architecture a Failure?*" to avoid alluding, in passing, to the two certainly most important modern secular buildings in the Metropolis—the Houses of Parliament and the New Law Courts. The merits and demerits of the former have been abundantly and exhaustively criticised since the magnificent pile was first erected. So it would be superfluous to again go over such well-trodden ground. The talented architect of the latter was so comparatively recently taken away from us that the writer (who had the great privilege of some personal acquaintance with him) thinks it better not to discuss its qualities. Its designer, as is well known, was beset with unusual difficulties in his gigantic task. The remarks sometimes made by some of the legal profession and by the public at large are therefore unreasonable. The architect cannot be said to have had quite fair play in rendering the Law Courts a specimen of what a fine secular Gothic building ought to be. Sir CHARLES BARRY does not appear to have been hampered in the same way in the case of the Palace at Westminster.

The very masterly way in which Sir CHRISTOPHER

WREN contrived to get some approach to the skyline of a Gothic spire, and a general pyramidal contour when that style was at a discount, cannot but excite admiration in the mind of the most rigid Mediæval purist. For WREN showed true inventiveness and also a spirit of adaptation in employing and rearranging Italian detail, which is far better than to have attempted the impossible, and simply classicised a Gothic framework. He was also ably followed by his pupils, to whom London is indebted for some beautiful examples of Renaissance spires. But the origin of this most pleasing feature in our Mediæval churches was almost lost sight of, owing to the manner in which storey upon storey in these Classic structures was piled up. For looking at the most elaborate and latest examples of spires during the Gothic period, the *motif* of a prolongation of the original pyramidal roof to the tower, greatly altered it is true, is still very apparent to those who seek for it. In some of the village churches in the neighbourhood of Caen the sudden jump from the wood pyramid to that carried out in stone is very noticeable. The latter, unadorned, must of necessity have a crude and heavy appearance. But the English manner of throwing squinches across the angles of the tower and arriving at an octagonal plan in preparation for the spire, gracefully forming the outward junction of the two by means of a broach or other appropriate means, is far happier. Of course, later on, the French spires soon acquired a graceful outline, as it is only in the early stage that these low plain stone pyramids are found. WREN and his school have left to us in their spires essentially English and original compositions, owing to the able manner in which the various features of Renaissance work were welded together. But their utmost efforts unquestionably left the older type the better, because that was founded on the right principle of spire growth that is observable, as has been pointed out, from the earliest to the latest examples. As a rule a horizontal slice through a Gothic spire, and lifting the upper part off, would result in its hopeless mutilation. But that would not really be so ruinous a process in some of those of the Wrenian character. This shows an element of weakness in their design, and a departure from the ideal of which a spire should be.

When the power of the Roman, and then Greek, styles of architecture, as practised in this country, had been shaken, and the absurdity of gloomy porticoes from ground-line to cornice, as well as of the low-pitched or almost invisible roofs had been at last brought home to the public, the gables and high-pitched roofs of Mediæval times, so suitable to our climate, were re-introduced. Notwithstanding the revival of Classic architecture shown in the buildings of François Premier of France and in our Elizabethan period, the lofty roofs were sensibly retained, and, in fact, in the Châteaux on the Loire made even more of by utilising them for rooms, and forming charming features owing to the way in which dormer windows of picturesque design were introduced. Our street architecture has greatly benefited by this enlargement of the use of the Mediæval high-pitched roof, which has done more towards abolishing the monotony of London streets than almost any other feature, consequent on the variety given to what was formerly a nearly dead level of skyline.

There is a structural feature, often very important, that is essentially a Gothic invention, *viz.* the buttress, which in its true character did not exist in Classic times. For it was then used as a pilaster, and therefore had little projection or real ability for substantial work. As walls were then of such ample thickness at a period when labour and materials were cheap, while time was not such an object as at the present day, the want of buttresses could not have been so appreciably felt. In some very early Mediæval buttresses, such as at St. Remi, Rheims, and at St. Peter's Church, Northampton, semicircular projections attached to the walls externally were the forerunners of what afterwards became the regular buttress. This was probably at the onset suggested by the Classic engaged column. In Norman and Early English work the same idea, somewhat modified, appears in the nook-shafts at the angles of buttresses. In secular and domestic architecture this feature is in many cases not required. But when employed and treated with due judgment it has telling effect. One does not necessarily look for ornamentation in a buttress, for its *raison d'être* makes it require good width and projection, and these

features in themselves, with the use of well-designed water-tables, inserted at the proper places, form decorative adjuncts. There are, it need scarcely be said, buttresses *and* buttresses. Some absolutely injure the effect of the buildings to which they are attached owing to the clumsy manner, artistically speaking, in which they have been treated. It is a task for the modern Free Renaissance architect to devise a way of grafting a useful as well as effective buttress on to his building, where really wanted, without attempting to Gothicise it. When the bright sunlight strikes on a long flat front of wall, destitute of any substantial projection, the addition of a buttress supplies something very desirable. In many of the picturesque churches in Surrey, Sussex and other counties, however, where freestone was scarce but abundance of flints to be had, the builders of the Middle Ages judiciously dispensed with buttresses, owing to the expense and difficulty of procuring proper quoins for the angles. The ordinary local materials being cheap and handy, the necessary amount of stability was obtained by very thick walls. This was a sensible proceeding on the part of those who reared these churches, wiser men in this respect than some of their successors. Where the buttress fulfils a proper constructional function, it is to be heartily welcomed as a valuable artistic help to the exterior.

There can scarcely be a prouder architectural distinction to this country than the development of the abacus, &c. (the crowning member of the capital) during the early period of the growth of the Gothic styles. The inconvenience often caused by the square plan of this moulding was at first tentatively got over by splaying off the angles to a small extent at 45 degrees, so as to form an irregular octagon. But this slight modification speedily failed to satisfy the aspirations of the seekers after expansion from hard-and-fast lines. So a bold leap was taken and the circular abacus adopted, which plan the mouldings of the capital, and also of the carving, when employed, followed. At Wells Cathedral the history of the progress of this most important innovation is well shown—the earlier form in the capitals of the nave arcade and that which succeeded it in the exterior of the great west front. Such a departure necessarily affected the plan of the arch mouldings, and produced that novel and immense variety in its members in which the thirteenth century revels, oftentimes with an exuberance that not only might well have been spared, but which would have resulted in better effect had rather more restraint been exercised. It was, in fact, a case of a good thing overdone. As an Englishman with considerable knowledge of our native architecture—as one, too, who has studied French, German, Belgian, Dutch, Swiss, Italian, and Spanish work in their own countries—the writer has never seen anything to equal the treatment of thirteenth-century mouldings, where they have been designed in proper groups and on a well-considered principle.

(To be continued.)

PRESERVATION OF CITY CHURCHES.

THE Lord Mayor presided at the public meeting held at the Mansion House to promote the objects of the City Church Preservation Society. Dr. Edwin Freshfield proposed a resolution to the effect that the meeting, while favourable to a much-needed reform in the ecclesiastical arrangements of the City, was of opinion that any further destruction of churches and desecration of sites was to be deplored, and must be strenuously resisted. Professor Shuttleworth seconded the resolution, maintaining that the City churches were absolutely unique in the ecclesiastical architecture of Europe—he might say of the world—and he opposed the removal of the City churches on antiquarian, architectural and archaeological grounds. It was sometimes said that the City churches were of no use. He did not believe one word of it, but if there were any that were useless they must be made useful. Mr. Lefevre and Captain Baker proposed to insert, after the word “deplored,” the words “except in connection with City and sanitary improvements,” but the suggested addition fell through, and the motion was then adopted. Mr. Neave Hill afterwards proposed a resolution expressing regret at the attempt now being made to bring about the destruction of the church of St. Ethelburga, in view of its great historical interest and practical value. Mr. H. C. Richards, in seconding the motion, observed that if, as some contended, City churches were to be removed because at the present time they had no congregations, St. Paul’s Cathedral ought to have been removed thirty-

five years ago. A gentleman had informed him that on a Christmas Day in the sixties he was one of two communicants there, but they all knew what St. Paul’s Cathedral was to-day. The resolution was carried.

The Bishop of Winchester and Dean Kitchin have put forth a proposal for the conversion of Wolvesey Palace, Winchester, into a diocesan church-house. The palace lies close to the river Itchen, between Winchester College and the deanery gardens, and for some years was hired by the authorities of Winchester College for educational purposes. Two years ago the Bishop was desirous of selling the palace to the governing body of Winchester College, intending out of the proceeds to purchase or hire a residence in the cathedral city, but the Ecclesiastical Commissioners did not see their way to alienate from the custody of the see a property of such historic interest.

FUNCTIONS OF THE ART UNION OF LONDON.

THIS Society, who contended that they were not liable to be assessed for local rates, and who had judgment given against them in the Divisional Court when the case came before Mr. Justice Wright and Mr. Justice Collins, have carried their case to the Court of Appeal, and on Monday the Master of the Rolls and Lord Justice Kay decided in favour of the Society, Lord Justice A. L. Smith dissenting. In giving judgment, the Master of the Rolls said that it was contended that, from the manner in which the Society had exercised its powers, it was not a Society instituted for the purposes of the advancement of the fine arts exclusively. That drove them to consider what it was that this Society had done, and what was its constitution and usage. That it was a Society for the advancement of art could hardly be denied, and, moreover, the Society had obtained the certificate to that effect from the barrister which the Act required. But the authorities showed that in questions of rating the Court were not bound by the certificate so given. Therefore they had to examine the matter for themselves. The Society was constituted to take cognisance of works of art in painting, and to do what it could to promote that art. The way in which it did it was to select one of the best pictures of the year from one of the various exhibitions and purchase it. It did not sell the picture, but had it engraved and had a sufficient number of copies taken to give each subscriber a copy. Then if the Society had money enough it allowed a subscriber, who was chosen by lot, to select a picture for himself of a certain value, and when selected the Society bought the picture from the artist and gave it to the subscriber. If the subscriber selected a picture above the limited value he would pay the extra sum out of his own pocket, but that consideration appeared to him (the Master of the Rolls) to be immaterial. In his opinion this was a Society instituted for the advancement of the fine arts exclusively. The Society must further be supported wholly or in part by annual “voluntary contributions.” What was the meaning of “voluntary” in this Act? The antithesis or voluntary was compulsory. In *Churchwardens of Birmingham v. Shaw* (10 Q.B. 868) the Court construed the word as being the antithesis of compulsory. Then what was the meaning of “contributions?” If a person bought a thing he did not contribute to it. Contribution was a payment towards some general object. If it was a payment for a thing purchased it was not a contribution. If the cases were examined in which the society had a reading-room or such like it would appear that there was a payment and not a contribution. Taking both words together, if the members paid the subscription voluntarily and continued to do so, though not bound to do so, it was a “voluntary contribution.” The members here were not bound to pay nor to continue paying, and when they paid they did not pay for any particular thing. They subscribed to support the Art Union, and if so, it was not a payment but a contribution, and a voluntary contribution. It might be said that the proper inference of fact was that the members who subscribed did so, not for the purpose of advancing art, but for the purpose of a gambling chance. But the Legislature had exempted the Society from the Lottery Acts. If the Legislature had thought the distributing the picture by chance had altered these societies into gambling societies it would never have legalised them. The Legislature must have been of opinion that it was not in reality a lottery, though coming within the strict words of the Lottery Act, but only a means of distributing a work of art. Speaking for himself, it was an untrue inference to draw that all the persons who subscribed to an art union did so for the purpose of purchasing a chance of getting a picture. They really and truly paid to support the Society for the advancement of art, and did not pay the money for the purchase of an article. The contributions were therefore in every sense contributions and not payments. They were voluntary contributions. The Society was therefore exempt, and the appeal must be allowed.

Lord Justice Kay read a judgment to the same effect.

Lord Justice A. L. Smith said the first question was whether the Art Union of London was instituted for the purposes of the fine arts exclusively. In *Commissioners of Inland Revenue v. Forrest* (15 App. Cas. 339), Lord Watson said:—"The society must be one instituted exclusively for the purpose of science, literature or the fine arts. . . . It is not sufficient compliance with the plain language of the Act that a society be established chiefly for the purpose of promoting science, literature or the fine arts. One or other of these must be its exclusive object; so that an institution which also contemplated some other, though altogether subsidiary, object, could not claim the benefit of the exemption." That meant that if the other object be an object distinct from and not connected with the fine arts, then the society had not as its exclusive object the promotion of the fine arts; but, if the other object be only a means to the one end—that is, as in this case, a lottery whereby to draw money from the public for the promotion of the fine arts—then the society had one sole and exclusive object, namely, the promotion of the fine arts, and not another subsidiary thereto. Upon consideration his lordship said that the right conclusion was that the object of the Art Union of London was the promotion of the fine arts exclusively, though, as incidental to that object, the lottery was brought into play and some painters and artists were benefited whose works happened to be appreciated. As regards the second question—whether the Society was supported wholly or in part by annual voluntary contributions—his lordship, after referring to the definition of voluntary contributions given in *Commissioners of Inland Revenue v. Forrest*, said that the words "annual voluntary contributions" must have some limitation placed upon them other than that of compulsory contributions. He would not attempt an exhaustive definition; but he would take the concrete case of the annual contributions to hospitals which were supported by voluntary contributions, and, in his opinion, these were the kind of contributions aimed at by the Act. If the payment was made to a society for value received or expected to be received—that is, that the object of the subscriber was to obtain material advantage to himself—then it was not a society supported wholly or in part by annual voluntary contributions so as to come within the exemption in the Act; but, if the contribution be made by way of gift from disinterested motives for the benefit of others, it did. All contributions to societies instituted for the purpose of science, literature, or the fine arts exclusively were made in one sense voluntarily, in that they were not made compulsorily. But this was not, in his opinion, the true reading of the Act. Some limitation must be placed upon the term "annual voluntary contributions," and the limitation seemed to him to be that above expressed. He could not bring himself to hold otherwise than that the object which prompted the subscribers to pay a guinea or more to the Art Union of London was the hope and expectation of gaining in the legalised lottery what every subscriber had an equal chance of obtaining, namely, a prize and the other material advantages attaching to the subscription. The subscriptions were not gifts made from disinterested motives for the benefit of others so as to be annual voluntary contributions within the meaning of the Act. That being so, the Art Union failed to prove the second requirement, and, in his opinion, the appeal should be dismissed.

THE NINEVEH SCULPTURES.

A FINE series of reproductions from some of the most notable sculptures contained in the Assyrian collection of the British Museum by Mr. Alfred Jarvis has been purchased for the Brighton Museum, to the collection at which they will form a most interesting addition. The series comprises statuettes of Sennacherib, Assurbanipal and his queen; figures of the well-known winged human-headed Lion and Bull, Nimrod's Head, a small lion weight, and the beautiful "Garden Scene." Though the history of the discovery of the monuments of Assyria, and the subsequent transfer from the long-buried palaces of Assyria's mighty kings to the galleries of the National Museum must be more or less familiar, Mr. H. Spencer has utilised the opportunity in the *Sussex Daily Post* to review the story of the excavations.

The bygone history of Nineveh is more or less involved, he says, in obscurity; but the great city was destroyed somewhere about 600 years before Christ. For many hundred years she had stood in all her arrogant splendour, glorying in pomp and power. But at last she fell. The doom foretold by the prophet Zephaniah (ii. 13-15) overtook her; and Layard tells us how the luxury and civilisation of a mighty nation have given place to the wretchedness and ignorance of a few half-barbarous tribes; and how the wealth of temples and riches of great cities have been succeeded by ruins and shapeless heaps of earth. For more than 2,000 years the city lay buried and its site unknown. Tradition pointed to the banks of the Tigris. There, it was supposed, she had stood in proud and solitary

grandeur, and the mounds, which had so often excited the wonder of travellers, were supposed to be her grave.

Mr. Rich, an Englishman, was the first to investigate the origin of these mounds, but with little success, and the few fragments of inscriptions, pottery, bricks, &c., which he collected were after his death placed in the British Museum. In the year 1842 M. Botta, the French Consul at Mosul, began to explore the mound locally known as Kouyunjik. His efforts were practically fruitless until one day a peasant, who happened to be watching the workmen, was considerably amused at the careful manner in which every fragment of brick or pottery was picked out and laid aside. He laughingly remarked that they might be better repaid for their trouble if they would try the mound on which his village was built, for lots of such rubbish had been turned up when the foundations of their houses were being dug. Following this hint, M. Botta shortly transferred his operations to Khorsabad, where he almost immediately discovered the palace of Sargon, King of Assyria. The greater part of the sculptures which he excavated were sent to Paris; a very few reached England. Encouraged by the success of M. Botta, Mr. (now Sir Henry) Layard determined to explore the mound of Nimrod, a step he had long contemplated. Quickly completing his arrangements, he quietly left Constantinople in the autumn of 1845, reaching Mosul some twelve days later. For various reasons it was deemed prudent to conceal the object of this journey. A few days later, having secretly procured some tools, Mr. Layard and Mr. Ross (a British merchant then residing at Mosul), together with a mason engaged at the moment of departure, announced that they were going to hunt wild boars, and floated down the Tigris on a raft, ostentatiously displaying a variety of guns, spears, and other weapons. By sunset the travellers reached the Awai, or dam across the river, and landing, walked to a small hamlet called Naifa, not far from the great mound, and here, in a miserable hovel inhabited by an Arab and his family, they passed the night. Before they rose next morning the Arab, whose services Layard had engaged overnight, had secured the help of a few more men from a neighbouring village, with implements and various things necessary for the work. Early in the morning operations were commenced at a point where a piece of alabaster appeared above the soil. This proved to be one of several slabs, the whole forming a square chamber, with one stone missing at the corner which was supposed to be the entrance.

Many and various were the difficulties with which Layard had to contend before he relinquished, in 1853, the noble task he had undertaken; but that first day's work was destined to be succeeded by the discovery of no fewer than seventy-one halls and chambers, the entrances to which were guarded by gigantic human-headed monsters, and the walls of which were lined with beautifully-sculptured bas-reliefs. Here on these slabs were portrayed, in a strikingly vivid manner, the habits and the customs of this powerful and warlike race; their battles, the sports of their great kings, and the sufferings of the captive tribes of Israel; while piled up in one of the chambers lay the wonderful library—truly noble monuments of the art and learning of a people who flourished 2,500 years ago. Mr. Layard gives a picturesque description of the last evening the disinterred sculptures were permitted to repose in their own land. "We rode," he says, "one calm, cloudless night to look at them for the last time before they forsook their ancient resting-places. The moon was at her full, and as we drew nigh to the edge of the deep wall of earth rising round them, her soft light was creeping over the stern features of the human heads, while the dark shadows still clothed the lion forms. One by one the gigantic limbs emerged from the gloom till the venerable figures stood all unveiled. A few hours more and they were to stand no longer where they had stood unscathed for ages amid the wreck of all man's other works. It seemed almost sacrilege to tear them from their old haunts—to make them a mere wonder-stock to the busy crowds of a new world. They were better suited to the desolation around them. They had guarded the palace in its glory, and they had watched in its tomb over its ruin." But on the day after this they floated down the Tigris, and after various breakages and vexatious delays, they at last found their way over the ocean to the British Museum.

Some of the finest examples of Assyrian sculpture, thus miraculously discovered, are included in the series of reproductions now obtained for the Museum of Brighton, and they should be highly appreciated for their associations, their truthfulness to the originals, and perhaps no less as examples of the delicate English porcelain (parian) in which they are made. The statuette of Sennacherib, who reigned B.C. 681-705, represents him clad in the robes of the dual office of king and high-priest. The drapery is most richly embroidered and fringed, and the long under-robe extends nearly to his feet. Over the shoulders falls a richly-fringed and decorated cape. His arms, which are bare, are encircled by rich bracelets. The king wears the tiara, so commonly represented on the monuments, and carries in his hand the sacred bow of office. This bow,

which was handed down from king to king, was the gift of the goddess Ishtar, or Ashtaroth, and the possession of it was supposed to insure victory. The prophet Isaiah records some of the chief events of the reign of this great and terrible king. His invasion of Judah; the mysterious destruction of the Assyrian army before Jerusalem; and his tragic death, while praying in the temple, at the hands of his two elder sons, who were jealous of the favour shown to their younger brother, Esarhaddon, but who nevertheless succeeded to his father's throne. The labours of Assyriologists enable us to recognise in the warlike and yet luxurious monarch, Assurbanipal, the Sardanapalus of Ctesias and Byron.

In the statuette we see the king clothed in a close-fitting robe, the groundwork of which is richly spotted with a handsome lozenge pattern, the lower part being decorated with two rows of braiding and a rich tasselled fringe. Over the right shoulder and crossing the breast is a broad belt. The waist is bound by a wide band of cloth, over which is a narrow girdle of richly-worked metal. The breast and short sleeves of this robe are most elaborately treated. On the arms are a pair of gold bracelets. The king wears boots of the Median style; leather greaves reach nearly to the knee, bound with thongs of that material. In the left hand he carries a sword. Assurbanipal succeeded his father, Esarhaddon, about B.C. 668; under him Assyria reached the culminating point of her greatness. He reconquered Egypt, invaded Asia Minor, and received tribute from Gyges, king of Lydia; subjugated most of Armenia, completely conquered Susiana and attached it as a province to Babylon, and reduced many outlying tribes of Arabs. He built the most magnificent of all the Assyrian palaces, patronised music and the arts, and established the Royal Library of Nineveh. The figure of the queen of Sardanapalus is a careful reproduction in the round of the figure represented on a bas-relief. Her majesty wears long garments of a less ornate character than those of the king, and in her right hand holds a wine cup. Assurbanipal had many wives, as he made it the custom to marry the daughters of conquered kings, and his large harem was no doubt the cause of the numerous conspiracies which upon his death broke out among rival princes. In the "Garden Scene" we have a representation of one of the gardens which, in all the Assyrian palaces, were attached to the harem apartments. Here, reclining upon a couch, we see Assurbanipal feasting with his queen, who is seated opposite him in a high chair. In the right hand of each is a shallow drinking-cup, which they raise to their lips simultaneously, as if they were pledging one another. Attendants are carrying in viands upon trays, some of which are already placed on the table; a band of musicians is in attendance, and in the trees the birds are singing, overhead a vine hangs its festoons and rich clusters. But the tranquillity of the scene is strangely marred by a ghastly head which hangs on the branch of one of the trees—the head of the brave Teumman, the defeated king of Elam.

The miniature copies of the winged human-headed lion and bull place before us the winged colossi, known as *shediz*, or spirit-guardians, which were placed at the doorways to protect "the goings out and coming in of the king." The winged bull was sacred to the god Anu, the God of Heaven, while the lion was the emblem of Nergal, the god of War and Death, in his character of the Great Eater (Irkalla). Compare Judges xiv. 14, "Out of the eater came forth meat." The winged figures were really a species of cherubim guarding the royal presence, and their appearance agrees with that of the cherubim of Ezekiel's visions. They symbolise generally divine protecting and guardian power, combining the physical force of the lion or bull with the intelligence of man, as represented by the human head, while the eagle's wings may be taken as emblems of ubiquity. The model of the lion weight represents one of the pretty bronze weights obtained by Layard from the south-west palace at Nimrod. On the back is inscribed in Assyrian the name of Sennacherib (B.C. 702), and on the side a Phœnician inscription which reads, "3 Mana of the Country." This weight forms an interesting monument of the commercial contact between Assyria and Phœnicia. In "Nimrod's Head" we have a reproduction of the head of one of those monsters who guarded the portals of the palaces of the kings of nations. When the head of one of these monsters was first unearthed the Arabs were filled with consternation, and, mounting their horses, rode off at top speed to meet Mr. Layard. "Hasten, O Beg," exclaimed one of them; "hasten to the diggers, for they have found Nimrod himself! Wallah! it is wonderful, but it is true; we have seen him with our eyes. There is no god but God," and, joining in this pious exclamation, they galloped off in the direction of their tents. It will be seen, therefore, that for many reasons, and from various points of view, there is reason for congratulation upon this most recent accession to the treasures of the Brighton Museum.

THE LATE SIR H. LAYARD.

THERE will be regret in other countries beside England at the death, after a long illness, of Sir Henry Layard, the discoverer of Nineveh.

Austen Henry Layard, says the *Times*, was of a very mixed nationality. The circumstances of his birth were probably unique. He was an Englishman on his father's side, a Spaniard on his mother's, a Parisian by birth and an Italian by education. When he first came before a British constituency this combination of nationalities threatened seriously to prejudice him, until he turned the electors in his favour by wittily asking them whether if a man were born in a stable they would call him a horse. Sir Henry's grandfather was Dr. Layard, Dean of Bristol, and his father was Mr. Henry P. J. Layard, who was in the Ceylon Civil Service and who married a Spanish lady. The great archaeologist was born in Paris on March 5, 1817. His youth was spent mainly in Italy, where he also received his education. In 1833 he came to London with the intention of studying for the Bar, but as this sedentary profession had slight attractions for him, and as he had inherited a passion for travel, in 1839 he set out with a friend on a course of exploration through the East. Visiting first various points in Northern Europe, he next proceeded through Albania and Roumelia to Constantinople. He subsequently travelled through various parts of Asia, learned the Arabic and Persian languages, and spent nearly two years among the wild tribes of the Bakhtiari.

There is little doubt that his enthusiasm was fired by the discoveries of Champollion and Wilkinson in Egypt, the researches of Burckhardt and Lane in Arabia, and those of other discoverers in adjacent countries. Resolving in his wanderings to explore specially those spots believed to have been the sites of ancient cities, he found himself ultimately at Mosul, near the Mound of Nimroud, where he was impelled with an irresistible desire to examine carefully the place to which history and tradition pointed as the "birthplace of the Wisdom of the West." M. Botta was already carrying out excavations at the cost of the French Government, and he had found a considerable number of curious marbles. Layard earnestly longed for the opportunity of making similar discoveries, and, returning to Constantinople, he expounded his views before "the great Eltchi," Sir Stratford Canning, who generously offered to share the cost of excavations. This was in 1845. In the autumn he set off for Birs Nimroud, and there he began his labours on a spot hitherto undisturbed. He was ultimately rewarded by exhuming some of the numerous wonderful specimens of Assyrian art which now enrich the British Museum. The discovery and the character of these monuments Layard graphically described in his first important work, "Nineveh and its Remains," published in 1848-49. Yet for a time the British Government had no thanks or encouragement for him. Writing in 1848, while on a visit to Cheltenham, Layard said:—"It is to be regretted that proper steps have not been taken for the transport to England of the sculptures discovered at Nineveh. Those which have already reached this country, and, it is to be feared, those which are on their way, have consequently suffered unnecessary injury. The Great Winged Bull and Lion, which I had hoped would have speedily formed an important portion of the national collection, are still lying at Busrah, and there is little prospect at present of their being brought to this country. Surely British ingenuity and resources cannot, as is pretended, be unable to remove objects which have already, with very inadequate means, been transported nearly a thousand miles. The cases containing the small objects recently deposited in the British Museum were not only opened without authority at Bombay, but their contents exhibited without proper precautions to the public. It is remarkable that several of the most valuable (indeed, the most valuable) specimens are missing; and the whole collection was so carelessly repacked that it has sustained very material injury. Were these Assyrian relics, however valuable, such as could be again obtained, either by ingenuity or labour, their loss might not perhaps be so seriously lamented; but if once destroyed they can never be restored; and it must be remembered that they are almost the only remains of a great city and of a great nation." But while the British authorities were slow in manifesting their gratitude to the explorer, the British public and the press were cordial in their recognition of his splendid services. The narrative of his discoveries became the book of the day, and the engrossing topic of conversation in almost all circles, and it was translated into several languages. It was followed by a second work, "Nineveh and Babylon" (1851), of which an abridgment was published some years later. In 1853 Layard published his further important work, "Discoveries in the Ruins of Nineveh and Babylon; with Travels in Armenia, Kurdistan and the Desert." This was the result of a second expedition undertaken for the Trustees of the British Museum. It was dedicated to Lord Granville "as a grateful acknowledgment of many acts of personal friendship."

Layard unearthed the remains of four distinct palatial

The Society of Engineers on Tuesday, the 10th inst., paid a visit to the Royal Small Arms Factory at Enfield Lock.

edifices at Nineveh and Babylon. The most remarkable discoveries were made in the north-west palace, supposed to have been built by Sardanapalus. The walls had been lined with large slabs of gypsum or alabaster covered with bas-reliefs and cuneiform inscriptions. Many of these were sent to England, together with gigantic winged human-headed bulls and lions and eagle-headed deities. They were placed in the British Museum, of which they have since remained one of the chief attractions. A Nineveh Court was likewise erected in the Crystal Palace, for which the explorer wrote a guide. But while Layard had thus rendered invaluable service as a discoverer, he did not feel competent to take upon himself the task of interpreting the inscriptions he had unearthed. The work of elucidation was left to experts like Oppert, Rawlinson, Norris and Hinckes. As the value of the Assyrian specimens began to be known, the House of Commons voted a sum of 3,000*l.*, which was applied by the trustees of the British Museum in furtherance of Layard's second exploration, referred to above.

THE SHAMROCK: ITS HISTORY.*

WHAT plant is the best entitled to rank as the genuine shamrock of Ireland? Such an inquiry might be considered superfluous, for on this, if any subject, the people of this island, of every class, would be expected to prove unanimous, and to decide such a matter beyond doubt or cavil, settling the recognition of the special botanical product in question with absolute certainty. Unfortunately no such happy consensus of opinion exists, and even the truth of the well-known legendary history of the shamrock is more than problematic.

It is usual in such doubtful subjects to inquire what light can be obtained from printed books or manuscripts. What do we find?

In 1596.—The poet Spenser, who lived amongst us for some years, and ought therefore to possess some value as an authority, says, in his well-known and often-quoted "View of the State of Ireland," when treating of the wars in Munster, that province had been "a most rich and plentiful country, full of corne and cattle," but so reduced from the results of war that the unfortunate "inhabitants if they found a plot of water-cresses or shamrocks they flocked to it as to a feast." Gerarde, in his botanical treatise, defines the plant as the "meadow trifolium, in Ireland called shamrocks." If this be correct, the shamrock, though perhaps not very nutritious, could be eaten in times of scarcity, with appetite.

In 1598.—Fynes Morrison asserts that the "wilde Irish willingly eat the herb shamrock, being of a sharp taste, which they snatch out of the ditches." But our present shamrock has not a sharp taste, and does not select ditches for its growth.

In 1613.—A few years later, Wythers, in his "Abuses Stript and Whipt," holds a similar opinion as to the shamrock being employed for food. He writes:—

And for my cloathing in a mantle go,
And feed on shamroots as the Irish doe.

This agreement of authorities on the edible properties of shamrocks might seem to be corroborated by the observations of Mr. Fortune, related in his "Wanderings in China," in which he states that "the large trefoil leaves in the district he visited are picked and used as a vegetable by the natives."

So much for the use of shamrocks for food. Relating more strictly to its botanical relations, in the year 1699, near two hundred years ago, Edward Llwyd, writing to Tancred Robinson, after paying a visit to our shores, settled to his own satisfaction that the genuine "shamrug was our common clover." (See "Phil. Trans.," No. 335.)

A few years later, in 1726, Dr. Caleb Threlkeld, who published the first treatise devoted to the plants of Ireland, his rare and useful "Synopsis Stirpium Hibernicarum," places it on record that the "plant worn in their hats in commemoration of St. Patrick" was the *Trifolium pratense album* (our *Trifolium repens*). This appears to be the earliest recognition of a practice now recognised as a national duty by Irishmen.

Dr. Johannes Keogh, in 1735, printed in Cork his "Botanologia Universalis Hibernica." He states that the proper Irish name for "the white-flowered meadow trefoil is shamrock, and the purple trefoil is seamar leane." He commends both plants for their styptic properties, and is of opinion that, applied externally, they are beneficial against "phlegmons and inflammations." But neither of these botanists recommends the shamrock for human food.

There is another trifoliate plant of different botanical relations, the "wood-sorrel," to which Keogh gives an Irish appellation not very dissimilar to that of the shamrock, namely,

"shamsoge," and for its scientific equivalent, *Trifolium acetosum vulgare*. Some have accepted this as the veritable plant they suppose St. Patrick employed in his religious teaching; and as it is rather pleasant to eat, and still used for flavouring soups, &c., chiefly abroad however, it is even conjectured that the edible shamrock of Spenser and other early writers was sorrel, not trefoil.

Trefoil, however, is, we are assured by medical writers, "dry in the third degree," and as Irishmen have a lingering belief about the plant requiring to be "drowned" on the evening of each successive 17th of March, and employ a trefoil for that purpose, it must be admitted the claims of sorrel have not received much acceptance. When mentioning these ancient ideas, there is a statement ascribed to Pliny, that trefoil leaves stand upright before the approach of a storm, and can foretell its advent some hours before the wind begins to blow.

A learned Irish scholar informs me that jamapó means the summer plant, derived from jamap, "summer," and ó, "young." He also states that jamapóa buime-bet, or the shamrock of the garland of Béal, is recognised as a different plant from the shamrock of Patrick. The leaves are more delicate, of lighter colour, and it grows in shaded woods, about the roots of trees, having a sour taste. If this be so then the latter plant is wood-sorrel.

Still, in deciding this vexed question of the genuine shamrock, we must consider what botanists can adduce. The latest contribution to our knowledge is published by Mr. N. Colgan, in the "Irish Naturalist" (see vol. ii. p. 267). He obtained, by the co-operation of local residents from several counties, specimens gathered about March 17, and certified by them to be the plant employed in their respective districts by the people. These plants were examined critically to determine them, and subsequently grown to confirm the accuracy of the result. Suffice it to say that out of a total of forty-nine duly authenticated plants so treated, twenty-four proved to belong to *Trifolium repens*, twenty-one to *Trifolium minus*, two to *Trifolium pratense*, and two to *Medicago lupulina*, or common medic. Mr. Colgan adds to his own researches previous inquiries made in the same direction by Mr. James Britton, editor of the *Journal of Botany*, and the collective results strengthen the claims of *Trifolium minus* to be the favourite plant selected for a national symbol in the majority of districts in the present day.

The four-leaved shamrock—what about its mystic powers? There are a few old writers who must have known the legend, for Melton, in his "Astrologaster," says:—"If a man walking in the fields finds any four-leaved grass, he shall, in a short while after, find some good thing." Again, Herrick, in his "Hesperides," sings of "lucky four-leaved grass." To the Irish poet Samuel Lover, however, must be ascribed the wide-spread recognition at present of its properties for diffusing universal happiness when gathered in "the fairy dells." Fortunately the leaf is not rare, and its influence can be tested without difficulty.

In seeking to investigate the story popularly believed in Ireland, at least for two or three centuries past, of St. Patrick's alleged employment of some trifoliate leaf to explain the mysterious relations of the Trinity to the native inhabitants of Erin, on the coasts of Wicklow or Wexford, where he is supposed to have landed, I can report nothing but failure. Whether there was one St. Patrick, or possibly two or more, bearing a similar patrician name or rank amongst the number of Ireland's early apostles, certain it is that, having consulted skilled Irish scholars, they informed me that in none of our Irish manuscripts relating to St. Patrick is the legend alluded to. At the utmost it appears to be of Mediæval origin. It is, therefore, with regret and disappointment I am forced to conclude St. Patrick never handled a shamrock during his protracted life to explain any of his teaching.

The shamrock, however, is a national symbol in the same sense that the rose and thistle are the respective emblems of England and Scotland. They respectively make their appearances on the coinages of those countries about the following dates:—

Trefoils occur as mint-marks on the coins of Henry IV., appearing on groats of his "light money." His reign extended from about A.D. 1399 to A.D. 1413.

During Henry VI.'s reign both trefoils and roses assume such prominent and distinctive positions that some of his English coinages are distinguished by the rosettes they bear, and others by the trefoil, usually associated with pine cones.

In Edward IV.'s reign the rose assumes its full development, as in the instance of his rose ryals, and shamrocks are conspicuous upon his Irish crown groats. As we might expect, the rose occupied that prominent position it still retains as a badge distinctive of England in the troublous times of the contests between York and Lancaster.

The occurrence of the thistle upon Scottish coins is of later date. It appears in 1560 on silver coins of Queen Mary.

Upon the copper coins of larger module known as St. Patrick's money, ascribed to the mint established by the

* A paper by Mr. W. Frazer, F.R.C.S.I., M.R.I.A., Hon. F.S.A. (Scot.), Fellow, in the "Journal of the Royal Society of Antiquaries of Ireland."

Nuncio Rinuccini, in Kilkenny, for the use of the Confederate Irish Catholics in the wars of Charles I., we have for the first time St. Patrick with mitre and crozier, represented displaying a trefoil to the assembled people. After a long interval another Irish historic coin occurs, the copper pieces issued by Sarsfield during the siege of Limerick, made by re-striking the brass money of James II. and issuing it for pence and halfpence. This represents a seated figure of Erin holding out the mystic plant.

In the reign of George IV. shamrocks increased remarkably in size, for on his half-crown of 1820 and 1821 each of the three leaflets is represented as large as a Scottish thistle and nearly equal to a full-blown rose. This was possibly the result of His Majesty's intended visit to Ireland which occurred at the later date of 1821; but the effects were visible on his shillings coined in the year 1826, where the disproportion in size is still conspicuous.

I would therefore date the origin of the shamrock legends about the end of the fourteenth century, with which chronology its appearance on Mediæval Irish tombs would fairly agree; for all our earlier tombstones, such as those figured in Petrie's classic work on "Early Christian Inscriptions," are altogether free from its presence. The further development of the idea seems to have progressed during the reigns of Elizabeth, of James I. and Charles I. This assumed Mediæval date also synchronises with the frequent occurrence of shamrock patterns on tiles employed in Irish ecclesiastical edifices. The illustrations of these tiles now published illustrate the variety of patterns and beauty of design they display.

The suggestion has often been made that the shamrock was a plant revered by the pagan Irish, possibly derived from Assyrian or Babylonian worship. Nothing is easier than to construct such theories and the less evidence to support them the more confidently they are advanced. Such investigations are beyond the scope of the present inquiry, which is limited to ascertained facts and historic testimony.

PUBLIC BUILDINGS IN NEW SOUTH WALES.

THE report of the Government architect, Mr. Vernon, states that during the past year the expenditure on public buildings and services, furniture and office expenses (including contingencies) amounted to 319,169*l.* 6*s.* 1*d.* Of that sum 161,844*l.* 13*s.* 6*d.* was paid out of Consolidated Revenue, and 157,324*l.* 12*s.* 7*d.* from Loan Votes. The expenditure has been spread over 674 separate buildings and services, from which it will be seen that a large percentage of the Government property under the charge of this branch has in some form or other received attention, and the amount available has been distributed to the utmost extent.

A large number of buildings, particularly in the country, is suffering from want of systematic repair, and in some few cases they have become almost ruinous, and Mr. Vernon again ventures to press upon the Minister the importance, at the earliest possible moment, of making provisions so that some plan may be arranged which will provide for the external painting at least once every fourth year and internal painting once every seventh year, together with some provisions to make good the ravages of white ant and the general results of climatic influence.

During the year the competitive designs for a lunatic asylum at Rossiville, for which plans were invited in the previous year, were placed before a specially appointed Board, consisting of Dr. Manning, the inspector-general of insane; Mr. Horbury Hunt, president of the New South Wales Institute of Architects, and myself, with Mr. Brindley, building surveyor of this branch, acting as secretary. Forty sets of plans were submitted, and the labours of the Board, in arriving at a conclusion and recommendation, extended over some three weeks of continuous work.

The Minister adopted the recommendation of the Board, and the following awards were publicly made:—1. Messrs. Sulman & Power, premium, 300*l.* 2. Mr. John Kirkpatrick, 200*l.* 3. Mr. G. D. Payne, 125*l.* 4. Mr. J. J. Clark, 75*l.* 5. Messrs. Weitzel & Mackinnon, premium, 50*l.* During the year the Minister, on obtaining Parliamentary sanction, proceeded with the completion of the Sydney Hospital in Macquarie Street, appointing Mr. John Kirkpatrick as architect, who subsequently contracted with Mr. A. M. Allan for the execution of the works for the sum of 64,911*l.*

The office staff at the close of 1892 was comprised as follows:—The Government architect, principal assistant architect, four assistant architects, one building surveyor, six district inspectors, seventeen draughtsmen, nineteen clerks of works, chief clerk, accountant, correspondence and record clerk, eight clerks, three clerks to assistant architects, and one shorthand writer.

The total office expenses, including salaries, contingencies,

travelling expenses, &c., amount to 21,911*l.* (of which the sum of 2,815*l.* is provided for in the clerical division of the Public Works establishment).

The following shows the percentage cost of the various services, based on the total expenditure of 300,587*l.* 6*s.* 1*d.*:—Professional, 2·71 per cent.; superintendence by clerks of works, 2·52 per cent.; clerical, 1·10 per cent.; contingencies, travelling, &c., 1·02 per cent.; total, 7·35 per cent.

This at a first glance compares unfavourably with that of 1891, which stands at 6·15; but it may be pointed out that during the year a large amount of departmental work, abortive plans, preliminary sketches and reporting on general repairs, &c., were undertaken far in excess of any previous year, which, if carefully valued and charged for, would reduce the percentage to an amount at least equal to that of 1891.

TESSERÆ.

Roman Ornament.

RAFFLED leaves form a favourite enrichment in the architecture of the Romans; indeed, these are hardly less frequent in their works than the honeysuckle is in those of the Greeks. Mouldings were enriched with them, and a raffled leaf masks the angles of carved cymas and ovals in the former, as a honeysuckle does in the latter. Nevertheless, the honeysuckle and lotus are both found in Roman enrichments, particularly the latter, and perhaps even more than in Greek. It is not uncommon to find examples of Roman architecture completely overdone with ornament—every moulding carved and every straight surface, whether vertical or horizontal, sculptured with foliage or with historical or characteristic subjects in relief. This fault is most obvious in those works which exhibit similar bad taste in the general composition. The triumphal arch of Septimius Severus, the little arch of the goldsmiths, and the half-buried ruin called the Temple of Pallas in the Forum of Nerva at Rome are egregious specimens. The entablature of the Arch of Titus, too, is overloaded with ornament. Frieze enrichments, consisting of foliage composed with animals and a variety of other things are very common in Roman architecture. Many specimens indeed are not found in existing structures, but there are numerous fragments of entablatures of destroyed edifices which exhibit them in great variety. Their general character is exuberance and a tendency to frittering from the variety and incoherence of form in their composition, but their effect can only fairly be judged of when seen in appropriate situations. One existing example of an enriched frieze of the kind referred to, that of the Temple of Antoninus and Faustina, speaks strongly in its favour, for nothing can surpass its efficiency and simple beauty, but it must, moreover, be confessed that when examined in detail, the enrichment is less exuberant and is composed of fewer parts than most others of the species to which that example belongs. Architectural ornament, however, is not confined to purely architectural works. We find many beautiful specimens of it on the vases and candelabra which decorated the baths and mansions of the ancient Romans, and whose elegance of form rivals even the beauty and delicacy of their enrichments. Whether these should be referred or not to the Romans is doubtful, for it has been already intimated from the style of many of them, both in outline and ornament which appertain more to the Greek, that they are the productions of Grecian artists, but indeed they belong exactly to neither, for they frequently possess the beauties and sometimes exhibit the defects of both. There are existing works, too, clearly of Roman origin, and far superior in every respect to the things just quoted. These are for the most part cenotaphial monuments, sarcophagi and altars whose composition, details and enrichments are gross and inelegant when compared with the objects alluded to. The difference may arise merely from the inferiority of the artists of the one to those of the other, and not from the difference of their schools, but the prevalence of Greek taste in the superior productions is not the less striking because it was acquired by education, while it is wanting in the inferior, whose authors had not been imbued with the spirit and fine feeling of the Greek style.

Girtin's Water-Colours.

Girtin made his drawings, with but few exceptions, on cartridge-paper. He chose this material as his aim was to procure a bold and striking chiaroscuro, with splendour of colour and without attention to detail. Some of his happiest productions display these qualities, united with magnificent effect. Certain of his topographical views are treated with an originality of feeling that cannot fail to captivate the artist and the connoisseur. Many of his works, however, betray a carelessness of execution and an inattention to proportions and to form which requires something of prejudice in favour of originality to tolerate or endure. His mountainous scenery was oftentimes treated with grandeur of effect, obviously assuring us that he had been an attentive observer of those sublime appear-

ances, created by storms and vapours, which occur in those elevated regions. He was one of those daring imitators of nature who ventured to represent a mass of mountains dark and darker still as they receded into the distance, a figure of painting which none but the most poetic mind would presume to introduce in a composition. The flatness and freshness with which he described the valleys, extending to the basis of their surrounding heights, he imitated with a felicity that perhaps has never been exceeded. The distant herds, too, which he introduced grazing on these plains were so near to what we have seen when a gleam of light has penetrated a parting cloud, so many gems glittering on the verdant meads. The artist prepared his drawings on the same principle which had hitherto been confined to painting in oil, namely, laying in the object upon his paper with the local colour, and shadowing the same with the individual tint of its own shadow. Previous to the practice of Turner and Girtin drawings were shadowed first entirely through, whatever their component parts—houses, castles, trees, mountains, foregrounds, middle-grounds and distances all with black or grey, and these objects were afterwards stained or tinted, enriched and finished, as was the custom to colour prints. Girtin's admirers tolerated a defect in his drawings, which proves how much allowance the liberal connoisseur will make for the sake of genius. The paper which he most admired was only to be had of a stationer at Charing Cross; this was cartridge, with slight wire marks, and folded like foolscap or post. It commonly happened that the part which had been folded when put on the stretching-frame would sink into spots in a line entirely across the centre of the sky, so that where the crease had been the colour was so many degrees of a darker blue than the general tone of the sky. This unsightly accident was not only overlooked, but in some instances really admired, inasmuch that it was taken for a sign of originality, and in the transfer of his drawings from one collector to another bore a premium according to that indubitable mark.

Celtic Metalwork.

Among the British Celts, ornament in metalwork is either stamped, chased, cast or applied; certain motives of decoration are characteristic of, if not peculiar to it, which examples would make obvious although it may not be easy to convey much notion of them in words. One is that known as the trumpet pattern, a curved form expanding towards one extremity. It is frequently united to another similar curve, but in a manner that reminds one in some degree of Chinese design rather than that of any other race; this trumpet pattern, of which examples are abundant in what may be called the second or later period of Celtic work, is seen on the massive cast bronze armlets that have been occasionally found in Scotland. The ancient British bronze shield found in the river Witham near Lincoln, and once in the Meyrick collection, exhibits in a very striking manner the employment of this trumpet ornament. Allied to this pattern is another frequent motive; a series of somewhat parabolic curves emanating from a centre, often, but not invariably, three in a group; a peculiar abrupt manner in which these are truncated is especially Celtic; even where grotesque attempts at indicating animal forms are introduced the character of the curved lines remains unchanged. This is seen in the ancient bronze shield above alluded to, where a hog of the most singular proportions is attempted to be delineated, or rather where its outline remains on the shield, the figure having been appliqué and fallen off. Spirals of ornament, but always retaining a peculiarity of curve, are also of common occurrence. On goldsmiths' work from Ashantee such spirals may be seen but without the distinctive feeling in the curve. These spirals are to be distinguished from the discs composed each of a spiral of bronze wire frequent on armillæ of Teutonic origin, the latter being formed somewhat in the shape of the letter S, but the former constructed in a peculiar manner of a double line are rolled inward towards each other. The distinctions may seem minute, but it is the permanency of such peculiarities and their traditional distinctiveness which enable ornamental art to be tracked ethnologically, and which every now and then may repay the student by furnishing some clue to its origin. In a period succeeding or at all events subsequent to the later bronze epoch the Celtic goldsmiths' work attained a perfection of detail and skilful execution that has never been equalled by any other race.

The Architecture of the Hebrews.

Few things have occasioned controversies more amusing from the singularity of some assumptions and the absolute futility of them all than the style and manner in which Solomon's temple was built. Villalpanda, a Spanish Jesuit, appended to a commentary which he wrote on the prophecies of Ezekiel a long dissertation on the first and second temples of Jerusalem, in which he insists that the theory and practice of permanent architecture commenced with the building of that temple by Solomon—that with it "the orders" which, he says, are falsely attributed to the Greeks, came into existence—that, indeed, the design (from a passage in the first book of the

Chronicles), perfect in all its details, was given to David, drawn by the hand of God. He moreover pretends to show that the proportions assigned by Vitruvius to the different orders accord exactly with the descriptions given of the temple of Solomon, and accuses Callimachus of usurping the honour of inventing the Corinthian capital, which could not belong to him, as it was of divine origin, and had been executed in the temple at Jerusalem centuries before he was born. Some learned, and in some respects sensible men, have attempted to support this theory, and others have thought it worth while to controvert it by proving that the architect and the principal workmen were all either Egyptians or Phœnicians, and that consequently the edifice must have been in the Egyptian style. A learned architect of the present day has endeavoured to show that it was in the Greek style, and that its form, proportions and distribution were not dissimilar to those of the Temple of Ceres at Eleusis. As the Phœnicians, who were principally employed by Solomon, themselves built in the Egyptian manner, the probability is great that it was in the Egyptian or Phœnician style as far as the Jewish ceremonial would permit, and certainly the descriptions of its distribution accord better with that of an Egyptian than of a Grecian temple. The pillars of Jachim and Boaz, which are said to have been set up before the temple, correspond exactly in relative situation with the obelisks in temples at Thebes. Clemens of Alexandria, too, gives a description of an Egyptian temple very much like that of the Jewish, and the palm-leaves, roses, fruits and flowers in the latter are very common in existing specimens of the former, whereas in the Greek remains of early date no such things are to be found. Whether the Jews in after times possessed a national style of architecture or not we cannot tell; there is no reason, however, for supposing that they did, for their monotheistic structure at Jerusalem was not repeated in other places as the temples of the heathen divinities were among the Greeks and Romans, by which they might have acquired a peculiar mode of composition and combination. The non-existence of a national Jewish style of architecture tends also to strengthen the theory that architecture did not originate in the disposition and decoration of buildings for domestic purposes, of which the Jews must, when settled, have made as much use as other nations, and a multiplicity of religious edifices, in the construction of which they might have acquired one, was forbidden by their code.

Pictorial Composition.

In commencing a composition it is customary to mark the middle of the space, for the purpose of arranging those points we consider of most importance to the subject, dividing the picture for the regulation of the masses of light and shade, of ascertaining and fixing the horizontal line, &c. This mode of constructing the composition is often suggested from the perspective effect requiring a length of line, thereby obliging us to place the point of sight at one side of the picture; sometimes from the group requiring a large space, which a diagonal line secures, as in the *Elevation of the Cross*, by Rubens, or from the conduct of the light, as in his picture of the *Descent from the Cross*, &c. In compositions conducted on this principle (particularly where the landscape occupies a large portion), many artists carry the lines of the clouds in a contrary direction to counteract the appearance of all the lines running to one point. Thus using the darks of the clouds, &c., to antagonise, as it is termed, may apparently produce a better equipoise, but sacrifices many advantages, for we observe in many of the pictures of Cuypp, Rubens and Teniers, where the figures, landscape and sky are all on the same side of the composition, that a rich and soft effect is produced; the strong light and dark touches of the figures telling with great force against a background with houses, trees, &c., which are prevented from being harsh and cutting by mixing their edges with the clouds or dark blue of the sky. This doubling of the lines gives a picture that rich fulness which we often perceive in a first sketch, from its possessing several outlines. Those who imagine that by thus throwing the whole composition on one side a want of union will be produced, will be convinced of their error by perceiving how small an object restores the balance, since, by its being detached and opposed to the most distant part, it receives a tenfold consequence.

The Three Orders.

There are three principal gradations of proportion in all objects. Thus in nature there are the tall, the short and the mean between the two; the strong, the weak and the mean between the two. So in classical architecture, the same modifications are developed in the æsthetical divisions known as the orders. Strength and robustness are characterised in the Doric, refined and modified as a mean in the Ionic, and attenuated to greater grace and elegance in the Corinthian. The Italian masters, when they classified ancient architecture into five orders, abandoned the philosophy which guided the Greeks in limiting the orders to these three leading expressions of proportion and ornament. There can be only three orders of Classical architecture and no more.

THE JUDGMENT OF MIDAS.

2698, 2700, 2702, 2704, 2706, 2708, 2710, 2712, 2714, 2716, 2718, 2720, 2722, 2724, 2726, 2728, 2730, 2732, 2734, 2736, 2738, 2740, 2742, 2744, 2746, 2748, 2750, 2752, 2754, 2756, 2758, 2760, 2762, 2764, 2766, 2768, 2770, 2772, 2774, 2776, 2778, 2780, 2782, 2784, 2786, 2788, 2790, 2792, 2794, 2796, 2798, 2800, 2802, 2804, 2806, 2808, 2810, 2812, 2814, 2816, 2818, 2820, 2822, 2824, 2826, 2828, 2830, 2832, 2834, 2836, 2838, 2840, 2842, 2844, 2846, 2848, 2850, 2852, 2854, 2856, 2858, 2860, 2862, 2864, 2866, 2868, 2870, 2872, 2874, 2876, 2878, 2880, 2882, 2884, 2886, 2888, 2890, 2892, 2894, 2896, 2898, 2900, 2902, 2904, 2906, 2908, 2910, 2912, 2914, 2916, 2918, 2920, 2922, 2924, 2926, 2928, 2930, 2932, 2934, 2936, 2938, 2940, 2942, 2944, 2946, 2948, 2950, 2952, 2954, 2956, 2958, 2960, 2962, 2964, 2966, 2968, 2970, 2972, 2974, 2976, 2978, 2980, 2982, 2984, 2986, 2988, 2990, 2992, 2994, 2996, 2998, 3000, 3002, 3004, 3006, 3008, 3010, 3012, 3014, 3016, 3018, 3020, 3022, 3024, 3026, 3028, 3030, 3032, 3034, 3036, 3038, 3040, 3042, 3044, 3046, 3048, 3050, 3052, 3054, 3056, 3058, 3060, 3062, 3064, 3066, 3068, 3070, 3072, 3074, 3076, 3078, 3080, 3082, 3084, 3086, 3088, 3090, 3092, 3094, 3096, 3098, 3100, 3102, 3104, 3106, 3108, 3110, 3112, 3114, 3116, 3118, 3120, 3122, 3124, 3126, 3128, 3130, 3132, 3134, 3136, 3138, 3140, 3142, 3144, 3146, 3148, 3150, 3152, 3154, 3156, 3158, 3160, 3162, 3164, 3166, 3168, 3170, 3172, 3174, 3176, 3178, 3180, 3182, 3184, 3186, 3188, 3190, 3192, 3194, 3196, 3198, 3200, 3202, 3204, 3206, 3208, 3210, 3212, 3214, 3216, 3218, 3220, 3222, 3224, 3226, 3228, 3230, 3232, 3234, 3236, 3238, 3240, 3242, 3244, 3246, 3248, 3250, 3252, 3254, 3256, 3258, 3260, 3262, 3264, 3266, 3268, 3270, 3272, 3274, 3276, 3278, 3280, 3282, 3284, 3286, 3288, 3290, 3292, 3294, 3296, 3298, 3300, 3302, 3304, 3306, 3308, 3310, 3312, 3314, 3316, 3318, 3320, 3322, 3324, 3326, 3328, 3330, 3332, 3334, 3336, 3338, 3340, 3342, 3344, 3346, 3348, 3350, 3352, 3354, 3356, 3358, 3360, 3362, 3364, 3366, 3368, 3370, 3372, 3374, 3376, 3378, 3380, 3382, 3384, 3386, 3388, 3390, 3392, 3394, 3396, 3398, 3400, 3402, 3404, 3406, 3408, 3410, 3412, 3414, 3416, 3418, 3420, 3422, 3424, 3426, 3428, 3430, 3432, 3434, 3436, 3438, 3440, 3442, 3444, 3446, 3448, 3450, 3452, 3454, 3456, 3458, 3460, 3462, 3464, 3466, 3468, 3470, 3472, 3474, 3476, 3478, 3480, 3482, 3484, 3486, 3488, 3490, 3492, 3494, 3496, 3498, 3500, 3502, 3504, 3506, 3508, 3510, 3512, 3514, 3516, 3518, 3520, 3522, 3524, 3526, 3528, 3530, 3532, 3534, 3536, 3538, 3540, 3542, 3544, 3546, 3548, 3550, 3552, 3554, 3556, 3558, 3560, 3562, 3564, 3566, 3568, 3570, 3572, 3574, 3576, 3578, 3580, 3582, 3584, 3586, 3588, 3590, 3592, 3594, 3596, 3598, 3600, 3602, 3604, 3606, 3608, 3610, 3612, 3614, 3616, 3618, 3620, 3622, 3624, 3626, 3628, 3630, 3632, 3634, 3636, 3638, 3640, 3642, 3644, 3646, 3648, 3650, 3652, 3654, 3656, 3658, 3660, 3662, 3664, 3666, 3668, 3670, 3672, 3674, 3676, 3678, 3680, 3682, 3684, 3686, 3688, 3690, 3692, 3694, 3696, 3698, 3700, 3702, 3704, 3706, 3708, 3710, 3712, 3714, 3716, 3718, 3720, 3722, 3724, 3726, 3728, 3730, 3732, 3734, 3736, 3738, 3740, 3742, 3744, 3746, 3748, 3750, 3752, 3754, 3756, 3758, 3760, 3762, 3764, 3766, 3768, 3770, 3772, 3774, 3776, 3778, 3780, 3782, 3784, 3786, 3788, 3790, 3792, 3794, 3796, 3798, 3800, 3802, 3804, 3806, 3808, 3810, 3812, 3814, 3816, 3818, 3820, 3822, 3824, 3826, 3828, 3830, 3832, 3834, 3836, 3838, 3840, 3842, 3844, 3846, 3848, 3850, 3852, 3854, 3856, 3858, 3860, 3862, 3864, 3866, 3868, 3870, 3872, 3874, 3876, 3878, 3880, 3882, 3884, 3886, 3888, 3890, 3892, 3894, 3896, 3898, 3900, 3902, 3904, 3906, 3908, 3910, 3912, 3914, 3916, 3918, 3920, 3922, 3924, 3926, 3928, 3930, 3932, 3934, 3936, 3938, 3940, 3942, 3944, 3946, 3948, 3950, 3952, 3954, 3956, 3958, 3960, 3962, 3964, 3966, 3968, 3970, 3972, 3974, 3976, 3978, 3980, 3982, 3984, 3986, 3988, 3990, 3992, 3994, 3996, 3998, 4000, 4002, 4004, 4006, 4008, 4010, 4012, 4014, 4016, 4018, 4020, 4022, 4024, 4026, 4028, 4030, 4032, 4034, 4036, 4038, 4040, 4042, 4044, 4046, 4048, 4050, 4052, 4054, 4056, 4058, 4060, 4062, 4064, 4066, 4068, 4070, 4072, 4074, 4076, 4078, 4080, 4082, 4084, 4086, 4088, 4090, 4092, 4094, 4096, 4098, 4100, 4102, 4104, 4106, 4108, 4110, 4112, 4114, 4116, 4118, 4120, 4122, 4124, 4126, 4128, 4130, 4132, 4134, 4136, 4138, 4140, 4142, 4144, 4146, 4148, 4150, 4152, 4154, 4156, 4158, 4160, 4162, 4164, 4166, 4168, 4170, 4172, 4174, 4176, 4178, 4180, 4182, 4184, 4186, 4188, 4190, 4192, 4194, 4196, 4198, 4200, 4202, 4204, 4206, 4208, 4210, 4212, 4214, 4216, 4218, 4220, 4222, 4224, 4226, 4228, 4230, 4232, 4234, 423

SOCIETY OF ANTIQUARIES.

THE congress of archaeological societies in union with the Society of Antiquaries has just been held in Burlington House, Sir A. Wollaston Franks, K.C.B., F.R.S., president of the Society of Antiquaries, in the chair. Mr. W. H. St. John Hope read the report. The continuation of the archaeological survey of England, and the drawing up of rules for securing a uniform method was discussed. The surveys of Kent, Herts, Cumberland and Westmoreland, and Lancashire north of the Sands, have already been published. The surveys of Herefordshire and the rest of Lancashire have been completed, whilst those of Cornwall, Devon, Durham, Northumberland, Derbyshire, Sussex, Surrey and Berks were reported as in active progress. To these must be added the survey of Essex, which Mr. G. F. Beaumont laid on the table, the map, thickly sprinkled with the symbols adopted for distinguishing different archaeological finds and sites, as well as the accompanying schedules, exciting a good deal of interest and discussion. Mr. Beaumont entered at some little length into the reasons which caused him to differ from most Essex antiquaries in assigning the ancient Roman station of Camulodunum to Chesterford rather than to Colchester. These maps and indexes when completed for England will be invaluable; the symbols used indicate the period (pre-Roman, Roman or post-Roman) of the discovery, and also its nature—whether earthworks, camps, coins, cemeteries, potteries, &c. It is proposed to follow up this series by similar maps and indexes of Mediæval remains. Mr. Ralph Nevill, F.S.A., was asked to issue an appendix to his list of transcribed or published parish registers, which he compiled for the Societies four years ago.

Mr. Ralph Nevill then read the report of a sub-committee on a photographic survey of England by counties, based on what has already been accomplished by the archaeological section of the Birmingham and Midland Institute, and followed up by the Society of Antiquaries of Ireland. The report recommended that each should do its best to secure collections of large permanent photographs of matters of archaeological interest, giving details rather than picturesque effects, with a scale to show the size, strongly mounted, and with full description on the back; that three copies of each photograph should be prepared—one for the county society, one for the British Museum, and one for the Society of Antiquaries; and that these photographs should not be undertaken haphazard, but that districts should be mapped out for amateurs, and that a hundred or a portion of a county should be undertaken at a time. Mr. Nevill urged that Sir J. B. Stone, of Birmingham, should be supported in his endeavour to establish a central photographic society for this purpose, to whom the local archaeological societies should give all the aid in their power. This proposition was carried.

Rev. Dr. Cox, F.S.A., read a paper upon "Popular Archaeological Errors and Fiction." He said that it was the duty of antiquaries, now that archaeology was becoming an exact science, and so valuable a handmaid to historians and art students, not only to be accurate themselves but to correct inaccuracies and errors in others, so that the popular blunders of the day might come to an end. He confined himself almost entirely to mistakes in ecclesiology, but said that other branches of archaeology were equally rich in fictions. The connection between cross-legged effigies and the Crusades was shown to be a mere fond imagination. The so-called "Leper" windows of the parish churches, so often pointed out as constructed for the communicating the host to lepers, was proved to be an absolutely baseless and historically untrue surmise. The idea that whitewash on church walls was a post-Reformation abuse was protested against as entirely contrary to fact. It was noticed that oak in old English days, both in ecclesiastical and domestic work, was usually painted and gilded, and not left bare, and the notion of the symbolism of our Lord on the Cross being denoted by the irregular form and plan of cruciform churches was shown to be baseless. Two historic blunders were also pointed out. A hat preserved at Shaw House, Newbury, has long been described as one worn by Oliver Cromwell, but it has recently been proved to have been made for and used by a woman of the period. Haddon Hall too, according to Dr. Cox, himself a Derbyshire man, must give up its Dorothy Vernon elopement legend, which is now said to date back only to the beginning of this century, and to be contradicted by every known historical and architectural fact. Sir Wollaston Franks gave some

curious instances of popular delusions with regard to the British Museum, such as the idea that there were only three Queen Anne farthings, and that the Museum would give a fortune to possess the third one, being supposed to have already got two. He also stated that visitors often desired to see the arrow with which King Edmund was shot by the Danes near Bury St. Edmunds. Mr. St. John Hope spoke of the grievous wrong still done by able architects in stripping off plaster from old Norman rubble-work, which was never intended to be exposed, instancing what Mr. Pearson, R.A., had recently done in that direction at Canterbury Cathedral.

WELLINGTON MEMORIAL, ST. PAUL'S.

IN the course of a letter to the *Times*, Sir Frederic Leighton says:—On April 12, 1892, you permitted me to take, through the hospitality of your columns, the initiative in an act of justice and reparation to the genius of a great English artist, Alfred Stevens, namely, the removal of the monument to the Duke of Wellington in St. Paul's from the chapel, where it had long loomed almost unseen, to the site which it now enriches and for which it was originally designed. Public opinion was, as I had felt, ripe; response, if slow, was in the end adequate, and the result abundantly rewards and justifies those who have shared in it. But my appeal, it may be remembered, was twofold; the first part of our task is complete, the second lies still before us. The monument has been transferred to its proper position and surroundings; it now awaits completion, and it is in this necessary work that I would ask the co-operation of such of your readers as are careful of a supreme artist's fame. The original design of the sculptor—which may be seen at present by the side of the unfinished monument—shows an equestrian statue of the great Duke occupying the now vacant pedestal which surmounts the whole, and worthily crowning the magnificent conception. Of this statue a rough unfinished model from his hands is in existence, and will, if made accessible, serve as a sufficient guide to the artist who shall be privileged finally to carry out this portion of the cenotaph; that artist should be a man whose genius will carry him worthily through such a task, and whose reverence for the name of Alfred Stevens will insure that close adherence to the leading lines and features of the first design which the public voice would justly demand; such a man, both in his gifts and in his reverence, the Dean and Chapter of St. Paul's have seen in Mr. Alfred Gilbert, R.A., whose selection for so noble a task will command, I cannot doubt, universal approval. It now remains to us to seek the necessary sum wherewith to defray this final expenditure, a sum estimated at 3,000*l*. Towards this sum a trifling amount is already in hand, the result of the appeal I made two years ago, but have of late suffered to lie dormant in order to turn all necessary energy to the now happily completed removal.

EDINBURGH APPLIED SCHOOL OF ART.

THE Board of Manufactures has just been presented with an interesting series of eighteen statuettes, being casts of figures that adorned a famous tomb in the cathedral of Dijon, by Mr. J. R. Findlay, for the use of the above school.

This town was the ancient capital of Burgundy; its cathedral was rebuilt in the thirteenth century, and the tomb in question was that of Philip the Bold, who was Duke of Burgundy, 1342-1404. This memorial was executed in the end of the fourteenth century by a Dutch artist called Claus Slater, in black and white marble, relieved with painting and gilding. There was a recumbent figure of the Duke, watched by two angels with outstretched wings, who held his helmet; and round the sides of the tomb ran a series of Gothic arcades filled with forty alabaster statuettes of mourning ecclesiastics, mostly monks, probably Cistercians who had an abbey in the town. The tomb originally stood in the Chartreuse of Dijon, which was founded by Philip. On the suppression of the Chartreuse the tomb was removed to the cathedral, but in 1793 it fell under the ban of the Council of the Commune, and was ordered to be destroyed. The statuettes at that time were carried off and dispersed among the houses of the town, where they did duty as mantelpiece ornaments, &c. After the restoration of peace, the tomb, which was not irreparably injured, was removed to the Dijon Museum, and the statuettes, gathered from lumber-rooms and private cabinets and houses, were again restored to their original niches. It is eighteen casts of the best of these figures which Mr. Findlay has secured and presented to the Board of Manufactures. They stood about 18 inches in height, and are notable for their life-like expression and the varied and picturesque arrangement of the monkish robe and cowl. As examples of what can be done in the way of arranging simple draperies in diverse and graceful folds, the statuettes are worthy of study by the students of the School of Applied Art. General Sir Murdoch Smith has secured casts of four statuettes of the same series for the Museum of Science and Art.

THE TRUE PRINCIPLES OF POINTED OR CHRISTIAN ARCHITECTURE.

By A. WELBY PUGIN.

(Continued from page 12.)

I COME now to speak, in the fourth place, of mouldings, on the judicious form and disposition of which a very considerable part of the effect of the building depends. Mouldings are the enrichment of splays of doorways, windows, arches and piers, of base and string-courses, of weatherings and copings, and they are introduced solely on the principle of decorating the useful.

I will first point out the necessity of these splays and weatherings, and then proceed to consider the form and application of mouldings to them.

to all; the arch mould over them is consequently splayed. This form of pier and arch mould is therefore necessary for both piers and arches.

Great increase of solidity and strength is gained by projections at the base of a building as sets-off; but were these projections left flat at top instead of being bevelled off, they would become lodgments for water.

The splayed or bevelled form is therefore necessary for base moulds. Strings and copings, the very intention of which is to throw off water, must be sloped for the same reason.

It will be readily seen that without a splay a considerable portion of light would be excluded, and that this form of jamb is necessary to the use and intention of a window.

In a doorway the convenience of splayed sides must be evident for ordinary ingress and egress. This form of jamb is therefore necessary to the use and intention of a doorway.

The advantage of piers splayed, or placed diagonally over square ones both for elegance and convenience, must be evident

The use of the splayed form being now demonstrated, I will proceed to consider the mouldings used to enrich it. All mouldings should be designed on the principle of light, shadow, and half tint; and the section of a moulding should be of such a form as to produce various and pleasing gradations of light and shadow. Monotony should be carefully avoided, also all cutting shadows near the outer edge, which have a meagre effect. The original splayed form should never be lost sight of

in the sinkings of the mould, which ought not to be so extravagantly deep as to produce both a real and apparent weakness in the jamb.

All the mouldings of jamb are invariably sunk from the face of the work. A projecting mould in such a situation would be a useless excrescence, and contrary to the principles of Pointed architecture, which do not admit of any unnecessary members. A hood mould projects immediately above the springing of the arch to receive the water running down the wall over the window, and convey it off on either side. This projection answers a purpose, and therefore is not only allowable but indispensable in the Pointed style; but a projection down the

the springing of arches is to receive the different moulds of jamb and arch, which could not be successfully united by any better means than foliated and moulded projections. Hence, in the later Pointed continental churches, where the same moulds run up the jambs and round the arches without interruption, caps are entirely omitted; and the same thing is observable, under similar circumstances, in the nave of Crowland Abbey, Lincolnshire.

Modern and Weak Corbel Mould.

The next class of mouldings I will notice are those belonging to base moulds, weatherings and strings. I have shown above that the bevelled form is necessary for these projections; but when the weathering is of any depth it is evident that the

Examples of Ancient Jamb Moulds.

Ancient Examples of Base Moulds and Weatherings.

Ancient Profiles of Corbel Moulds.

sides of jamb, where it would be utterly useless, is never found among the monuments of antiquity.

The mouldings round an arch are generally more subdivided than those of the jamb. This is carrying out the same principle that may be observed in vegetation, where the solid trunk spreads and divides as it rises upwards. The use of caps at

inclined plane cut by the horizontal joints of masonry will produce what are technically called feather-edged joints, at A A A, which would be easily broken by the action of frost,

and the joints themselves would be penetrated by water. To obviate this, all the varied and beautiful moulds of weatherings have been introduced, by the form of which the stones are strengthened at the joints, and they are protected from the action of water by the overhanging mould throwing it off to the next bevel.

These observations will apply equally to string-courses and copings.

Another important consideration relative to mouldings, and by which their profile should in a great measure be regulated,

Slope of Weatherings.

is the position in which they are placed with relation to the eye of the spectator. The slope of weatherings themselves is determined by this principle, the pitch increasing with the height that they are placed from the ground. Were this not attended to, the upper water-table would be lost to a spectator, unless he was at a considerable distance from the building.

In corbel moulds the profile should be so formed as to gain projection with strength, avoiding deep hollows and unnecessary nosings.

Flying Buttresses.

The apparent width of a string-course placed above the eye depends almost as much on the top bevel as on its actual width, for string-courses of equal width, with different bevels, will vary considerably to the eye.

Every moulding in a Pointed building must be designed and shaped on these consistent principles. The severity of Christian architecture requires a reasonable purpose for the introduction of the smallest detail, and daily experience proves that those who attempt this glorious style without any fixed ideas of its unalterable rules are certain to end in miserable failures.

Another most important, but now most neglected, part of masonry is the jointing of the stones. All bond and solidity is frequently sacrificed for what is called a neat joint by setting one stone on end to form a jamb (page 29, fig. A), when the same space in good old constructions would have been occupied by five or six stones tailing into the wall, and lying in their

English Spire.

natural bed (fig. B); a point which should be most strictly attended to.

Or, if the jambs are built in courses, they are made as uniform as possible, like rustics (fig. C). By this means the effect

Fig IV.
Detached and Canopied Figures.

of the window is spoiled; the eye, owing to the regularity of these projections, is carried from the line of jamb to them, while in the old masonry (fig. D) the irregular outline of the stores does not interfere with the mouldings of the window.

Another point to be remarked in the ancient masonry is the smallness of the stones employed; now, independently of this

Masonry Construction.

being the strongest mode of construction, it adds considerably to the effect of the building by increasing its apparent scale. Large stones destroy proportion, and to illustrate this I have given two representations of the same piece of architecture differently jointed (figs. E, F).

Tracery Joints.

Not only are the stones which are used in the ancient buildings exceedingly small, but they are also very irregular in size, and for the same reason as I have before mentioned, that

the jointing might not appear a regular feature, and by its lines interfere with those of the building.

In the early buildings the work was carried up in regular beds; there were as many joints in a detached pillar as in the wall, and equal space was occupied by the mortar in every part of the building. The joints of stone tracery should always be cut to the centre of the curve where they fall, and if the joint crosses three or four different curves its bed should vary with those curves, and without this is rigidly adhered to in the construction of stone tracery the work must be devoid of the necessary strength. Any of the great circular or mullioned windows of the ancient cathedrals will fully illustrate this principle.

Images in these northern countries were, with some very few exceptions, placed in niches under canopies. This is really necessary to preserve the sculpture from the injuries of weather, and it is much more consistent than leaving the venerable image of a saintly or royal personage exposed to all the pelting of the pitiless storm. Detached images surmounting buildings are characteristic of southern and Italian architecture, and are much better suited to the climate of Milan than that of England (page 28, fig. 4).

Having now, I trust, successfully shown that the ornamental parts of Pointed stone buildings are merely the decoration of their essential construction, and that the formations of mouldings and details are regulated by practical utility, I will endeavour to illustrate the same principles in ancient metal and woodwork.

(To be continued.)

ARCHÆOLOGY AND HISTORY OF THE SCILLY ISLES.

AN interesting article on the Isles of Scilly appears in the *Glasgow Herald*, by Mr. J. M. Mackinlay. He writes:—

The Isles of Scilly were known to the Phœnicians and the Romans. By the Greeks they were called Cassiterides or Tin Islands; but the name was probably applied to part of the Cornish mainland as well, for there is no reason to believe that much tin was ever got in Scilly. In the beginning of the tenth century the islands were annexed, along with the rest of Cornwall, to Saxon England by Alfred's grandson, Athelstan. No one when on a tour in the west of Cornwall should omit, if possible, to visit Scilly. The group comprises thirty-six islands, besides about one hundred islets and ledges of rock, and lies about 27 miles W.S.W. of Land's End and 40 S.W. of Penzance, that port forming their link with the rest of the world. From Land's End the islands may be seen on a clear day. During the fishing season steamers ply to and from Penzance six days a week. At other times the communication, though regular, is less frequent. The crossing is an interesting one if the absence of *mal-de-mer* can be secured. At starting the noble rock-fortress of St. Michael's Mount can be seen within the curve of Mount's Bay. Newlyn, a western suburb of Penzance, is soon passed, and then comes Mousehole, where died, in 1788, Dolly Pentreath, aged 102, famous as the last to use the ancient Cornish speech. Various headlands are successively passed, closing with Land's End, and soon the Isles are seen far off, like clouds on the sea. Hugh Town, on St. Mary's, is the goal of our voyage, and is reached in three hours and a half or so after leaving Penzance. The town has a population of about one thousand. It consists mainly of a long winding street of two-storeyed houses, with an expansion at the east end, where there is a small public garden with seats. The town is built on a narrow isthmus, having St. Mary's Pool with the pier and harbour on the one side and Porth Cressa Bay on the other. Its older and more correct name is Heugh Town—i.e. the town beside the heugh or high ground forming the Garrison Hill. The site of the town is certainly the reverse of a heugh. It is so little raised above the level of the sea that during specially boisterous weather the waves of Porth Cressa Bay have swept across the town and fallen into St. Mary's Pool. On September 26, 1744, they did so, and completely carried off a house and a limekiln, besides doing other damage. In 1755, at the time of the great earthquake at Lisbon, a slight shock was felt on St. Mary's, and the sea suddenly rose several feet. Had the day not been calm and the tide low Hugh Town might have had cause to regret the occurrence. Since then precautions have been taken, and there is now little risk of an inundation. A short but somewhat steep road leads from the town to Garrison Hill, already mentioned. In 1863 the place lost its military character, and though the batteries and a couple of guns remain, the soldiers are gone, their places being taken by coastguardsmen. The buildings also form a meteorological station, and accommodate the Board of Trade life-saving apparatus. Above the entrance still hangs the bell used formerly to ring out the hours from six in the morning till nine at night, a duty now performed by the church clock at the other end of the town. Crowning the hill is Star Castle, poetically known as Stella Mariae. Its walls have eight angular projections, making it resemble a conventional star, hence its name. It was built in the time of Elizabeth. Over its portal are the letters E.R. and the date 1593. There is a walk fully a mile in circuit round the hill, and perhaps from nowhere else can a finer view be had of the various islands of the group. The principal are these:—To the S.W. St. Agnes, to the N.W. Samson, Tresco and Bryher, and to the N.E. St. Martin's. After dusk the gleam of Bishop Lighthouse may be seen seven miles off, while nearer are the lights of St. Agnes and Round Island. St. Mary's is the largest of the group. It is nine miles in circumference, and has a population of about 1,300. Four out of the other five islands are inhabited, and have altogether a population of 700. Till about forty years ago there were some families on Samson, but to provide a better livelihood for them and a better education for the children they were removed to St. Mary's. Who that is familiar with Mr. Walter Besant's novels can fail to remember that Samson was the home of "Armored of Lyonesse?" One of its roofless cottages is pointed out as having been the dwelling of that frank and fearless Scillonian.

To return to St. Mary's, Hugh Town came into importance in the time of Elizabeth. Till then the capital of the island was the now quaint and quiet hamlet of Old Town, a mile off, where once stood the castle of Ennor, granted by Edward I. to Randolph de Blankminster, on condition that he should keep twelve armed men to maintain order, a special desideratum in those days. The islands were granted to him for an annual payment of 300 puffins, or 6s. 8d. There is a legend that in the Middle Ages, when Scilly was under the jurisdiction of the monks of Tavistock, the landing at Old Town Bay was guarded by a chain, and a toll was levied on all who disembarked. The

impost, it is said, was abolished by Richard Plantagenet, who came in disguise, and, when asked for toll, laid the friar dead at his feet. There is little doubt that the place, still called Holy Vale, near the centre of the island, had some ecclesiastical establishment, though no ruins remain to witness to the fact. It is a sheltered spot, such as monks would have chosen, and doubtless vesper and matin chants were once heard there. Now the choristers are the birds that sing among the sycamores. There are several houses in that quiet nook, and in one of them is preserved and prized a handsome old chair said to have been used in 1645 by Prince Charles, afterwards Charles II., when in the island for six weeks before taking refuge in Jersey. Between Hugh Town and Old Town is Peninis Head, the name signifying in Cornish the "head of the island." It is the most southerly point of St. Mary's, and many a billow has broken on its rocky front. There are some curiously-shaped masses of rock on the headland. These have received such fanciful names as "The Monk's Cowl," "The Pulpit Rock," &c. The Pulpit Rock has a projecting ledge above resembling a sounding-board, and from it St. Anthony might have preached to the fishes had his voice been loud enough to be a match for the winds and waves. A cavern called Piper's Hole, with a spring of fresh water in it, is, or was, believed to be connected by a submarine passage with another cave in Tresco bearing the same name. A dog is said to have gone in at the one cave and come out at the other minus almost all its hair. Two immense rocking-stones, styled here, as elsewhere in Cornwall, "Logan stones," were accidentally discovered quite lately on Peninis. The larger of the two is believed to weigh fully 300 tons, and is so delicately poised that one person can put it into motion. A little to the west of Old Town is the graveyard. Aloes and dracænas adorn the place, and in it are buried one hundred out of the three hundred who perished in the wreck of the s.s. *Schiller* on May 7, 1875. There is an old church in the graveyard, but it is now used mainly as a mortuary chapel. The present church in Hugh Town was built in 1836, principally by the late lord-proprietor. The Wesleyans and the Bible Christians—an offshoot from the Wesleyans—have also places of worship. John Wesley visited Hugh Town in 1743, and gave addresses in the street. A mile to the east of Old Town is Porth Hellick Bay, where the body of Sir Cloudesley Shovel was washed ashore in October 1707. His ship, the *Association*, and others of his fleet, were lost when returning from Toulon after the capture of Gibraltar. Two thousand perished in the catastrophe. Sir Cloudesley's body was buried in a bank close to the shore. The notion still prevails that grass will not grow over the spot. The body was afterwards removed to its final resting-place in Westminster Abbey. On the cliff to the south of Porth Hellick Bay are the ruins of an ancient stronghold styled the "Giant's Castle," with traces of ditches and ramparts, and about the same distance to the north of the bay is the "Giant's Chair," a block of stone shaped like a large arm-chair. The islands contain other objects of interest for the student of archæology, such as ancient tumuli, standing stones, &c. On Buzza Hill, near Hugh Town, are three prehistoric sepulchral mounds. Two of these were opened about 1750 by Borlase, the Cornish antiquary. A thunderstorm occurring soon after was superstitiously attributed by the islanders to the disturbance of the graves.

To visit the other islands a steam launch can be hired at St. Mary's, and from its deck ever-changing views of the picturesque rock scenery are to be had. The water is of a lovely hue, varying from a vivid green to a deep blue, and many a white beach covered with beautifully tinted shells tempts one on shore. With regard to St. Agnes, the name, as Mr. Leonard Courtney points out in "A Week in the Isles of Scilly," has really nothing to do with any saint. The name was simply Agnes, Hagenes, or Hagness. The final syllable, being the Norse "ness," a headland, is a relic of Viking occupation. St. Werna seems to have been the patron saint of the island. Close to St. Werna's Cove is her consecrated well, covered by a flat stone. It has for long been filled up with rubbish and is now neglected; but tradition says that many a pin used to be dropped into it with a prayer to the saint to send a rich wreck. At one time, indeed, wrecking was quite common among the islands. On dark and stormy nights cows were driven to the beach with lanterns hung between their horns to lure mariners to destruction by the false lights. The following affords a pleasing contrast:—In 1685 a French vessel struck on the rocks, and instead of pillaging it the St. Agnes people took it in safety to St. Mary's. The money received as salvage was unanimously devoted by the islanders to the erection of a church, as there was then no place of worship on St. Agnes. It was erected beside Priglis Bay, where its successor, built some fifty years ago, still stands. Priglis in Cornish means the "church port" or bay, and one may infer from the name that a church or chapel stood there long before 1685, dedicated probably to the patron saint of the island. Divided from St. Agnes by the narrow channel known as Smith's Sound is Annet, otherwise called Bird Island, a very appropriate name. Multitudes of puffins are to be seen here. They build their nests under

ground, and the surface is so honeycombed that walking requires care to prevent a sprained ankle. The island contains about forty acres, covered with grass and boulders. Sea-pinks abound, and in the summer months the glow of the flowers is seen from afar. On none of the islands are visitors more likely to land than on Tresco, at one time called also St. Nicholas Island. Here beside the ruins of St. Nicholas's Abbey Church stands the lord-proprietor's mansion, surrounded by its famous gardens, where sub-tropical trees and shrubs grow in the open air along with those of a temperate climate. The cultivation of such would be impossible even in Scilly, where the winters are mild, were it not for the high hedges, mainly of the red-flowering *escalonias*, planted to break the force of the wind. Through the courtesy of the proprietor visitors are shown over the gardens. The head-gardener who acts as guide gives much interesting information, and points out the plants brought from such widely-separated lands as South America, Australia, New Zealand and the Cape. The gardens were laid out sixty years ago and extend to ten acres. At the end of one of the alleys is a "cresset" from St. Agnes, formerly in use there as a beacon. It was once filled with blazing coal. In summer it is now filled with a blaze of scarlet geraniums. Just inside the entrance to the gardens is a weird gallery of figure-heads, twenty-six in number, taken mainly from vessels wrecked from time to time on the islands. In another part of the gardens stands in an upright position a stone 4 feet in height, 2 in breadth and $\frac{1}{2}$ a foot in thickness. It has two perforations one above another, sufficiently large to allow the hand to pass through. This stone may have been anciently used for plighting vows, the hands of the engaging parties being thrust through the holes. If this was so the stone belongs to the same class of antiquities as the once revered Stone of Odin at Stennis in Orkney, destroyed eighty years ago, through a hole in which hands were clasped in connection with what was styled the promise of Odin. In his "Guide to the Isles of Scilly," Mr. J. G. Tonkin mentions that the Tresco stone was dug up in 1881 near the ruins of the Abbey Church. The nave of this church was used for burials till the early part of the present century. Troutbeck mentions that in his time, circa 1790, it was held in such veneration that the islanders would not bury their dead anywhere else. A proposal was then made to form a graveyard beside the church in the village fully a mile away; but the villagers objected on the ground that if there were graves beside their houses they might be haunted by the ghosts of the departed. There is now a neatly-kept graveyard at the village church, but, as far as we know, there are no ghosts. Perhaps, like the witches formerly seen on the island, the ghosts have faded into the light of common day. The village where the church stands is called Dolphin Town, a corruption of Godolphin Town, so called after the Godolphin family, who, with the exception of a short break in the seventeenth century, were lessees of the islands from 1539 till 1785, their successor being the Duke of Leeds till 1831. The islands form part of the Duchy of Cornwall. The present lord-proprietor is Colonel Dorien-Smith, who carries on the traditions of his uncle, the late Mr. Augustus Smith, M.P., than whom no one has done more for the prosperity of the Scillonians. The present proprietor, when in residence in Scilly, crosses to Star Castle once a week to attend to the affairs of his tenants. His steward lives in the castle, and there is telephonic communication between it and the mansion-house at the Abbey. Near the mansion-house are two large pools of fresh water, forming a pleasing feature in the scenery of the island. Before leaving Tresco the visitor interested in military antiquities should see the remains of Charles's Castle, on a hill 150 feet high, and Cromwell's Castle at a lower level. The latter, 60 feet in height, was named after the Protector, though not built by him. The islands held out for the King, but after a stout resistance were compelled to submit to the Parliament.

At one time much gain came to the Scillonians through pilotage, and through the less legitimate channel of smuggling. Kelp made from seaweed was largely exported from the islands. Its manufacture is now discontinued. Shipbuilding was quite a prosperous industry on St. Mary's between 1840 and 1864, but it has now reached a vanishing point. From the beginning of May till midsummer the mackerel fishing is at its height, and there is often quite a lively scene on Hugh Town Pier when the fish caught through the nets are auctioned before being transferred to the Penzance steamer. It is a picturesque sight, dear to the heart of an artist, to see the fishing fleet, numbering perhaps a couple of hundred, leaving St. Mary's Pool for their distant fishing-ground, the glory of the setting sun kindling on their sails. Hardly any of the boats belong to Scilly. They are mostly from Penzance, but some come from as far as Lowestoft and Yarmouth. With regard to the commissariat of Scilly, a rhyme says—

Scads and 'tates, scads and 'tates,
Scads and 'tates and conger,
And those who can't eat scads and 'tates—
Oh! they must die of hunger.

This may have been true at one time. It is certainly not so at present. The scad, otherwise known as the horse mackerel, is now little esteemed by the Scillonians. The 'tates, *i.e.* potatoes, are cultivated largely for the London market along with tomatoes and other early vegetables. There are two kinds of conger, the white and the black, the one being caught on sand and the other on rock. According to one etymology the islands derived their names from this fish, *sylla* signifying in Cornish a conger eel, hence Scilly. Another etymology supposes the root to be *scylly*, to separate, pointing to the separation caused by the sinking beneath the sea of the fabled land of Lyonesse between Scilly and the Land's End. As readers of Tennyson know, tradition connected this land with King Arthur. It is at any rate curious that two rocks of the group are called respectively Great and Little Arthur. Scilly, the barren islet giving name to the archipelago, lies to the north-west of the other islands. It may more correctly be described as two islets divided from one another by a narrow channel, through which the sea flows. Troutbeck says "there is reason to believe, from the situation of the shores, that this island, which is now only a bare rock, was formerly joined to the others by low necks of land, and that the adjoining rocks and islets made formerly but one island, which obtained the name of Scilly." He thinks this is proved by the discovery of certain architectural remains beneath the sand, and holds that after the islands became separate each received a name, the chief being called after particular saints; but that Scilly, being uninhabitable, retained its ancient name. It is an interesting fact that at the ebb of spring tides a crossing may still be made dryshod between Tresco and Bryher.

Great changes have occurred in Scilly since the time when there was a whipping-post in the street of Hugh Town, when evil-doers were ducked in the sea at the pier-head, and when felons were left on a rock with bread and water till the tide drowned them. As a matter of fact, there are no felons now in Scilly. There are magistrates and one policeman in Hugh Town, but their work is of the lightest. Stealing some hens was lately the only offence committed during a whole year. Some old customs have disappeared within comparatively recent times. Goose-dancing, *i.e.* masquerading at Christmas, once popular, is now out of fashion. Other recreations at Easter and Whitsuntide have shared the same fate; whilst harvest rejoicings, once an important feature in the social life of the Scillonians, are now reduced to a minimum. One thinks with regret of the disappearance of the Maypole only within the last two or three years, though the May Queen is still crowned with considerable ceremony in the street of Hugh Town.

THE CHETHAM SOCIETY.

THE following is the report submitted at the annual meeting of this Society, held in the audit-room of Chetham's Hospital. The president, Mr. R. C. Christie, occupied the chair:—

During the past year, the fifty-first of the Chetham Society's existence, three volumes have been issued to the members, the two first parts of "The Poems of John Byrom," edited by Dr. Ward, and the second part of the "Chartulary of the Priory of Lancaster," edited by Mr. W. O. Roper. (These three volumes form the second for 1892-93 and the two for 1893-94.) A complete edition of the poems of John Byrom, giving an accurate text, with adequate introductions and notes, was one of the works contemplated on the foundation of the Society, and was an undertaking which Manchester certainly owed to the memory of the single eminent man of letters before the commencement of the present century whose name has been inseparably connected with that of his native city, and whose verses, if they never rise to poetry of the highest order, are characterised by good taste and good sense, accompanied by considerable power of versification, sometimes, indeed, as Dr. Ward remarks, by "a fatal facility" of versification. But Byrom is not only a local worthy. There is probably none among the minor poets of the seventeenth century whose epigrams are so frequently quoted, or who has left a Christmas hymn which is still so popular. In the two volumes which have been already issued Dr. Ward has given for the first time a scholarly and critical edition of the secular poems, with a revised and corrected text, and introductions and notes, clearing up and explaining the numerous local and often obscure allusions which make them in the old editions often so difficult, sometimes impossible, to understand. It is hoped that two more volumes, completing the work and including extracts from the unpublished Commonplace Book of Byrom—some of them of much interest—will be ready during the present year. The second volume of the Chartulary of Lancaster is not of less importance than the first. It throws a flood of light on persons and places in North Lancashire during the thirteenth and fourteenth centuries, and will be found to contain more varied matter of value, especially to Lancashire historians and genealogists, than either the Chartulary of Whalley or that of Furness. The utility of the volume, like that of its

predecessor, is much enhanced by the translation which Mr. Roper has added. A third volume of "Materials for the History of the Church of Lancaster" may shortly be expected. The council are glad to state that Canon Atkinson has undertaken to edit the late Sir Stephen Glynne's "Notes on the Churches of Cheshire." The work proceeds on the same lines as the "Notes on the Churches of Lancashire," and the information it contains with respect to the church buildings, monuments, &c., in Sir Stephen's time and at the present date is certainly as interesting as that furnished in the former volume. The printing of it is completed, and it will be very shortly in the hands of the members. It forms the first volume for 1894-95. The manuscript of Colonel Fishwick's edition of the "Note Book of Thomas Jolly," to which reference was made last year, is now in the printer's hands. The council much regret that Mr. Joseph Hall has found that his engagements will not admit of his editing the "Visitationes exemptæ jurisdictionis Abbatis et Conventus Beatæ Mariæ Virginis de Whalley." The council is most anxious to find some other competent and willing editor, but has not yet succeeded in doing so. The work is one of the highest interest, and of general as well as local importance, not less so, indeed, than the visitations of several other abbeys which have recently been published. During the past year the Society has lost by death seven members, including one of the original founders of the Society, Mr. James Frederick Beever, who for many years took much interest in the work of the Society, and was a regular attendant at its meetings. Although a considerable number of new members have been elected, bringing up the list to 256 names, this is much less than ought to be the case, and the income of the Society is altogether inadequate to its needs. Unless the number of members is increased to 350, it will be impossible for the council to do more than issue two volumes annually. Nor will it be possible to allow of payment being made for transcripts, and the efficiency of the Society will be thus greatly diminished. The following further works are in progress:—"The Minutes of the Bury and Bolton Presbyterian Classes," by Mr. W. A. Shaw, M.A.; "The Life of Humphrey Chetham," by Mr. C. W. Sutton; "The Lancashire Recusants of 1716: being a True List of the Names of those convicted as Popish Recusants at the several Quarter Sessions within the County Palatine of Lancaster," by Mr. Joseph Gillow; "Lancashire and Cheshire Wills, Third Collection," by Mr. J. P. Earwaker, M.A., F.S.A.; "History of the Chapelry of Newton," by the Rev. Ernest F. Letts, M.A.; "History of the Chapelry of Stretford," by Mr. H. T. Crofton.

COLLEGE OF MASONS.

THERE was a meeting of the members of the College of Masons in the hall of the R.I.B.A., 9 Conduit Street, last Monday evening, under the presidency of Sir Arthur Blomfield, to consider the means of continuing the classes of masonry and the College of Masons after the departure of Mr. Lawrence Harvey. After a few words from Sir Arthur Blomfield explaining the object of the meeting, Mr. Harvey gave a short account of the history of the classes of masonry. They were begun in 1886 at the instigation of the Architectural Association. In the following year a classroom was fitted up for them at the Guilds Central Institute, South Kensington, and several practical masons joined, taking their instruction sitting side by side with the architects, a fact which Mr. Harvey considered as very beneficial to both parties, this mixing of the cream of the working classes with young professionals tending to remove prejudices and engender mutual respect. The advantages of the study of masonry were in Mr. Harvey's opinion principally educational; they exercised the mind to conceive forms in space which the eye did not see, and it strengthened the reasoning powers by the application of general principles to the solution of each individual problem. It did for the architect exactly what the study of Greek and Latin did for the man of letters—it strengthened his mind in the very powers which he required.

A letter was received from Mr. Sydney Webb, chairman of the London County Council technical education committee, in which he referred to the technical classes in the various polytechnics, especially at Battersea, as places to obtain the required instruction in case the classes of the Guilds Institute were discontinued.

To this Mr. Johnson, stonemason, answered by saying that he had attended several art schools, and had always found the instruction given there of little practical use. The thing which workmen wanted were classes exactly like those held by Mr. Harvey, and they were to be obtained nowhere else than at the Guilds Institute. All the workmen present supported that view. Mr. Cates, F.R.I.B.A., then said that what must be done is to educate the authorities of the Guilds Institute, the London County Council, and other public bodies, that the science of masonry was not the elementary and unpractical stuff taught

in the various polytechnics, but was a science of a high order, of great educational value to workmen and professionals, and that it was a question of national importance to maintain the classes of masonry. It was then decided to memorialise the Council of the City and Guilds of London Institute to provide another instructor to continue the classes exactly on the same lines as Mr. Harvey had followed.

The Cost of Working an Electric Elevator.

SIR,—Possibly the following figures derived from actual practice of the cost of operation of an electrically driven passenger elevator may be of interest to your readers. The elevator in question was erected under my supervision for Mr. E. D. Stern, at 4 Carlton House Terrace, at the commencement of the present year, the contractors for the work being the Otis Elevator Company. The elevator itself is fitted with a 600 lbs. car, having a rise of 40 feet and designed to work at the rate of 60 feet per minute, and is fitted with all the latest improvements in regard to self-acting safety appliances. It is operated from within by a simple regulating switch, which can be worked quite well by a woman or child, and everything has so far given great satisfaction. The current is supplied from the mains of the local supply company, whose invoice for the last quarter lies before me, the cost of current for working during the last three months amounting to the sum of 9s. 2d., during which time the lift has been in regular use, the number of trips being probably about 400, the cost of an average journey amounting to from one farthing to one-third of a penny, according to load.—Yours truly,

MORGAN J. M. WILLIAMS, M.A., Assoc.M.I.C.E.

GENERAL.

A Grant of 200*l.* has been made to the British School, Athens, from the Royal Bounty Fund.

St. George's Church, Wigan, has been closed for the summer months, owing to alleged unsatisfactory sanitary arrangements surrounding the church.

A Donation of 500*l.* has been received from Mr. George Hanbury for the building fund of the Paddington Green Children's Hospital. About 4,000*l.* is required to complete and open the hospital.

The Death is announced of Professor August Dillmann, of the Berlin University, aged seventy-one. He was well-known in England as the author of the catalogues of the Ethiopian manuscripts in the British Museum and the Bodleian Library.

In Algeria, on the site of the ancient Roman town of Thamugadis, now known as Timgad, portions of a colossal statue, the height of which is estimated to have been no less than nine yards, have been found.

The Royal Society of Antiquaries of Ireland, by invitation of the Cambrian Archaeological Association, will open their annual general meeting at Carnarvon on Monday, the 16th inst., under the presidency of Mr. Thomas Drew, R.H.A., P.R.I.A.I.

The Rubens Picture, *A Boar Hunt*, has just been purchased for the Glasgow Corporation, and placed in the Corporation Galleries. The work is a large one, measuring 4 by 5 feet, and shows a number of men and dogs making an attack upon a wild boar in a forest. The price paid for the work was 1,660*l.*

Sir Joshua Reynolds's Picture, *Lady Betty Deline*, has, it is stated, been purchased for Baron Rothschild for 11,000 guineas.

The Northern Architectural Association have decided to hold their annual excursion at Thirsk, Rievaulx and neighbourhood on Saturday, July 21.

The "Old Glasgow" Exhibition, which has been arranged in the Fine Art Galleries, Sauciehall Street, has been formally opened by Lord Provost Bell, in presence of a large company.

The "Standard" correspondent at St. Petersburg says:—After a long contest, which has lasted nearly three years, the contract for the construction of the new Trinity Bridge over the Neva, in place of the movable wooden one, has been secured by the French company at Batignolles, the most dangerous competitor being also French, M. Eiffel. The bridge is to cost 5,800,000 roubles. No English firms appear to have tendered for this valuable piece of work.

The Architect.

THE WEEK.

THE decision which was given by Mr. Justice MATHEW in *BURT and Others v. BULL and WARD* on Monday should be a warning to all who undertake the management of builders' estates on behalf of creditors. The defendants had been appointed as receivers and managers of the business of BULL, SONS & Co., Limited. Among the works were some unfinished contracts with the London School Board. There was an order for timber of the value of 100*l.* given to the plaintiffs, which was signed by defendants as "receivers and managers." It was contended that the plaintiffs could not be held liable beyond the extent of the funds at their disposal, and, moreover, because they were acting as officers of the court. In his evidence, however, Mr. WARD admitted that he lately applied to the court for permission to dispose of some of the property of the company, on the ground that he was personally liable. His lordship held that the appointment could have been made in a way by which the defendants became exempted, but under the circumstances he believed the defendants had the intention to assume liability, and, therefore, judgment must be given for the plaintiffs. From the decision it would appear as if anyone in the position of plaintiffs were not bound to inquire with whom the dealing takes place.

THE death of Mr. WILLIAM JACKSON, the Leicester architect, on a date that is uncertain, was a lonely ending to a lonely life. For twenty years he lived alone in a house in London Road. He was last seen on the evening of June 28, when he was occupied in his garden. On Wednesday in last week a neighbour, being convinced that something unusual had occurred, climbed to the bedroom window and observed a body lying on the bed in a condition that made identification impossible. The surgeon who made the post-mortem examination could state was that the remains belonged to a man of Mr. JACKSON's physique. There were no signs of violence, but as there was not sufficient evidence of the cause of death, the jury returned an open verdict. Mr. JACKSON was the author of occasional essays, mainly on archaeological subjects. The books found near his bed indicated the current of his thoughts during his last day on earth. They consisted of a Prayer-book, three volumes of SHAKESPEARE, a volume of DANTE, another by MATTHEW ARNOLD, and CARLYLE'S "Sartor Resartus."

It takes a long time to convince people, and especially those who exercise a little brief authority, that parliamentary draughtsmen, when drawing Bills, assume that a spirit of equity will always moderate the universality of application, which, owing to the imperfection of language, seems to be implied in the terms employed in expressing the clauses. There must be, as MACBETH says, "particular addition from the bill that writes them all alike." Of houses, there are, for instance, many varieties, from palaces to dolls' houses, having many properties in common, but it would be carrying logic too far to assert that they must equally submit to the Building Acts. Yet the London County Council appear to have resolved that the regulations are to be enforced in whatever can be designated as a house. They have already experimented with builders' pay-boxes, photographers' show-cases and similar examples of construction. On Monday it was the turn of a specimen of a corrugated iron bungalow that was not used on occasions by a pay-clerk, and did not afford shelter to photographs or anything organic or inorganic. The bungalow rested on the ground at Knightsbridge, but it might as well have been suspended in the air by chains from a crane. When the owners were summoned the magistrate considered the structure to be a specimen of wares, and dismissed the summons. If he could have treated it as an eyesore which was out of place in the vicinity of Hyde Park, his conduct would merit the approval of the neighbourhood. But as regards risk to the Metropolis, the dogs' houses of matting, wicker or wood which are exposed in shops are more dangerous, for they can be easily ignited. The

Council appealed, and the case was heard on Monday before Mr. Justice WILLS and Mr. Justice KENNEDY. Their lordships agreed that there could not be a general rule which comprised all varieties of structures. One expressed the fact by saying that it would be very difficult to formulate a definition; the other said it was impossible to draw a logical line. Both, however, applied the test of use. The corrugated bungalow was not intended for habitation at Knightsbridge; it was merely exhibited with a view to removal whenever a purchaser was attracted, and being part of a manufacturer's stock it could not be treated as a building. The decision has interest, but we hope it will subdue the ardour of the London County Council to apply the Building Acts to purposes which were not contemplated by the legislature.

AN united meeting of the Cambrian Archaeological Association and the Royal Society of Antiquaries of Ireland has been held this week in Carnarvon. Lord PENRHYN, the president of the meeting, in the course of his address spoke upon the advisability of preserving many ancient monuments on the actual site of their historical existence. If Roman milestones were discovered let them be preserved where they were originally placed by those who at the time were the pioneers of the world. They would then form not only a public attraction to the neighbourhoods, but also object lessons of long standing, and draw attention in the minds of beginners to the study of archaeology, in which they were all interested, whereas if they were, as was sometimes done, moved to the museum or to a private dwelling they lost the charm of the story that they could tell to anyone who cared to read it. A relic of that kind standing by the roadside on what was now a lonely mountain path, seldom traversed by ought save sheep and shepherds, would tell of the legions and centurions who tramped by it, and brought civilisation from afar in days when Wales was, save for those Roman roads, a wilderness of woods, mountains and wolves. Lord PENRHYN earnestly invited the Cambrian Society to use its influence in the direction of securing the restoration to their original sites of any such relics of antiquity as they might learn had been buried in what seemed a useless manner.

A MEETING of the School Board of Liverpool was held on Monday to consider the subject of the proposed offices. The Chairman moved that Messrs. BRADBURY, DEACON, KIRBY, and READE be invited to send in plans in competition. An amendment, proposing that all Liverpool architects should be allowed to compete, was lost by one vote. Another amendment, which recommended the postponement of a decision until November, was rejected. The Chairman's motion was subsequently carried by a majority of four votes.

AN exhibition of works by "the Cornish Brotherhoods" will be held in the Castle Museum Galleries, Nottingham, during the autumn. The committee having authorised the art director, Mr. WALLIS, to form a special collection of pictures by painters who form the Brotherhoods of Newlyn and St. Ives, &c., he has been fortunate in obtaining the loan of important pictures from private owners and public collections, as well as from the artists themselves. From Newlyn come works by Mr. STANHOPE FORBES, A.R.A., Mr. FRANK BRAMLEY, A.R.A., Mrs. STANHOPE FORBES, Messrs. CHEVALIER TAYLER, T. C. GOTCH, FRED HALL, WALTER LANGLEY, R.I., &c. The St. Ives school will be exemplified by works from Mr. ADRIAN STOKES, Mrs. ADRIAN STOKES, Messrs. H. H. ROBINSON, W. H. Y. TITCOMB, R.B.A., ARNESBY BROWN, JULIUS OELSON, &c. Mr. NAPIER HEMY and Mr. H. S. TUKE will represent Falmouth, and Mr. ALFRED EAST Lelant.

THE Belgian society of artists known as the "Union des arts décoratifs" has been reorganised in order that more aid may be rendered to various industries. Henceforth membership will not be confined to artists. Manufacturers, writers, lecturers and others who may claim to be associated in some way with industrial art will be eligible for admission into the Union. The principal reason for the change is that the committee hope to organise exhibitions on a grander scale.

INDIVIDUALISM vs. COLLECTIVISM IN ART.*

NOT a few minds will be exercised to discover even a remote connection between a pseudo-historical romance and the subjects to the consideration of which this journal is devoted. That the *motif* of such a work, whether political or economic, can be made to present points of contact with either graphic, plastic, decorative or constructive art will appear a fact hard to understand. It is a difficulty, however, that becomes less apparent after a glance at the contents of the little book by Mr. F. W. HAYES, the artist, and disappears during a careful perusal of some of the chapters, especially those numbered XXVII. and XXXI.

With the main lines of the "story" we have, of course, nothing to do in the way of criticism. It is easier to create Utopias than to plan a convenient cottage. Once let the premises be granted, as has to be done when we wish to enjoy the travels in Lilliput, Brobdingnag and the Flying Island, and the reader will admit that Mr. HAYES has evolved a plausible case to support his supposition that a substitution of national co-operation for the existing competitive commercialism may come upon us at no distant date. So many changes have taken place from time to time, or are now being accomplished within social and political circles, an imaginative man can easily find pleasure in attempting to indicate what will be the remote effects of the new modifications. The adoption of an eight-hour day in Government workshops, and the direct employment of labour by representative bodies, are merely the realisation of projects which a few years ago were regarded as wild and hopeless dreams. The possibilities of yesterday have become the probabilities of to-day. We live amidst a whirling of elements that were once supposed to be stable, and the most prudent, in attempting to interpret the signs of the times, must hesitate to predict in what form they will coalesce on to-morrow. Happily it is not our office to make the attempt. Why we draw attention to "The Great Revolution of 1905" is that several of the results which are postulated in Mr. HAYES's pages as following the immense social and industrial changes affect very closely the status of the fine arts in the dim future, and some, at any rate, of our readers may feel an interest in the prospect which is offered for consideration.

The "Phalanx," it may be mentioned, is a society in which the principle of associated industry is adopted, or one of FOURIER's phalansteries on a scale that is almost beyond the aspirations of the late CÉSAR DALY. It is taken for granted that the principle has obtained such general recognition as to compel the Sovereign to invite the President of the Phalanx to undertake the formation of a Cabinet as the only way to escape in a great crisis. The enthusiasm was unparalleled and one effect of the innovation was the breaking up of party traditions. One of the first Bills introduced provided "that no example of artistic handicraft, and no picture, statue, or work of art of any kind, not already foreign property, should be conveyed out of the country without the permission of a special committee (to be called the Archaeological Council of the Department of Science and Art), that no object of decorative, historical or archaeological interest should be removed from its existing place without the permission of the same Council; and that no tree over twenty years old should be cut down without the permission of a special committee of the Woods and Forests Office." The Bill became an Act in the course of a couple of days, "just in time to prevent a furiously anti-Phalanx public-house owner in Liverpool from selling his collection of 'Rossetti's' to a Chicago hog-millionaire." No less despatch was exercised with other measures, and the constitution was transformed with less friction than commonly arises in the proceedings of the parochial parliaments where the game of legislation has supplanted billiards and whist. One of the results was that "the rush of building operations both of construction and alteration all over the country was without precedent." The success attained by the new power in the State excited the desire of the people for

further interference, and construction committees were accordingly formed who, unlike the buildings-acts and by-laws committees of our time, were able to reform the ways of architects and builders as well as building owners:—

The question of the architectural design of all new structures, whether for public or private use, was one in connection with which the central board exercised for years the most urgent and continuous pressure upon the local authorities. The desire to encourage variety and artistic originality led, in some places, to the somewhat severe regulation that no two residences within sight of each other should present the same design of elevation, while the modern system of laying out the roads of residential property in curved lines was initiated quite early in the new *régime*. The construction committees were called upon to provide everywhere for periodical exhibitions of designs for houses, shops and other required structures, and for schemes and details of decoration in connection with the local schools of art, while it was urged that the freest possible use of the more successful examples should be made by the officials. . . . In a different direction a very valuable service to art and to archaeology was rendered by the strenuous and elaborate care taken to preserve and to rehabilitate all the really old and artistic buildings throughout the country, down to the smallest ancient cottages. Nothing could of course repair the vandalism of the previous years, during which numbers of Jacobean and Elizabethan buildings of great beauty and unimpaired soundness had been ruthlessly destroyed by the speculative builder all over the land. But enough remained to hand down the tradition of the most charming domestic architecture the world has ever seen, and to prove to later generations that in past centuries the constructive art in Great Britain had reached a point of artistic excellence and of structural fitness which our descendants will find a difficulty in approaching and can scarcely hope to surpass.

As Mr. HAYES is a painter, he does not forget the advantages which his own art is supposed to have gained from the ameliorated condition which followed the acceptance of the principle that collectivism was the natural law of the world. A National Council of Arts was formed, consisting of forty members, to grant diplomas which "relieved the holder from the obligation to industrial service, and entitled him to full credit allowance, on condition that the normal hours of work should be devoted to the following of his avocation for the exclusive benefit of the State." We are to suppose that the change worked wonders:—

A stimulus, hitherto unknown and impossible, was afforded to the development of individual aptitude and genius the moment the destructive coercion of market demand, fads of fashion and dealers' insistence on mere manufactures, no longer compelled men to paint not what they wished but what they could sell. Artists could now abandon the production of toy pictures, mere knickknacks of art and adjuncts to upholstery, and devote themselves to works of gallery dimensions if their qualifications suggested such a course. Originality, hitherto systematically stamped out by the dealers as being confusing to their customers (who could only understand what they were accustomed to), now for the first time had full play. The opportunity for publicity, hitherto becoming every year more and more difficult, if not impossible, to those outside the ruling *cliques* of exhibitions, was now open to all with absolute equality. The fame usually so dear to all engaged in the practice of art was brought within the reach of everyone who could legitimately aspire to it.

The indirect results of the emancipation of art from individualist trammels, immense as they eventually became, can only be briefly touched on here. One of the most conspicuous social changes effected by the inauguration of collectivism being the equality of income and the publicity attendant thereon, the old motives for vulgar ostentation in furniture, apparel, hospitality, &c., and the reliance on mere cost to impress the beholder ceased to exist. Everybody knew to a farthing every other person's income, even that of compensates, and any affectation of superiority in anything but culture or ability became practically useless. The result was that as ability could neither be possessed or imitated at will, culture, and especially art culture (as the most easily affected by those destitute of both), became the standard by which social status was differentiated. People of pretension began to agree with one accord that homes were nothing if not artistic, that everything which could be made by hand rather than manufactured by the million ought to be hand-made, that mechanical repetition of design was vulgar, that no two things ought to be alike, that mere cost was nothing and artistic beauty everything, and so forth. This of course was the mere fashion of the day, selected because most other aspects of fashion were extinguished. But it had the enormous advantage of being a correct, true and priceless one, and what was largely an hypocrisy with the generation of 1905 became a virtue and an instinct with its successor from mere force of education and habit. Hence the resuscitation of all the splendid arts and lost crafts of the Middle Ages which has been so conspicuous a feature of the last quarter of a century, and which has given us the tapestry, the wood-carving, the hammered metal-work, the sculpture, the stained-glass, the furniture and the embroidery of our forefathers, all undefiled by the mould and the machine which had been the joy and adoration of the nineteenth-century "philistine" individualists.

A very short experience of the new *régime* indicated the imminence of a revolution in British art following on its introduction. Never before had there appeared such examples of ambitious (and successfully

* *The Great Revolution of 1905; or, The Story of the Phalanx.* With an Introductory Account of Civilisation in Great Britain at the close of the Nineteenth Century. By Frederick W. Hayes. London: R. Forder.

ambitious effort. The diversion of the whole output of the artistic profession into public channels (with the exception of course of such extra work as artists might execute in their leisure for their friends, or to exchange with brother artists, &c.) not only stimulated a generous rivalry amongst painters and sculptors, but enormously developed the popular interest in and enjoyment of art, while incidentally the artist as an individual began to acquire the status and prestige previously accorded to his contemporary and predecessor in France and Mediæval Italy.

Mr. HAYES in his pages looks behind as well as before, and in contrast with the happy time for artists he has described, he takes a retrospective glance at the condition of his art at the close of the nineteenth century, when the individualist principle prevailed. It cannot be objected to the following bitter remarks that they are the product of imagination alone:—

It may be safely said that down to the period under discussion scarcely any class had suffered so fatally from the curse of individualism as that concerned in the production of works of art. To all but a mere handful of artists, professional success depended on the accident of being patronised by a wealthy collector, on fighting, intriguing, or toadying for admission into one or more of the "close" societies, on being "farmed" by an influential dealer, on manufacturing continuously identical subjects and effects for "the trade," or on pandering to the vanity of women and parvenus as a fashionable portrait painter. A very limited amount of picture buying by municipalities for public galleries (probably a five-hundredth part of the sum similarly expended in France) was certainly carried on. But this was wholly controlled by small cliques of ignorant connoisseurs and prejudiced patrons, whose blunders, jobbery and favouritism were more injurious to art than total neglect would have been. Sculpture scarcely existed save in the shape of portrait busts, and the only branch of art really popularised (because supported by the whole community and not by a few plutocrats) was that of engraving and etching. An artist's only mode of access to the public was through the grotesquely insufficient medium of half a dozen fashionable exhibitions in London, the property of certain self-elected members. The list of one set of these artist-proprietors frequently coincided to a large extent with that of the others; while their whole aim was to make these concerns paying shops for themselves and their friends, and to direct the stream of art patronage, as far as possible, into their own galleries. The great dealers, making the larger portion of their profits out of single transactions at inflated prices, strained every nerve to keep down the number of the artists in whose works they found it convenient to traffic. This was for the all-sufficient reason that they had to depend upon the bribe of a paying investment to induce their plutocrat customers to buy, and were consequently obliged, for their own safety, to see that the works they sold did not fall in value at the sales of the leading art-auctioneers of the day. They therefore had a direct interest in having as few fancy reputations to bolster up as possible. In the meantime the Government Schools of Art (originally founded to enable artisan craftsmen, by means of an artistic training, to compete under fewer disadvantages with their French rivals) had been used almost solely by young amateurs of the middle classes, who flooded the market with their studies of still life, draped studio models and landscapes in imitation of fourth-rate continental artists.

It is fancied that as soon as all "business" (*i.e.* the mere handling of wealth and its products for the sake of commission or middleman's profits) becomes extinct, nearly the whole of the present machinery of distribution will be rendered useless. Miles of shops and huge blocks of warehouses and offices will then for the most part be features only of the past, their places having been taken by buildings more suggestive of national contentment in the shape of private residences, clubs and residential flats. It is easy to see, therefore, that London, and indeed all our great towns, will be called upon to undergo reconstruction, and by that a field of activity will be opened out which will have an area that is calculated to take away the breath of the humdrum practitioners of this unreformed generation.

It is almost superfluous to say that in the reconstruction of cities full advantage is to be taken of the opportunity offered to rid them of their present objectionable features. Acres of inferior property will be swept away, and coming generations will know only by report of the degradation of our modern slums. Mr. HAYES suggests the formation of great squares, and as regards the Metropolis, pictures the East End converted into an immense park, treating us to a vision of a glorified London that should find a warm approval by those who sympathise with the object, though differing with the *modus operandi*, of the author. How the vision is to be easily and naturally realised the curious must learn if they are so disposed from the book itself. The style is perhaps more vigorous than graceful, a fault that will be overlooked by those who are eager for the dawn of better times; but, on the whole, it is a work that will be found strongly suggestive of thought even to the man who remains uncompromisingly antagonistic to the principles it

enunciates. By asking the reader to suppose that a revolution which goes beyond all its predecessors can be accomplished within a space of eleven years is to make too great a strain on all who have only experience to guide them. If Mr. HAYES had postponed the Phalanx reign for a century or two, his pages would appear less extravagant.

"IS GOTHIC ARCHITECTURE A FAILURE?"—III.

[BY A CORRESPONDENT.]

(Concluded.)

THE best mouldings of the Early English period are not only charming in their great variety, but possess vigour where it is wanted, while the delicate little fillet is carefully proportioned as to its width, and the deep hollows with their cavernous shadows cunningly set where they "tell." The Early French treatment with its square orders and bold round mouldings has certainly far less variety in contour, though it has the merit of much decision. But for true grace the English mode is unsurpassed, and has the advantage of complete freedom from Classic types. While it soon became original the inception was from its mother, whose guiding hand it acknowledged till, later on, free from leading-strings, it pursued a separate distinct path of its own, but ever remembering the maternal suggestions and early help to its youthful footsteps. But to quit metaphor, the use of the circular plan in the abacus and upper mouldings of the capitals gave a greater variety to the perspective than was the case with the square or partly octagonal abacus. The architect who remembers his first efforts to sketch such mouldings can readily call to mind the great difficulty he experienced in correctly putting upon drawing-paper what he could see plainly enough. The capital with straight lines in its upper members is certainly more easy to draw. There is indeed a peculiar charm in the plan of the former, which the writer believes to be traceable to the theory he has propounded. There may be an emphasis about the sharp angles of a square abacus, and about the comparatively severe moulded arches that is lost in the circular one with the softer outlines both in the capital and above it. But on the other hand, the English treatment is the more graceful of the two. It ought to be a subject of thankfulness that these beauties are found not only in our stately cathedrals, or great abbey and collegiate buildings, but exist in many a gem of village church with which these favoured islands are nearly everywhere studded.

In vain does one search among the architecture of the Renaissance for anything in the shape of window tracery beyond that which is to be found in some of the Venetian palaces—two semicircular arches under a larger enclosing one of the same form, all having the same springing line, the intermediate space being filled up by a circle. If the architect ventured further he would get landed into Gothic tracery, which would be considered out of place. In the very late Flamboyant work of France, and in the peculiar Churriguesque style of Spain, with Classic and Mediæval features singularly and ungracefully mixed up, such tracery in windows and other positions occur. But the effect is *bizarre*, and the ornamentation does not seem to fit in properly. The limitation to a semicircular or segmental arch struck from one centre therefore effectually puts a stop to any further launching out in that form of decorative work—tracery—which is one of the glories of Gothic architecture.

There is another feature allied to window-tracery, in which the Mediæval men showed how much variety could be attained. This is the wall arcade, notably in the Early English period, when there was plenty of thickness of wall at disposal. There are many instances of that pleasing treatment of an arcade in two quite distinct planes, the one behind the other, the shafts at the back centring with the apex of the arches to the foremost arcade, the latter being foiled and the former simply pointed. A good example of this is seen in the interior of Lincoln Cathedral. But there is not the slightest reason why arcades of this description should be confined to ecclesiastical work. At the present time great municipal and other buildings are constantly being erected, such as were not put up during the Middle Ages in this land, when small countries like Belgium had their numerous great *hôtels de ville*, whereas, beyond

Westminster Hall and a few other examples, Great Britain possessed few. Nor need we of the nineteenth century reproach our forefathers for this scarcity, as the need of such structures was not then felt, our mode of living and social habits being so different to those of continental nations. In Mediæval domestic buildings this country is, happily, richer than over the Channel, thanks to our insular position, for the Civil Wars did not have the result of causing such destruction as might have happened had England been overrun by foreign aggressors.

Parapets in the Gothic times of this country were either made straight or embattled on the top, and if it was desired to emphasise them at the angles of the building, a pier surmounted by a pinnacle was put. In Roman architecture the same idea would perhaps be carried out by a pier of slight projection, carrying sculpture or a vase. It has been left to the present generation of architects to copy a debased form and sometimes to ramp the parapet at the angles with unfortunate effect. The old paths are the best.

In miniature tabernacle-work and in delicately-treated oak fittings, such as screens, pulpits, rood-lofts, font-covers, bench-ends, &c., there can be no question whatever that Mediæval work, in the period of the early part of the fifteenth century, greatly excels. Renaissance does not lend itself so readily to such details, whilst pinnacles, crockets and finials, buttresses, cusplings and such like in Gothic work afford an unsurpassed wealth of variety in which the able architect can revel with pleasure. In order to make a fair comparison, a man cannot do better than examine such a feature, for example, as the oak reredos of a Wrenian church in the City, and then go and look at the splendid Mediæval stone altar-screens still happily remaining in England, with their exquisitely delicate and minute detail in such abundance. The writer is instancing ecclesiastical Gothic work, but the same argument would hold good in any somewhat similar decorative adjuncts in a secular or domestic building, for the principle is similar.

There is a popular idea that the Gothic style is not adapted to large secular buildings, because the requisite amount of dignity and stateliness cannot be obtained in it as can be in Classic work. But these qualities certainly exist in the Houses of Parliament and in the much older Westminster Hall, for instance. To take three well-known Renaissance examples, *i.e.* the United Service Institution (formerly the Chapel Royal), Whitehall; Somerset House, and Child's Bank, Fleet Street—all of different dates. These buildings display the desired qualities more than the New Law Courts. The reason for this is that there are certain recognised stock elements in a Renaissance design which can be applied with sure effect. This is not so easy in a structure reared on Gothic lines, and requires more study. The municipal buildings in Belgium show what splendid architectural results were attained in the Middle Ages, with abundance of dignity, too. The goddess of Gothic art may well exclaim, "Save me from my friends!" for they have inflicted injury on her by their injudicious treatment. In the extension of the Record Office, on the east side of Chancery Lane, there is the same stereotyped form of traceried window that exists in the older part of the building. This is out of date for general use in secular work at the present day, as has been pointed out in an earlier part of this article. Surely if the eminent architect of this pile were now alive he would scarcely have adopted such a treatment.

There is another absurdity perpetrated not long since by some eminent architects of Gothic training, an absurdity that has been often condemned, but it appears to have been only "scotched," not killed. It is that old gargoyle who persistently contrives to peer out in the heights above, where he is not the least wanted, either for symbolic reasons or for utility. The most modern example that the writer has noticed (particularly when he pays his premiums) is that to the Metropolitan Life Assurance Society, Moorgate Street, where the gargoyles are in the turret over the principal entrance. Of course they are "make-believes" here, as in another older building in the City not far off—MAPPIN & WEBB'S, at the corner of Queen Victoria Street and the Poultry. Another Life Assurance Society's house is a like offender in this respect, *i.e.* the Prudential, Holborn, where the gargoyle looks even more ridiculous, as there is a down-pipe just beneath it. No doubt there is a character and

piquancy in this picturesque projection at the angles which all architects like, particularly in towers. At the church of St. Augustine, Queen's Gate, there are useless gargoyles to the west bell-turret, close to the porches, with entrance archways having that aspect. But it is a reflection on the talent and inventiveness of present-day architects that they do not soar above such "shams." It is superfluous to add that if due search were to be made, numerous instances of like absurdities in the Neo-Renaissance work would be discovered. But they are not so patent as the one just mentioned, and are therefore more excusable.

There is one fine and important building, St. Paul's School, West Kensington, not long since erected, which is essentially Gothic in its style, and being situated in an open part of the suburbs is exceptionally fortunate in its favourable site, facing a great high road, with a good space in front of it and an unencumbered position towards the west and south, though it is not quite so open on the east side. The architectural treatment is mainly in the feeling of Early Perpendicular, as particularly evidenced by the fenestration; and it is unquestionably a very stately looking fabric, just such as a great public school ought to be. When the very ruddy hue of the terra-cotta and brickwork has toned down (which process seems a long time about), this structure will look even more dignified than it does now.

The City Guilds building in the Exhibition Road, South Kensington, another work by Mr. WATERHOUSE, is also stately, but is not Gothic. The designation would probably be Neo-Renaissance, and there is a good deal of Mediæval spirit about it, though it would be difficult to pick out an individual feature and call it of that style. As in this eminent architect's other excellent works, there is a certain stiffness. But Mr. WATERHOUSE is never vulgar in his treatment and does not overdo his ornamentation. He eschews meretricious decoration, so that there is always a suitable amount of repose in his designs. In the Natural History Museum he has given to London a very dignified and appropriate building for its purpose. Its columnar character gives much help in that respect, while the style is consistent throughout, based on a Romanesque *motif*, but handled throughout with some degree of originality. The least successful productions of Mr. WATERHOUSE are probably the collegiate additions at Oxford, but here he sins in good company. The writer has somewhat enlarged on this particular architect's manner, not with any object of making invidious comparisons, but because he considers one of the chief merits of this master is, that in whatever style he works he sticks to it, and thus avoids the semblance of a jumbled cluster of odd fragments put side by side, which is one of the banes of some of the fashionable architecture of the day. No doubt at times this restraint may involve a want of grace, which other less scrupulous practitioners contrive to infuse by means of bastard details, adroitly inserted where they "tell" best. In ancient Elizabethan and Jacobean work Italian architecture was converted into a distinctly native style, grafted on to the Mediæval, and thus appearing to grow naturally out of it. Whereas in the structures of the present day, little morsels of Renaissance are oftentimes capriciously tossed into a kind of Gothic pie, where they look out of place and as if they had dropped in there by accident. There is a beautiful building, recently erected in Piccadilly at the east side of Eagle Court, close to the Circus, which is essentially of the Italian Renaissance style, except in the elegant miniature columns employed instead of balusters, carrying the copings of the balconies, which are of Italian Gothic character. Yet this mixture does not impress the eye as being incongruous, for in the words of the refrain of a popular song that used to be greeted with great applause at the defunct Evans's, "It all depends upon the way in which it's done." In the case in point, to continue the metaphor, the mixture was evidently prepared by a skilful physician.

In concluding these remarks, which might of course have been pursued at much greater length, the writer has endeavoured in a measure to thus briefly indicate an answer to the question asked at the commencement of this article.

Mr. J. D. Webster, Sheffield, has been appointed to the vacant diocesan surveyorship for the diocese of York.

BRITISH SCHOOL AT ATHENS.

LAST week we briefly noticed that a meeting of the British School of Archæology had been held at 22 Albemarle Street. The chair was taken by Mr. Bryce, M.P., and there were present Lord Ribblesdale, Mr. and Mrs. Asquith, the Hon. Reginald Lister, Mr. F. Elliot, Professor Lewis Campbell, Professor Pelham, Rev. J. E. C. Welldon, the Provost of Oriel, Professor Butcher, Mr. Sidney Colvin, Mr. F. C. Penrose, Mr. and Mrs. Theodore Bent, Mr. Walter Leaf, Mr. Hamilton Lang, Admiral Sir Erasmus Ommanney, Dr. Sandys, Mrs. Ernest Gardner, Dr. Waldstein and others. Letters of regret had been received from Mr. John Morley, M.P., Mr. A. J. Balfour, M.P., Professor Jebb, M.P., the Head-masters of Eton and Winchester, the President of Magdalen and the Vice-Chancellor of the University of Cambridge.

The hon. secretary, Mr. George A. Macmillan, read the report of the managing committee for 1893-94, which stated that though the number of students was rather below the average, and the one piece of excavation undertaken (on the site of Abae) was hardly so fruitful as had been expected, the school had held its own, and had attracted more pecuniary support than in any recent session. After a short account of the work of Mr. A. G. Bather, Mr. E. F. Benson, Mr. J. L. Myres, Mr. V. W. Yorke, Mr. D. G. Hogarth, Mr. E. R. Bevan, Mr. Gilbert Davies and Mr. Arkwright, the report said that the site of Abae, in Phocis, was chosen for excavation after very careful consideration. It was famous for its oracle, and reference was made not only by Pausanias, but by Herodotus and Sophocles, to the oracle, the fortress, and the temple of Apollo. The indications on the spot seemed full of promise, but after some three weeks' work, carried on in very severe weather, the excavators succeeded only in laying bare the plan of the temenos, with a temple, a *ναῖσκος* and a stoa. The whole place must have been sacked, for of sculpture only a few late fragments were discovered, and a few inscriptions, mostly of Roman date. Some bronze bowls of early technique were the only artistic product of much importance. On the adjoining site of Hyampolis some inscriptions were found, but nothing else of consequence. Mr. Benson had made an encouraging report on the prospects of archæological discovery at Alexandria, but for this purpose there were not anything like adequate funds. There was, however, an active archæological society in Alexandria itself, which had already done no small amount of work with very limited funds. Arrangements had happily been made to prolong the services of the director, Mr. Gardner, whose college fellowship and Craven studentship had expired, and who would, in the absence of further aid, have been obliged to resign. But by the efforts of Mr. Egerton, the British Minister at Athens and others, the committee had been able to reappoint Mr. Gardner for one year only at a salary of 500*l*. A special fund was being privately raised to meet the additional expenditure, and most opportunely a grant of 200*l*. had been made to the school from the Royal Bounty fund. The relations of the school with the other foreign schools in Athens and with the Greek archæological authorities had, as usual, been most friendly. Every facility was given by M. Kavvadias and his colleagues for carrying on the work at Abae, and special mention was due to the courtesy of M. Homolle in allowing the director of the school to examine at leisure the remarkable discoveries made by the French school at Delphi. The director and students had also had the advantage of following in detail the excavations still being carried on with so much success by Dr. Dörpfeld on various sites in Athens. The list of donations to the school had been considerably above the average of former years. It appeared that the French school enjoyed an income of more than 3,000*l*., and the German school an income of 2,000*l*. Both these schools were endowed by their respective Governments, but even the American school, which was of much later foundation, and depended upon the voluntary contributions of various colleges, could command an income of about 1,400*l*. a year. These facts formed in themselves an irresistible argument for enlarging the precarious income of 450*l*. upon which the British school now depended. In the autumn of 1893 the Hellenic Society renewed their annual grant of 100*l*. for another period of three years. The report concluded with an earnest appeal for further funds to enable the school to carry on its work in a manner worthy of the name it bore.

Mr. Bryce in moving the adoption of the report expressed his pleasure that Alexandria had been chosen for excavation. Great results might be expected from well-directed efforts in that city. Alexandria was covered with immense heaps of rubbish, and under the earlier period of Mohammedan domination was practically reduced to a waste. It was satisfactory also to note that work had been carried on in Cyprus and Lysia, as well as at Athens. Besides the direct work of teaching, the school rendered great service to visitors to Athens who were interested in archæological work. It was not, however, satisfactory to find that the school laboured under such financial embarrassment, especially when one found that the French,

German and American schools were in the enjoyment of such comparatively ample resources. Three ways might be suggested of increasing the funds of the school. First, there were the universities and their colleges. But those institutions were suffering severely from the agricultural depression; and the colleges had in many cases had to forego a large part of their dividends, which amounted in some instances only to one-half or even one-third of what they were fifteen or twenty years ago. The common funds both of Oxford and Cambridge were also at a very low point. Still Oxford was giving 100*l*. a year, though Cambridge was unable to help. The question was whether much of the money now devoted to prize fellowships would not be better spent on this work. Each university might, for example, in turn appropriate the income of a fellowship and enable the school to bridge over its difficulties, for there was little doubt that it would ultimately establish itself on a firmer basis. A second source was private benefaction. This, however, was unfortunately not a favourable time to appeal to the great landowners, in whose bosoms fears were being excited from another quarter. But there were many in this country whose fortunes had not been affected by agricultural depression, and to them an appeal might be made to enable the school gradually to get into easier circumstances. Thirdly, there was the State. Unhappily there were so many who could put in good claims for public assistance that the Treasury had been obliged to act on the principle of refusing all impartially. The demands of Asia Minor, University colleges, University extension and other admirable objects were constantly pressing the Chancellor of the Exchequer. It was almost a pity that the old indirect forms of endowment were no longer possible. Appointments in the State and the Church were no longer bestowed as a reward for classical study. The Greek play bishop was a thing of the past. Our nobility, too, no longer travelled *en grand seigneur*, or brought home artistic treasures as they did one hundred years ago. At the same time, if a claim were fairly and squarely made in Parliament he did not think there would be any unwillingness to respond. There was still much to be done in continental Greece, and even sites less famous than Delphi or Olympia might disclose valuable treasures. The Mediaeval history of Greece raised a series of problems which archæology might do much to solve. The Byzantine churches might throw great light on the past. Then in the islands—as might be inferred from such a book as that of Mr. Tozer on the *Ægean*—the philologist might investigate the Greek dialects with the hope of fruitful results. There was work to be done in the search for manuscripts in Egypt and in the inquiry into Hellenic remains in that country. Greek manuscripts of great interest also might reward our labours and the sources of Greek achievement in art, science and politics might be more fully traced for the delight and instruction of mankind.

Mr. Welldon seconded the motion.

Mr. Asquith said that he had not come with any intention of making a speech, nor had he any qualification which could add weight to the authoritative appeals which they had just heard. When he was at school and the University the study of classical archæology was regarded, he would not say as an eccentricity, but as a luxury, which the student who wished to do well in the schools might forego. He was glad to think that was no longer the case, because nothing could introduce more vividness and vitality into classical study than this form of research, which enabled us in a way beyond the means of literature to reconstruct the forms of ancient society. This school was enabling us to recover and decipher some of the lost pages in human history. There was no object for which an appeal might more legitimately be made. It was with shame that he heard that we were doing so little in comparison with other countries.

TESSERÆ.

S. Francesco della Vigna, Venice.

THE plan of the church of San Francesco della Vigna was prepared by Sansovino. A representation of the façade is given on a medal struck in 1534, but the patriarch of Aquileia, at whose expense it was to be built, not thinking it sufficiently magnificent, employed Palladio in 1562 to make the design which was afterwards executed. It appears that Sansovino's plan already begun was in 1533 submitted to Francesco Georgi, a brother of the convent, who proposed to rectify the proportions according to what he called Platonic principles. "I would," said he, "that the width should be of nine paces, nine being the square of three, a prime and a divine number; and that it should have a triple proportion to the length which should be of twenty-seven paces, forming a diapason and a diapente;" and then he goes on to say that this relation and harmony was appointed by God himself, who thus fashioned the world and directed Moses to observe it in the tabernacle, which was to be made according to the model shown to him on the mountain; which model according to the

opinion of the wise was the world itself. The author proceeds through all the parts of the church in the same style. That men should have such dreams, that they should write them, may not be a wonder; but that they should think such dreaming to be reason, that they should publish them as such and that the world should ever have received them as such does seem to be a little marvellous. With all these harmonious proportions, however, or without them the inside is not beautiful; the outside does not at all correspond with it and nobody need doubt that the building was the work of two architects. Palladio's churches have all one general disposition in front, a pediment in the centre supported on half columns and a sloping roof on each side resting on a smaller order, whose horizontal cornice is continued more or less perfectly in the intervals between the larger columns. The effect is always in some degree as if a great pediment over the smaller order had been cut away for the purpose of introducing the larger, and on this account it would be better entirely to omit all trace of the smaller order in the intervals of the larger. However, though not absolutely perfect, these buildings are very graceful; and hitherto no better mode seems to have been adopted for accommodating Roman architecture to the usual disposition of a Christian church. In the present example, the lower cornice is only continued in two or three flat members in the intercolumns, and there is a small projection in the wings on which the cornice returns, so that these flat mouldings alone are interrupted by the columns. Both orders are on a high continued pedestal, which breaks round the principal columns and is cut through to admit the door. Over the door is a large semicircular window.

French and English Renaissance.

In comparing the French and English modern schools of architecture, Le Grand, in his "Essay," has very candidly admitted our superiority. "The English," he says, "adopted Palladio, whilst we have followed the orders of Vignola, but with this difference—they adopted the plans of Palladio entire, and accompanied by all their elegance and simplicity, whilst we have applied the orders of Vignola to the most complex shapes in our buildings, and which we have overloaded with whimsical ornaments of the very worst taste, and the result of a comparison between the ancient architecture and ours is that our own is complex whilst that of the ancients was simple; theirs exhibits grand ideas in the most trifling edifices, whilst ours, in the execution of the greatest objects, are but a collection of small parts, and those united with difficulty, which is mis-called ingenuity." The fact is the French were ambitious of forming a new school; they were to invent new orders which were to be exclusively French, and their buildings in the age of Louis XIV. exhibit examples in which all kinds of incongruous ornament are collected together without principle or meaning. To this succeeded what they conceived to be the pure Grecian taste, but as it was before the Grecian monuments had been studied or understood, this second manner was in truth very little more elegant or perfect than the former. They are scarcely ever successful in their attempts to adopt the styles of antiquity, although there is no nation so prone to affect a species of classical show, and none more ambitious of giving to the productions in art a classical air. This is observable particularly in their school of design and in their drama, and yet it is impossible to contend that they have been successful. The difference of taste and manner between the French and the English may, perhaps, be accounted for in some degree by their different modes of study. The French, both in their studies and in their pursuits, adopt more of the academic system than is followed in England; they work in bodies and under the direction of the Government, whilst our most laboured productions are the works of individuals, and consequently more likely to afford specimens of originality, if not of perfection. Without entirely denying the benefit of academies for the advancement of the arts, it is only from frequent experience of their failure through mismanagement that the argument arises against increasing their number or extending their influence.

Maltese Buildings.

Instead of stuccoing the walls the Maltese builders cover them with a whitewash as thick as paste, and lay this over the mouldings as well as on the plain surface—a plan destructive of all beauty of detail. The village churches in Malta are remarkably fine, and one in particular at Zeitun would merit minute examination. We see there, as in some places in Italy, a range of lofty open arches, rising above the external wall of the side aisles to screen the roof. The judgment is not altogether satisfied with this piece of magnificence, because the idea is excited that it is intended in some measure to conceal the construction, and it seems too much for such an object, yet the eye is pleased. There is also a great deal of architecture in the private houses in the villages. A decorated doorway with a window on each side and a bold projecting balcony over it is the usual disposition. Sometimes the house is continued above this, with a large arch opening on to the balcony; sometimes the higher

part of the edifice is set back and the balustrade of the balcony is continued in front of a terrace, and in either case the appearance is very handsome and the parts are never crowded together. The fault of these villages is that they have nothing rural about them. The houses are placed close together, or at least with few and small intervals, and one or two palm-trees, with a few carobs, figs or cactus peeping above the stone wall is all that can be seen of vegetation.

Materials and Architecture.

In the erection of the great abbeys and collegiate churches, where no expense was spared, the materials were frequently fetched from great distances. Thus the soft freestone of Caen in Normandy was used in the construction of many of the principal churches and conventual buildings of the south and east of England. But in building private houses the cost of carriage was too great to admit of the use of such distant materials. Hence stone houses are only or chiefly to be met with in those parts of the country which possess beds of workable stone; as, for instance, upon that generally broad band of oolitic freestone which, beginning in Dorsetshire, stretches in a north-east direction across Somerset, the north-west of Wilts, Gloucester, Oxford, Northampton, Lincoln and the northern extremity of Yorkshire. It is upon, or within a short distance of this tract, that we meet with nearly all the most noble and decorated specimens of early Domestic architecture, as well as a rich assemblage of churches—all highly ornamented, in consequence of the easy-working character of the freestone. It is, however, greatly to be regretted that in some parts of the range this stone is liable to weather, as it is called, or scale off; a circumstance from which the splendid buildings of Oxford, in particular, have suffered such cruel mutilation. Eastward of this line runs the range of chalk hills through the counties of Dorset, South Wilts, Hants, Berks, Bucks, Hertford and Cambridge, branching off likewise into Surrey and Kent. In these, flints and hard chalk are the ordinary building materials, very unfavourable to architectural purposes, and occasioning a paucity of handsome ancient residences throughout that district. In the exceptions which occur, as at Cambridge itself, the stone has been laboriously brought from the neighbouring oolite range. In the remaining eastern counties the soil chiefly consists of alluvial clays and gravel, and compelled the adoption of bricks as a substitute for stone in the construction of houses of every class, by which the prevailing character of their architecture was materially affected. In London, however, the buildings are said by Stow to have been chiefly of wood up to the time of James I., who, by divers proclamations, enforced the use of brick and stone, as well, it is said, for the sake of preventing the too rapid consumption of our native forests as for security against fire. In the western and many of the midland counties, Devon, Worcester, Shropshire, Cheshire, Stafford, Leicester, Warwick, Nottinghamshire, &c., where the deep marly soil which geologists call the new red prevails, and which were anciently covered with extensive oak forests, timber has been always the principal material employed in the construction of houses. It is in this district that we still see so many of those picturesque buildings in which the wooden framework, painted black, contrasts so strikingly with the intervals of white plaster. Where the hard beds of stone which are interstratified with the marl have been employed, as in so many of the churches of these counties, the destruction occasioned by its weathering has been usually greater, even than what we have remarked of the Oxford oolite. Lamentable indeed is the condition of many of their exteriors. Their sculptured ornaments of every kind, pinnacle and crocket, cusp and foliated capital, are all corroded into shapeless knobs while each separate stone of the angles or flat wall is worn down by repeated exfoliations of the edges to a round lumpish form. The natural dingy red colour of the stone, by itself unfavourable, completes the disfigurement of the building. The architect or antiquary may study with interest these faded beauties and glean some information even from their unsightly remains; but, as architectural objects, their power of exciting general admiration is gone for ever. The same remark is unfortunately applicable to many of the otherwise most beautiful buildings of Scotland, where this red sandstone is still in common use, and little attention paid to its want of durability, so lamentably attested.

The Cathedral of Pisa.

Internally the building forms on the ground-plan a Latin cross, with double aisles to the nave and square part of the choir, with sixty-eight columns supporting arches on the ground-floor and four piers supporting an elliptical dome. The lateral tribunes, however, do not open entirely into the nave, and consequently rather appear as two additional edifices than as forming what should properly be called a transept. Above the first order there are galleries, with a pier over each column below, and supporting an arch of the same extent, but divided into two smaller arches by the help of a little intermediate column

Above these arches is a high wall, in the upper part of which are small semicircular-headed windows. Milizia sneers at these insignificant openings; yet they shed a pleasant diffused light, without ever becoming in themselves important objects. The ceiling is flat, that of the side aisles alone is vaulted; thus you see the internal disposition is very much like that of some of the Roman basilicas. The galleries of the choir are rather higher than those of the nave, and the Pointed arch occurs at the extremity of the latter. The lower columns may be classed in two sizes, those which divide the side aisles being smaller than those of the nave, but each range has varieties. The larger are of granite; of the smaller, some are granite, some marble of various sorts, two or three are fluted, the rest are plain, and these smaller columns differ also in height, giving sufficient proof of their having been made up of the materials of more ancient buildings. Some, perhaps, were brought from the East, as the Pisans carried on at that epoch a very extensive commerce. Some of the capitals are Composite, but more are Corinthian, and these vary in diameter, height, character and proportion to the column. The apophysis is generally large, and the bases are of meagre and ill-understood Attic, but not all precisely alike or bearing the same proportion to the columns. One base only is of the form peculiar to the Corinthian order. Some of the granite appears to be that of Sardinia or of the Isle of Elba, and columns of this material could hardly have come from the Levant. We may observe also pavonazzo, cippolino and Egyptian granite. A large plinth at bottom and a sort of pedestal above the capital have enabled the architect to spring all his arches from the same height.

Physical and Moral Elements in Painting.

The brilliant antithesis ascribed to Simonides, that "painting is mute poesy, and poetry speaking painting," made no part of the technic systems of antiquity. For this we may depend on the general practice of its artists, and still more safely on the philosophic discrimination of Plutarch, who tells us that as poetry and painting resemble each other in their uniform address to the senses for the impression they mean to make on our fancy, and by that on our mind, so they differ as essentially in their materials and their modes of application, which are regulated by the diversity of the organs they address—ear and eye. Successive action communicated by sounds and time are the medium of poetry; form displayed in space and momentaneous energy are the element of painting. As, if these premises be true, the distinct representation of continued action is refused to an art which cannot express even in a series of subjects but by a supposed mental effort in the spectator's mind the regular succession of their moments, it becomes evident that, instead of attempting to impress us by the indiscriminate usurpation of a principle out of its reach, it ought chiefly to rely for its effect on its great characteristics, space and form, singly or in apposition. In forms alone the idea of existence can be rendered permanent. Sounds die, words perish or become obsolete and obscure, even colours fade—forms alone can neither be extinguished nor misconstrued; by application to their standard alone description becomes intelligible and distinct. Thus the effectual-idea of corporeal beauty can strictly exist only in the plastic arts; for as the notion of beauty arises from the pleasure we feel in the harmonious co-operation of the various parts of some favourite object to one end at once, it implies their immediate coexistence in the mass they compose, and therefore can be distinctly perceived and conveyed to the mind by the eye alone; hence the representation of form in figure is the physical element of the art. But as bodies exist in time as well as in space, as the pleasure arising from the mere symmetry of an object is as transient as it is immediate, as harmony of parts, if the body be the agent of an internal power, depends for its proof on their application, it follows that the exclusive exhibition of inert and unemployed form would be a mistake of the medium for the end, and that character or action is required to make it an interesting object of imitation. And this is the moral element of the art.

Absorptive Properties of Bricks.

It would appear reasonable to assume that in the general way of building near London the mean weight of water absorbed by the bricks will not be less than 10 oz. per brick, particularly when the bricks are made on the spot and at once put into the work without previous exposure to the air. Excepting indeed in the case of a few bricks of very superior description, or of stocks specially selected for their hardness and semi-vitrified appearance, the quantity of water absorbed by the ordinary building bricks experimented on is in few instances less than this. It is estimated that a rod of brickwork requires 4,300 stocks and 86 cubic feet of mortar, of which we may assume about 39 cubic feet to be of lime, if the lime be grey. The 4,300 bricks, if dry, will absorb 43,000 oz. of water, and the 86 cubic feet of mortar will, if made of average lime and of average consistency, require about 32,000 oz. of water in its preparation, of which 8,000 oz., or

thereabouts, will enter into chemical combination with the lime, and quite 2,000 oz. be lost by evaporation. Under such circumstances we have therefore some 22,000 oz. of water in the mortar joints free to pass off to the bricks, and these have a power of absorbing 43,000 oz. The conditions in brickwork are of course less favourable to absorption than when the bricks are actually immersed; but, on the other hand, evaporation from the brick will occasion some loss of moisture (and in thin walls such loss will be considerable), before the mortar can set. In an experiment tried at Chatham on single bricks placed one on the other, the joints being subjected to a pressure of 56 lbs. for two hours, and their mean absorption when immersed being 15.7 oz., the bricks drank in on an average 2.7 oz. each. Taking two-thirds of this to represent the degree to which the stock bricks of the absorptive power above assumed would have imbibed water, we have, without reckoning that of the smaller faces, 1.8 oz. as the weight of water which would be taken per brick in a 4½-inch partition in the same time if similarly weighted, or for the rod 7,700 oz., being in two hours more than one-third of the total amount of water which the joints contain. Such calculations are of course very rough approximations to the actual truth, but they are sufficient to show that under such circumstances the mortar in contact with the bricks cannot retain the moisture which is required for the induration of hydraulic limes, and indeed, although few English engineers or architects now think of specifying that the materials used with lime mortars shall be wetted, those who have paid attention to the subject have well known its necessity and clearly stated it. Partington, in his "Complete Builder's Guide," says that "few workmen are sufficiently aware of the advantage of wetting bricks before they are used, but experience has shown that works in which this practice has been attended to have been much stronger than others in which it has been omitted." Amongst the circumstances which contribute to the speedy ruin of modern buildings he places the use of mortar "with dry bricks, and not unfrequently with warm ones." Rondelet, in his "Treatise on the Art of Building," says "that, in order to make the mortar unite better with the stones, it would be of advantage that the workmen should have near them a great bucket or trough of water, in which they should soak the stones before laying them, and a basket with open wickerwork for the spalls, which should be soaked in the same manner before mixing them with mortar. This mode of proceeding, which I have seen practised in many parts of Italy, is excellent for works which are to contain water, &c." Vicat writes:—"The whole secret of good manipulation and right employ is condensed in the following precept: stiff mortar and materials soaked." Our bricklayers, on the contrary, seem to have taken for their motto, "Dry bricks and drowned mortar."

Strength of Fortifications.

It has been argued that it is of little use to strengthen revetment walls and the buildings in fortresses, because nothing in the shape of masonry can resist artillery; but there is abundant evidence to show that the amount of fire requisite to produce a breach, all other things but the masonry being equal, is very different. Sir John Jones asserts that the walls of the south of Spain required twice as much firing to destroy them as the brick revetments of the north of Europe, and he attributes the difference to the superiority of the Spanish mortar. At St. Sebastian the distance of the batteries from the wall breached was 620 yards, at Ciudad Rodrigo, 570 yards. The revetment at St. Sebastian required 5,000 shot to form a breach of 30 feet, at Ciudad Rodrigo only 2,080 for a breach of the same width, and it was noticed that the first was of good masonry, the second of bad. The tower at Bomarsund caused surprise by the facility with which its masonry was destroyed. The revetment at Antwerp caused the French thirty-four hours of firing to produce a breach, and we may assume the brickwork to have been of the ordinary description found in northern Europe; this period would have been doubled, according to Sir John Jones, if the revetment had had the resistance of the walls of the south of Spain.

The Palace of Versailles.

Never perhaps was so complete a failure as the mass of incongruities at Versailles, and never such a profuse squandering of treasure and even of life. Dulaure, in his "History of Paris," states the expenses (including the moving of hills and the various other projects) at the incredible sum of forty-eight millions sterling; from twenty-two to thirty-six thousand labourers were constantly employed on the works. A camp was formed for the workmen near the spot, the limits of which were strictly guarded; and it was criminal even to notice the vast waste of life in the soldiers employed, 10,000 of whom are said to have fallen victims to excess of fatigue, and to an epidemic disease caused by the exhalations from the swampy ground.

NOTES AND COMMENTS.

A LETTER from the Rev. G. C. BELL, formerly head-master of Christ's Hospital and a member of the present Council, mentions five causes to which the diminution of the annual income of Christ's Hospital may be ascribed. They are:—

1. The fall in rents of the agricultural estates of the hospital, which form a considerable fraction of its whole property.
2. The falling-off in the benefactions from donation governors, which is said to be due to the curtailment of their privileges by the provisions of the new scheme.
3. The falling-off in legacies from similar causes.
4. The policy pursued by the governing body before the new scheme became law in 1890. In face of the loss of revenue from the three preceding causes, the Governors continued to admit children in larger numbers than the annual income would support, selling stock to cover the deficit. The permanent loss of income due to this policy has been considerable.
5. The fact that over 112,000% of capital was exempted by Parliament from the operation of the scheme. Over this the old governing body have retained their control, which has recently been confirmed by a judgment in Court. On the other hand, Christ's Hospital still possesses a net income of 50,000% a year. As fees varying from 10% to 20% a year can be paid by two-thirds of the pupils in the new boarding schools, about 10,000% a year can be calculated on from that source. There will be also the interest on the money, probably half a million, that is to be derived from the sale of the site in Newgate Street. The Council have, however, a right to assume that so ancient and useful an institution will, at the present stage of its history, receive liberal support from the citizens of London. Experts have long since concluded that the centre of the City is no longer a proper place for a school from which day boys were excluded. At St. Paul's School a different rule was exercised, the boys had the advantage of change of air every day. Yet, for sanitary reasons, the school was removed to Hammersmith. It is hard to keep boys immured in the City for nine months, when they could receive even a better education in a more healthy place. It is too late now to rebel against the scheme for the removal, for all that could be said in opposition was expressed long ago. It is true the site selected is not approved by experts, and, we imagine, it is one of the causes of the present commotion. The Council would, therefore, do well to consider whether by abandoning it and selecting another less remote from the Metropolis, they would not change many of their opponents into supporters.

As the constitution of local boards varies from time to time, it is to be expected that their decisions cannot be marked by uniformity. The arrangement of building lines in consequence is sometimes rigidly kept to a normal line, while at other times deviations are tolerated. A case which Mr. Justice NORTH has heard denotes what inconvenience may arise from the absence of uniformity. The Sutton Local Board applied for an injunction to prevent a grocer from rebuilding his premises in the High Street because he had not respected a line of frontage which had been prescribed. The defendant had submitted plans for a new building on the same site as one which he had taken down. The Board declined to approve of them unless the frontage was set back 6 feet. During the time the Board were deliberating, the rebuilding was commenced, and proceedings were therefore taken to suspend the operations. The defendant relied on the want of uniformity which was seen in the dealings of the Board. The houses on each side of his site were erected without any departure from the old lines, and no general line had been fixed for the High Street. From the defendant's point of view the conduct of the Local Board was arbitrary, which is one of the worst qualities of any sort of government. The judge was, however, bound to assume that the Board was inspired with an intention to carry out loyally the provisions of the Public Health Act, and it must therefore be left to their discretion whether an improvement was to be carried out in its entirety at once or was to extend over several years. The injunction was granted.

THE "pari mutuel" system of betting has brought many Frenchmen to ruin. The levies on it which are imposed by the authorities as the price of connivance are, however,

useful aids towards the erection of buildings for benevolent purposes. Two projects have just received sanction from the Paris Municipal Council. A sanatorium for phthisical patients is to be erected at Angicourt, near Liancourt, at a cost of 800,000 francs, and the whole of the money is to be derived from the "pari mutuel." A building is also to be erected in connection with the great St. Louis Hospital in Paris for children suffering from skin diseases. It will cost 1,500,000 francs, and three-fourths of the sum will be provided from the same source.

THE panorama appears to have become indispensable in Paris. M. POILPOT has no sooner completed one large work of the class than he finds another is awaiting him. Formerly landscapes were supposed to be the special subjects of panoramas, which it may be mentioned were devised exactly a century ago by ROBERT BARKER; but in modern works figures have preference, and especially men engaged in battle. M. POILPOT's projected panorama, which is announced, will celebrate the three CARNOTS. It will comprise representations of the events in which LAZARE CARNOT, the "Organiser of Victory" in the first Republic, was a participant, and especially the battle of Wattignies, which was gained under his command. No less important in another sense were his works on the "Métaphysique du Calcul Infinitésimal" and the "Géométrie de Position," but they are not paintable subjects. His son, HIPPOLYTE CARNOT, was an actor in the revolution of 1848, which will give an opportunity for the introduction of at least one stirring scene. The Presidential career of the lamented SADI CARNOT will form a pictorial history of France during the past seven years. As M. POILPOT has been able to secure the co-operation of M. T. CHARTAN, there is no doubt the portraits will be of exceptional merit.

ALTHOUGH there has been an extraordinary delay in setting out the contents of the Antwerp Exhibition, a visitor will not suffer the disappointment that was inevitable a couple of weeks ago. As the representatives of the various sections who form the international jury in the sections of fine art have arrived, it is evident that order has commenced to reign in what was chaos. At the first meeting of the jurors it was unanimously decided to elect M. ALBRECHT DE VRIENDT, the director of the Antwerp Academy, as president, and he was entitled to the honour not only on account of his official position, but from his eminence as an artist. Reproductions of some of his historical paintings have already appeared in *The Architect*. M. BOUGUEREAU, the French painter and president of the Société des Artistes Français, was chosen as vice-president of the jury. M. EMMANUEL DE MEESTER was appointed secretary. M. RAVILIN is the president of the Architectural Section; M. EUGENE PELIN, the Austrian artist, is over the jurors of the section of painting in oils and water-colours; M. ETIENNE LEROUX holds the same office for sculpture, and M. LAMOTTE for engraving, &c.

THE Commissioners for the Exhibition of 1891 have made the following appointments to Science Research Scholarships for the year 1894, on the recommendation of the authorities of the respective universities and colleges. The scholarships are of the value of 150% a year, and are tenable for two years (subject to a satisfactory report at the end of the first year) in any university at home or abroad, or in some other institution approved of by the Commissioners. The scholars are to devote themselves exclusively to some study which is important to the industries of the country:—University of Edinburgh, JOHN CARRUTHERS BEATTIE, B.Sc.; University of Glasgow, JAMES ROBERT ERSKINE-MURRAY, B.Sc.; University of Aberdeen, WILLIAM BROWN DAVIDSON, M.A., B.Sc.; University College, Bristol, REGINALD CHARLES CLINKER; Yorkshire College, Leeds, FRANKLAND DENT, B.Sc.; University College, Liverpool, ALFRED JAMES EWART, B.Sc.; University College, London, DAVID KING MORRIS; Owens College, Manchester, JULIUS FRITH; Durham College of Science, Newcastle-on-Tyne, ROBERT BEATTIE, A.Sc.; University College, Nottingham, WILLIAM BECKIT BURNIE; Queen's College, Galway, JOHN ALEXANDER M'CLELLAND, M.A.; FRANK BOTELER KENRICK, B.Sc.; FREDERICK JAMES ALEXANDER M'KITTRICK, B.Sc.

THE CHIMNEYPiece.

By P. MORLEY HORDER.

THE interior decoration of our domestic buildings has always been more or less centralised by the fireplace, and it would be hard to think of a beautiful room robbed of this feature. Domestic buildings of all countries, whatever their climatic exigencies, have generally emphasised one portion of their living-rooms by such a feature, associated with the household Lares if not always with warmth and comfort. In England more than any other country the hearth has always been a gathering-place *par excellence*, a symbol in the mind's eye fraught with every domestic happiness. Here the master builder of old grew fanciful and exerted all his skill, here he consummated and drew together the various decorative lines of his room in almost wilful license of carving and quaint image. Modern ingenuity has relegated the log fire and open hearth into desuetude, although it is affected still by those anxious and able to have anything out of the ordinary. But the chimneypiece is still a feature in all rooms—in fact, machinery has given the smallest houses singular opportunities in this way, and the monumental proportions of many that are to be seen in quite small rooms would, in point of size and display, dwarf many an old one built for a lordly hall. The comparative study of an ancient and modern chimneypiece is fruitful of much reflection, and helps to a clearer definition of the principles that seem naturally to govern satisfactory wall-decoration. Turning over the pages of Nash's "Mansions of England," a thought suggests itself—What sort of a volume would a modern Nash produce if he attempted to illustrate the houses covering a period as long in modern times? Look for a moment at Nash's topographical sketches of interiors. Here are chimneypieces of the most elaborate and the simplest detail, but in every case the prevailing treatment of the room accords with this central feature, and where there is elaboration it is made legitimate by a proportionate redundancy of surrounding. A lofty and elaborate chimneypiece is balanced and made part of the wall by having its main lines carried round in panelling and enriched friezes. Then, too, look how the doors and windows are dignified and made architectural by perfectly-arranged and continuous lines of moulding. In short, the decoration is inevitably an outcome of the architecture, whose limitations are the best argument for the tendency of its lines.

The central truth of a study of these old examples is, then, that all good decoration is architectural—a beatification of the actual walls. Scattered up and down the land there are modern houses built by individuals fortunate enough to employ men who instinctively recognised such principles, and whose crowning pleasure in their work was reached when they were allowed to complete their architectural framework with a vesture of architectural decoration. A latter-day Nash might fill a volume with really beautiful examples of this century architecture in this way, but his record would be an exhibition not of national tendency but individual effort. Generally speaking, the ready-made chimneypiece is a symbol of no small significance; it is the sign-manual of the mere decorator—an individual whose knowledge is more of upholstery than architecture, whose existence is largely due to the mere professionalism of architects, more anxious for the accumulation of commission than the finished beauty of their buildings. Because small matters of internal finish ill repay the profession, rooms are generally left bare by the architect, to be decorated or furnished by another hand. The ready-made chimneypiece is inserted at the discretion of anyone, and will have no possible relation to the room. Erected over the fireplace opening, it will stand out in all its heavy grandeur of mahogany or oak-carved moulding as a piece of furniture rather than a decorative feature belonging to the wall. It is often bought obviously to match the furniture of the room, and the sensitive eye will appreciate no satisfying support to this aggressive feature, unless it be the heavy skirting at the base. Many an old room with a simple deal chimneypiece and a studied proportion of dado and architrave moulding has been infinitely better decorated than many modern rooms furnished in the most sumptuous style, but where there has been such complete failure to distinguish between decoration and furniture. All the most beautiful decorations one can recall leave a distinct impression, and in no way compete with the necessary furniture

of the room, but rather seem to emphasise it. Rob most modern rooms of their furniture and what have you left? Ready-made wall-decoration is, generally speaking, an anomaly, and the money spent on such isolated features would, as a rule, cover the expense of a simple treatment of all the wall space. If your rooms are small you are only further reducing their scale by putting up a large and complicated feature on one wall. The very finest effects, as well as the best setting for good pictures and furniture, neither of which can be seen to any advantage in irregular and aggressive surroundings, can always be obtained by simple moulded divisions and plain tints.

The worst offender against all such simple traditional ideas is the person who knows least about architecture—the lady-decorator so-called—the journalistic art-adviser who tells you where to get this or that piece of drapery, wall-paper or covering, with no knowledge of the relative surroundings or architectural features of the room in question. Art is suffering its last indignity from this person—greater even than at the hands of the periodical art faddist, for the advice of this apparently candid friend is calculated with due regard to the wares of enterprising art furnishers.

It is difficult to understand the helplessness of most people on the question of how to furnish their houses and their desire to study some book on the subject. The results of advice sought on the subject of the mere furnishings and trappings of a house must end in failure, or at least be the destruction of individual charm in one's own residence. The lady decorator will offer you the data and arrangement considered up to date, and sufficiently showy to please the majority. On the other hand, the properly designed house will suggest its own simple lines of decoration, and make all genuine useful furniture appropriate. The accessibility of beauty to the majority in these days makes the misuse of such opportunities the more deplorable. To clear the house of all the garbage of useless and ineffective furniture, pots, china, of everything that is confusing and has no inherent value of its own except its uselessness, would be the first step to be taken in most houses. Finally, to wage war against the all-pervading spirit, the chief results of which are symbolised by the showy mantelpiece, to make our rooms less assertive and more restful.

YORKSHIRE ARCHITECTURAL SOCIETY.

THE members of the Yorkshire Architectural Society made their annual excursion to several interesting places in the Kirbymoorside and Lastingham district. The party left York, and were conveyed by rail to Nawton Station, where carriages were in waiting to take them to the quaint old Saxon church at Kirkdale, the features of which were explained by Mr. Geo. Frank. The Kirkdale Cave, close by, was also visited, and afterwards a move was made for Welburn Hall, where Mr. Brierley, the architect for the restoration and rebuilding, acted as cicerone. He explained that the new wing practically occupied the site of an old timber-built manor-house which was left in the twelfth century to the monks of Rievaulx Abbey for the purpose of a retreat. At the dissolution the estate passed to Charles Savile, Duke of Buckingham, and eventually to Sir John Gibson, who built a new stone wing. When Miss Clarke, the present owner, bought the estate four years ago she found the timber-built portion of the house quite beyond restoration or repair, and so decided to rebuild it of stone. The work had been carried out in a most complete and beautiful way, the carved oak panelling of the rooms and galleries and the modelled plaster ceilings being quite unique. Subsequently the visitors drove to Lastingham, through Kirbymoorside and Appleton-le-Moors, and after viewing the Norman church, with its Saxon crypt, returned by way of Hutton-le-Hole, Douthwaite Dale, and Ravenswick. The party dined at the King's Head Hotel, Kirbymoorside. The Rev. W. Haworth, treasurer, presided, and gave a short account of the history and objects of the society, pointing out especially that its work was to assist the study of ecclesiastical architecture and to promote a keen interest in the ancient and historic buildings with which the county so plentifully abounded.

On the proposition of the hon. secretary (Mr. G. H. Fowler-Jones), the following new members were elected:—The Archbishop of York, the Revs. R. G. Fish, Castle Howard Rectory, H. E. Ketchley, Barton-le-street, G. H. Lightfoot, Pickering, and J. A. Salmon, Lastingham; and Messrs. H. Copperthwaite, E. R. Dodsworth, J. Nelson, H. V. Scott, and G. Teesdale, all of York. A vote of thanks was accorded to Miss Clarke for her kindness in permitting the party to visit the mansion at Welburn, on the motion of Mr. H. Copperthwaite, seconded by Mr. G. N. Fowler-Jones. The return journey was made *via* Pickering and Malton, and through the courtesy of the North-Eastern Railway, in allowing the visitors to travel by the express from Whitby, they were enabled to see the interesting frescoes in Pickering Church, which were described by the rector, the Rev. G. H. Lightfoot.

THE TRUE PRINCIPLES OF POINTED OR CHRISTIAN ARCHITECTURE.

By A. WELBY PUGIN.

(Continued from page 29.)

On Metal-work.

WE now come to the consideration of works in metal, and I shall be able to show that the same principles of suiting the design to the material and decorating construction were strictly adhered to by the artists of the Middle Ages in all their productions in metal, whether precious or common.

In the first place, hinges, locks, bolts, nails, &c., which are always concealed in modern designs, were rendered in Pointed

Hinges of this kind are not only beautiful in design, but they are practically good. We all know that on the principle of a lever a door may be easily torn off its modern hinges by a strain applied at its outward edge (fig. 2). This could not be the case with the ancient hinges, which extended the whole width of the door, and were bolted through in various places. In barn-doors and gates these hinges are still used, although devoid of any elegance of form; but they have been most

PLATE III.—Metal-work.

architecture rich and beautiful decorations; and this not only in the doors and fittings of buildings, but in cabinets and small articles of furniture.

The early hinges covered the whole face of the doors with varied and flowing scroll-work. Of this description are those of Notre Dame at Paris, St. Elizabeth's Church at Marburg, the western doors of Lichfield Cathedral, the chapter-house at York, and hundreds of other churches, both in England and on the Continent (plate III., figs. 1 and 3).

religiously banished from public edifices as unsightly, merely on account of our present race of artists not exercising the same ingenuity as those of ancient times in rendering the useful a vehicle for the beautiful; the same remarks will apply to locks that are now concealed and let into the styles of doors, which are often more than half cut away to receive them (plate III., fig. 4).

A lock was a subject on which the ancient smiths delighted to exercise the utmost resources of their art. The locks of

chests were generally of a most elaborate and beautiful description. A splendid example of an old lock still remains at Beddington Manor House, Surrey, and is engraved in my father's work of examples. In churches we not unfrequently find locks adorned with sacred subjects chased on them, with the most ingenious mechanical contrivances for concealing the key-hole. Keys were also highly ornamented with appropriate decorations, referring to the locks to which they belonged, and even the wards turned into beautiful devices and initial letters (plate III., fig. 5).

In all the ancient ornamental ironwork we may discern a peculiar manner of execution, admirably suited to the material,

Large tracery was either formed of round iron, like a stem twisted into intersections, or of flat iron bars of different thicknesses rivetted together, and the edges chamfered by filing.

Railings were not casts of meagre stone tracery (plate IV., fig. 4), but elegant combinations of metal bars, adjusted with due regard to strength and resistance (fig. 5).*

There are many fine specimens of this style of railing round tombs, and Westminster Abbey was rich in such examples, but they were actually pulled down and sold for old iron by the order of the then Dean, and even the exquisite scroll-work belonging to the tomb of Queen Eleanor, of which I have here given a specimen (fig. 6), was not respected. The iron screen

PLATE IV.—Metal-work.

and quite distinct from that of stone or wood. For instance, tracery was produced by different thicknesses of pierced plates laid over each other (plate III., fig. 6, Nos. 1 to 4).

Leaves and crockets were not carved or modelled and then cast, but cut out of thin metal plate, and twisted up with pliers (plate IV., figs 1, 2), and the lines of stems either engraved or soldered on. By these simple means all the lightness, ease and sharpness of real vegetation is produced at a much less cost than the heavy flat foliage usually cast and chased up. It is likewise to be remarked that the necessary fastenings for ironwork were always shown and ornamented. Bolts, nails and rivets, so far from being unsightly, are beautiful studs and busy enrichments if properly treated (fig 3).

of King Edward IV.'s tomb at St. George's Chapel, Windsor is a splendid example of ancient ironwork.

The fire-dogs, or andirons (fig. 7), as they were called, which supported either the fuel-logs where wood was burnt, or grates for coal, were frequently of splendid design. The ornaments were generally heraldic, and it was not unusual to work the finer parts in brass for relief of colour and richness of effect.

These form a striking contrast with the inconsistencies of modern grates, which are not unfrequently made to represent diminutive fronts of castellated or ecclesiastical buildings with

* The parts with a + in this figure are merely pierced out of thin plate, and rivetted to the bars.

turrets, loopholes, windows and doorways, all in a space of 40 inches (see figure below).

The fender is a sort of embattled parapet, with a lodge-gate at each end; the end of the poker is a sharp-pointed finial, and at the summit of the tongs is a saint. It is impossible to enumerate half the absurdities of modern metal-workers; but all these proceed from the false notion of disguising instead of

Well at Antwerp.

Iron Tracery.

beautifying articles of utility. How many objects of ordinary use are rendered monstrous and ridiculous simply because the artist, instead of seeking the most convenient form and then decorating it, has embodied some extravagance to conceal the

Pseudo-Gothic Grate.

real purpose for which the article has been made. If a clock is required it is not unusual to cast a Roman warrior in a flying chariot, round one of the wheels of which, on close inspection, the hours may be described; or the whole front of a cathedral

church reduced to a few inches in height, with the clock-face occupying the position of a magnificent rose window. Surely the inventor of this patent clock-case could never have reflected that according to the scale on which the edifice was reduced his clock would be about 200 feet in circumference, and that such a monster of a dial would crush the proportions of almost any building that could be raised. But this is nothing when compared to what we see continually produced from those inexhaustible mines of bad taste, Birmingham and Sheffield; staircase turrets for inkstands, monumental crosses for light-shades, gable ends hung on handles for door porters, and four

Pseudo-Gothic Metal-work.

doorways and a cluster of pillars to support a French lamp; while a pair of pinnacles supporting an arch is called a Gothic-pattern scraper, and a wiry compound of quatrefoils and fan tracery an abbey garden-seat (see above). Neither relative scale, form, purpose nor unity of style is ever considered by those who design these abominations; if they only

Pattern of Modern Gothic Paper.

introduce a quatrefoil or an acute arch, be the outline and style of the article ever so modern and debased, it is at once denominated and sold as Gothic.

While I am on this topic it may not be amiss to mention some other absurdities which may not be out of place, although they do not belong to metal-work. I will commence with

what are termed Gothic-pattern papers, for hanging walls, where a wretched caricature of a Pointed building is repeated from the skirting to the cornice in glorious confusion—door over pinnacle and pinnacle over door. This is a great favourite with hotel and tavern-keepers. Again, those papers which are shaded are defective in principle; for, as a paper is hung round a room, the ornament must frequently be shadowed on the light side.

The variety of these miserable patterns is quite surprising, and as the expense of cutting a block for a bad figure is equal if not greater than for a good one, there is not the shadow of an excuse for their continual reproduction. A moment's reflection must show the extreme absurdity of repeating a perspective over a large surface with some hundred different points of sight; a panel or wall may be enriched and decorated

Ancient Pattern for a Flock Paper.

at pleasure, but it should always be treated in a consistent manner.

Flock papers are admirable substitutes for the ancient hangings, but then they must consist of a pattern without shadow, with the forms relieved by the introduction of harmonious colours. Illuminated manuscripts of the thirteenth, fourteenth and fifteenth centuries would furnish an immense number of exquisite designs for this purpose.

These observations will apply to modern carpets, the patterns of which are generally shaded. Nothing can be more ridiculous than an apparently reversed groining to walk upon, or highly relieved foliage and perforated tracery for the decoration of a floor.

(To be continued.)

OXFORD ARCHITECTURAL SOCIETY.

THE members of this Society have just paid a visit to Southampton and district. At Porchester, the vicar, Rev. J. Vaughan, met them at the castle and gave an account of the church, which is situated within the castle enclosure. In the year 1133 Henry I. founded a monastery for Augustine canons to pray for the souls of his father William and his brother Rufus. The main fabric of the present church was built at this date, but the more elaborate carving of the west front and the arch, formerly opening into an apsidal chapel on the east face of the north transept, were probably later, and belonged as was suggested by the Sagittarius on the west door to the reign of Stephen. The font with its intricate arcading and interlacing work was also of the same date. Mr. Vaughan pointed out the corbels of the cloister roof beneath the lofty windows on the south of the nave and the rough patching at the west end of the nave where the conventual buildings on the west of the cloisters had abutted on the nave. The cloister square had formerly reached southwards to the castle wall, which may have bounded its southern side. Within twenty years of the foundation the canons migrated to Southwick, about three miles off, beyond Portsdown, probably, as was suggested, owing to the turbulence inseparable from an important castle in Stephen's reign. After this date the church had little or no recorded history, but several points could be elucidated from the structure itself. Apparently in Elizabethan times, as was

shown by the debased Perpendicular windows, the south transept was pulled down, the arch into the tower blocked up and the chancel was much shortened and lowered in pitch. Sundry repairs were carried out by Queen Anne which were recorded on a board with the royal arms on the north side of the nave. During the great French war the prisoners were employed in painting the square pews a deep blue colour; these pews were swept away within the last few years.

Mr. J. Parker, president of the Society, said that he doubted whether the church was actually built as early as 1133. Money was usually allowed to accumulate for several years after the so-called foundation, in order to prepare for building operations. As regarding the charter of foundation, the original was not in existence, but was only to be found in an "inspeximus" of 1269. The king was not really the founder, but only gave leave to others to leave money for the purpose, for which permission he got a handsome payment. It was curious that in the charter there was no mention at all of the castle, a mention which would certainly have been expected in the case of a church within a castle enclosure. The cathedral at Old Sarum was an instance in point. The question then arose whether the castle enclosure was in existence in 1133, and the structural evidence of the castle wall only served to throw additional doubt on its existence. The migration of the canons to Southwick might be placed between 1149 and 1153, for in grants by Pope Eugenius, who ruled between those dates, the change could be noted. From the Taxatio Papæ Nicholai of 1291 it was certain that the church was then independent of any monastery. The inference was that it had become a parish church after the canons' departure. If so the lord of the castle would be its patron, and would naturally look after its structure. It was therefore possible that the west front and other elaborate work had been built or enriched, after the canons' migration, in the reign of Henry II.

A discussion then took place on several doubtful points; as to the meaning of the two blocked arches at the south-east angle of the nave, which are only visible from the inside, the general opinion seemed to be that one, at any rate, was an entrance into the church from the cloisters. The vertical grooves visible above the string-course on each side of the nave, between the first and second windows to the west, from the tower arch, received no explanation. Another point of interest was the small square-headed window at the north-east angle of the nave, and the marks of a lean-to roof on the outside wall over it. A porch to the door in the north transept, or an anchorite's cell in the angle between nave and transept, were suggested as possible explanations.

On the south side of the nave, at the west end, Mr. Parker pointed out the springing of a barrel vault, which had carried part of the conventual building on the west side of the cloister.

The Norman castle occupies the north-west angle of the square enclosure, whose supposed Roman origin has been the cause of so much dispute among antiquaries. The long flights of steps leading up to the keep were climbed, and Mr. Parker gave an account of the history on the roof of the keep. He said that there were three possible derivations for the name Portchester: 1, from the Latin *portus*, harbour, and hence the camp on the harbour; 2, from Anglo-Saxon port-town—hence the camp, the town; 3, in the Anglo-Saxon Chronicle several raids of the Saxons are recorded at the end of the fifth century. In 495 Cerdic and Cynrig landed at Cerdicsore (perhaps Charmouth); in 501 Port and his sons landed at Portsume, which is generally supposed to be Portsmouth; possibly, as the Chronicle hints, Port gave his name to the "chester" which he found standing, but more probably the legend was invented to account for the name. Nennius in the ninth century gives Caer Peris among the Romano-British cities, and this Henry of Huntingdon in the twelfth century identifies as Porchester. The name Port occurs in the Anglo-Saxon Chronicle, but may refer to Portland in some cases. The name Port-ceaster is found in the Winchester Chartulary under the year 904, in an exchange of land between Edward the Elder and the Bishop of Winchester. Here it is described as a "ville." In a confirmation of the above by Eadgar in 960 Port-ceaster is called an "oppidum." Possibly this change of description may mean that Edgar had fortified it among the other military works of his reign. The present keep seems to have been built in the latter half of the twelfth century, but no records can be found to fix the exact date. King John was here very often during his reign. Nothing, however, besides the keep remains of the early building contemporary with the keep, except possibly fragments in the foundations of some of the buildings round the inner courtyard. In 1220 payments were made for "strengthening the castle," but of this date no remains exist. In 1264, after the battle of Lewes, Simon de Montfort gave the castle into the hands of his son, Simon the Younger, to guard against an invasion projected by the queen of Henry III. In the year 1274 Edward I. issued a commission for examining the castle and the report was that it was old and ruinous. Evidently after this date the whole of the inner court was rebuilt as its style shows, along with the land port or western

gate. Subsequent changes, notably in the reigns of Richard II. and Elizabeth, have left the inner court in its present state. About the walls of the outer square enclosure much discussion took place, Mr. Vaughan pointing out that they resembled the walls of Silchester in which similar bonding-stones of green sand are used, and Mr. Parker commenting on the absence of many Roman features, such as the pounded brick in the mortar and the want of bonding courses of tiles regularly laid. In either case the evidence seemed inconclusive.

From Netley Station the party walked to the ruins, a distance of about three-quarters of a mile. The ruins consist of the conventual church, which has a choir with north and south aisles, transepts with eastern aisles (the north transept has entirely disappeared above the foundations), and a nave with north and south aisles; to the south of the nave is the cloister court, with ranges of buildings on its east, south, and part of its west side, and to the east of the cloister court is a garden or court with its small isolated building at its east end. Assembling in the choir, the members were met by Mr. Dale, of the Hants Field Club, who had kindly offered his services in conducting the party over the ruins. Before inspecting the buildings, Mr. Parker gave a short account of the history of Netley and its abbey. The first mention of Netley was to be found, like that of Portchester, in the Anglo-Saxon Chronicle. Soon after the Saxon raid at Portsmouth in 501, the Chronicle says that Cerdic and Cynrig landed and slew a British king called Natanleag, who gave his name to the place of his death. But the doubtful character of this derivation is intensified when we find that the name Netley does not occur in early documents. The ancient parish in which it was included was Hune, now Hound. The foundation charter of 1239 gives the name as Letteley. It seems likely, therefore, that the difficulty of pronouncing Letteley caused the gradual change of "l" to "n," and that the story of the Anglo-Saxon Chronicle was invented to account for the name. In the year 1239, as given in an "inspeximus" of 1252, Henry III. granted leave to the monks of St. Edwardstowe to found an abbey at Letteley. The explanation of this was given in the annals of Waverley Abbey, which was the earliest Cistercian house in Britain, and whose annals were therefore peculiarly valuable for the history of the Cistercian Order. It appeared that Peter des Roches, Bishop of Winchester, had intended to found two houses for Cistercian monks. His death in 1238 balked him of his wish, but he left certain sums of money to his executors for the purpose. The result was that a Cistercian abbey was founded at St. Edwardstowe and filled with monks from Beaulieu Abbey. The dedication of the new abbey to Edward the Confessor explained the name of Edwardstowe. Mr. Parker then turned to the architecture of the church and conventual buildings. The church was all, practically speaking, of one date and of one design. The choir and transepts were rather earlier than the rest of the building, and were evidently begun soon after the foundation in 1239. The windows of choir and transepts are plain double lancets under one arch, with no piercing in the head. The south aisle seems to have been built next in order, as the windows, which are triple lancets under one arch, have the centre arch foliated. The north aisle was the next in date, the triple lancet windows having developed into what is practically one three-light window with tracery. All through the nave, however, the mouldings and general disposition were the same. The west window was a few years later than the rest of the building, having had regular Geometrical tracery. There was some difference of opinion as to the east window of the choir, which is of four lights, with an eight-foiled circle in the head; it had probably, however, been left unfinished till after the choir and side-walls of the nave were completed, as its more ornate style indicated. The conventual buildings were next commented upon. The upper storeys being gone, there was considerable difficulty in assigning to each building its proper use. The slype, which usually interposed between the south side of the south transept and the chapter-house, was wanting in this case, and its place was taken by a narrow room which seemed from its piscina and aumbry to have been a sacristy. To the south of this was the chapter-house, with the usual arcade in its west front, opening on the cloister. South of the chapter-house was the slype leading from the cloister to the court or garden mentioned as lying east of the cloister. South of the slype was a long room—the last on the east side of the cloister—which had been the subject of much doubt. It had usually been called the refectory, and the two rooms running at right angles to its southern end, respectively the buttery and kitchen. The discovery in 1893 of the foundations of a long building running south at right angles from the south side of the cloister makes it probable that these foundations belong to the refectory, which would then occupy the same place as at Beaulieu, the mother abbey, and the so-called refectory must be the monks' day-room. Over the sacristy, chapter-house, slype and the long room just mentioned ran the dormitory, several of the cubicle windows, though blocked up, being visible in its west wall. From the north end of the dormitory a stair ran down into the south-west angle of

the south transept, where was once a newel-stair, whose bonding into the transept wall was still to be seen. Access from the dormitory to the choir was possible through the clerestory of the transept, and down a newel-stair at the south-west angle of the choir. The same means of communication between dormitory and church is also to be seen at Beaulieu Abbey. As to the so-called kitchen and buttery, to the south of the long room, authorities differ. Some, on the ground that the main drain runs right under them, and that the fireplace is not suited for the purposes of cooking, would call them the garderobe and calefactory. Others called the larger room the guest-house, and the smaller, a buttery adjoining a kitchen, which once existed between it and the foundations recently discovered. It has also been suggested that it is the abbot's lodging. In the south wall of the cloister are visible the remains of the lavatory, under a series of shallow blank arches. South of this wall is a range of post-reformation buildings, put up by the lay owners to whom the abbey was granted, under which range the foundations were discovered. At the south-west corner of the cloister is a building, most likely the guest-house. This had, in accordance with the strict rule of the Cistercians, to be in a position cut off from the other abbey buildings. This building had only one small door opening on the cloister.

Beyond the garden which lies east of the cloister is an isolated building which was almost certainly the infirmary, though some had called it the abbot's lodging. Its isolated position made it peculiarly suited for an infirmary.

NATIONAL TRUSTEESHIP OF HISTORIC PLACES.

ON Monday evening a meeting was held in the Rubens Room of Grosvenor House, with the view of establishing a National Trust for Places of Historic Interest or Natural Beauty. The chair was occupied by the Duke of Westminster, and there was a good attendance. Among the provisional council are Lord Rosebery, the Dukes of Devonshire and Westminster, the Marquesses of Dufferin and Ripon, Mr. Shaw Lefevre, M.P., Mr. Leonard Courtney, M.P., Professor Huxley, Sir Frederic Leighton, Sir George Reid, the Masters of Trinity and Balliol, the President of Magdalen College (Oxford), the Provost of Eton, Mr. Holman Hunt, Mr. G. F. Watts, Mr. Alfred Waterhouse and other Royal Academicians, Mr. Walter Besant, Mrs. Fawcett, Mrs. Humphry Ward, Miss Harriott Yorke and Miss Octavia Hill. Among those present were:—The Earl of Stamford, Sir Frederick Pollock, the Earl of Carlisle, Professor Max Müller, Sir Robert Hunter, Mr. E. J. Poynter, R.A., Mr. D'Arcy Collyer, Mr. Pembroke Stephens and others. Letters of apology for absence, expressing sympathy with the objects of the meeting, were read from the Earl of Rosebery, the Marquess of Ripon, the Earl of Winchelsea, the Provost of Eton, the Master of Balliol, the Master of the Temple, Lord Meath, Lord Thring, Sir A. Blanford, Mr. A. Waterhouse, Sir Frederic Leighton, Mr. J. Bryce, M.P., Professor Dowden, Mr. H. Acland, M.P., Mrs. Henry Fawcett, Colonel Scott-Moncrieff and Mrs. Humphry Ward. Mr. G. F. Watts, R.A., wrote:—"The objects of the National Trust Society I fully appreciate and hope to see carried out. The world is too much with us, we are too apt to see only what happens to be of material importance, not always so valuable as it seems to be. I think it cannot be doubted that providing for the needs, interests and pleasures of those who are coming after us we should exercise the minds not only of statesmen, but of every one who has the well-being of the nation at heart. The wisest laws and the firmest enforcement of them will be powerless to remove discontent or cope with the consequences of it. Trades unions must be supplemented, for they cannot be put down, by unions among the thoughtful to promote pleasure and contentment. To keep alive interest in the history of the country is not one of the least happy of the means to be employed. I should be glad to co-operate with the Society by hearty personal activity, but from the uncertainty of the state of my health and want of time I am unable to undertake any kind of work outside my studio."

The Rev. Canon Rawnsley said the object of the proposed Association was to promote the preservation of places which were of value to the nation, either from their natural beauty, from their historic associations, from the means of education or recreation which they afforded, or from any other cause. The owners of such spots would often be willing to secure them to the public use on certain conditions, if there existed some simple means of giving effect to their wishes. They were not, however, always ready to make such places over to a local authority, nor was such authority always in a position to accept and manage them, while there was no other body in existence which was capable of holding land for purposes of public enjoyment. The precise conditions of the trust would depend partly upon the wishes of the donor, and partly upon the

character of the property. In continental cities it was not uncommon to find the houses of celebrated persons open to view on payment of a small fee, e.g. Albert Dürer's house at Nuremberg. Again, there might be cases in which an owner of property, while not prepared to dedicate it to the public, or even to admit the public to its enjoyment, would be very willing to prevent its conversion into a building estate (such a case as that of Holland House would occur to Londoners), if he could establish in perpetuity a legal restraint upon its use, and thus give the public a modified interest in it. Such an arrangement might probably be made with the proposed Association, which, being a corporate body, might be made the depositary of reversionary interests and covenants, enforceable at any time for the purpose of keeping the land *in statu quo*, or, if necessary, special statutory power for such a purpose might be obtained, as in the case of prehistoric monuments. The Association aimed at nothing more than supplying means for giving effect to the wishes of landowners, though no doubt its very existence might act as an incentive to generosity. In the first instance it could hardly expect to be more than the recipient of gifts—a lady had already expressed her desire to make over to the Association a beautiful sea-cliff on the west coast of Wales. But if its objects and mode of action found favour with the public, it would probably in time accumulate funds through gift, bequest or otherwise, which would enable it to purchase places of special beauty or interest as opportunity served, and in other cases funds might be raised for particular purposes. It was notorious that during the last two years the top of Snowdon, the island in the middle of Grasmere Lake, and the Lodore Falls have come into the market. Had such a trust as that now proposed been in existence, each of these places might have been obtained for the nation. If such an Association as that projected should acquire considerable property, it might be desirable to give it the authority of a Royal Charter or special Act of Parliament. But, in the first instance, the Association would be incorporated under the Joint Stock Companies Acts, with the license of the Board of Trade to dispense with the use of the word "limited." It was an essential condition of this license that no profit be made by the members of the Association, and that the property of the Association, in the event of dissolution, be not realised for the benefit of the members, but made over to such other body with similar aims as the members might choose or a court of law might direct. These conditions were also essential, in a case like the present, to give the public confidence in the Association.

Several resolutions in support of the objects of the Association having been passed, the proceedings terminated.

THE BETTERMENT SCHEME.

THE select committee of the House of Lords appointed to consider and report whether, in the case of improvements sanctioned by Parliament and effected by the expenditure of public funds, persons, the value of whose property is clearly increased by an improvement, can be equitably required to contribute to the cost of the improvements, have made the following report:—

1. The committee have taken evidence from the promoters of several Bills which have contained provisions for imposing what has been called a betterment charge in respect of improvements effected by local authorities.

2. They have also had before them witnesses who have had experience of the actual working of betterment charges in various forms, and they have taken the evidence of other experienced witnesses and of gentlemen who have written upon the subject.

3. They have made known their willingness to hear any evidence that any municipal body or local authority might be disposed to lay before them. The committee, having fully considered the evidence taken before them, have come to the following conclusions, viz.:—

(1) The principle of betterment—in other words, the principle that persons whose property has clearly been increased in market value by an improvement effected by local authorities should specially contribute to the cost of the improvement—is not in itself unjust, and such persons can equitably be required to do so. But the effect of a public work in raising the value of neighbouring lands is shown by experience to be uncertain. Whether in any particular case it is possible for a valuer to pronounce that such an effect has been produced by the completion of any public work is a point upon which the evidence of eminent valuers differs greatly.

(2) The Standing Orders should be amended so that in any case where a private Bill renders any property liable to a special charge on the ground that its market value will be increased by the completion of a public work, the owners of such property, or of any interest therein, shall be entitled to notice before the introduction of the Bill, in like manner as if the property were to be compulsorily purchased.

(3) It should be provided in the Bill that, within some reasonable period after the completion of the work, the owner of the property intended to be charged should receive notice of the amount of the charge which the local authority proposes to make in respect of the alleged increase in the market value of the property due to the work in question. Inasmuch as the appropriateness of the period must, to some extent, depend upon the nature of the work and the condition of the neighbourhood, it would be difficult to fix any definite time applicable to all cases, but these considerations should be borne in mind by the committee to which the Bill is referred. The period should not be so short that the effect of the improvement could not be adequately tested, and it should not be so long as to make the property intended to be charged suffer in its market value by the suspension of the decision as to the charge.

(4) In default of acquiescence by the person on whom notice is served, the amount of the charge to be made should be decided by an arbitrator, unless the said person claims to go before a jury, and the decision should be taken with as little delay as possible.

(5) All the costs of such arbitration or inquiry before a jury should be borne by the local authority claiming to lay such charge, unless the arbitrator or jury shall find or award the same sum or a greater sum than that which the local authority sought to lay upon the property, in which case each party shall bear his own costs incident to the arbitration or inquiry, and the costs of the arbitrator or jury shall be borne by each of the parties in equal proportions; unless it should be otherwise ordered by the arbitrators, or in the case of a jury by the High Court upon the ground that the opposition to the proposed charge has been frivolous and vexatious.

(6) If the owner has property in the immediate neighbourhood which is found to be injured in its market value by the same work, the amount of the injury should be considered in determining the charge to be imposed upon him for improvements.

(7) If the owner is of opinion that the charge exceeds the enhancement of market value due to the public work, he should be entitled to claim that the local authority should purchase the property in question at the value which it bore, without regard to any improvement conferred or to be conferred upon it by such work, but under such circumstances a local authority purchasing a freehold or long leasehold should not be compellable to dispossess the occupying tenants, and should, if they prefer it, be empowered to purchase the reversion, subject to any intermediate interests.

(8) If any question should arise as to the incidence of the betterment charge between any of the persons entitled to different interests in the same property charged, the question should be determined by arbitration.

(9) Various witnesses have illustrated their opinions by reference to the Bills now before Parliament, but the committee (to which these Bills have not been referred) has formed no opinion on the merits of either of the Bills in question, but inasmuch as the provision as to notices in paragraph (2) is inapplicable to the Bills already introduced, the committee consider that it ought to suffice if the select committee to which the Bills in question are to be referred should be satisfied that adequate notice has been given to all persons who may be affected by the proposed process of charging.

(10) The committee have received evidence upon what has been called "recoupment;" that is to say, powers given to a municipal or other public body to take land beyond what is necessary for the actual execution of the work, so that some part at least of the improved value may be secured by the improving public body in ease of the burden upon the ratepayers. Some evidence was given by persons who had actual experience of the operation of such a system, the general effect of which was that it had not proved successful; but the committee are not satisfied that it has ever been tried under circumstances calculated to make it successful, inasmuch as no sufficient power has ever yet been given to local authorities to become possessed of the improved properties without buying out all the trade interests, a course which is inevitably attended with wasteful and extravagant expenditure.

PRESERVATION OF LANDSCAPES.

ON Friday last Mr. Alfred Waterhouse, R.A., presided at the second annual meeting of the National Society for Checking the Abuses of Public Advertising. Sir Frederic Leighton, who was unable to be present, wrote:—"I am glad of this opportunity of assuring you in writing of my entire sympathy with the spirit which animates your Society. No-body can resent more warmly than I do the vulgar bluntness of feeling which leads men to deface, or to lend themselves to the defacing of, the charms of rural scenery with staring advertisements. I include those who lend themselves to this barbarism; for the tradesman who pushes in this manner his

pill, his plaster, or his nostrum is not more blameworthy, but indeed less, than he who hires out his meadow or his coppice for such a purpose, and earns a pittance at the cost of so much offence. Never more than in our overridden days was the soothing, restful atmosphere that breathes from natural scenery precious, needed. Never less than now can we afford to see its sweet silences invaded by these blatant blemishes of the strife of competing druggists and manufacturers, which, when we leave our towns, we would fain for a while forget. You will render good service if you abate this evil custom even a little."

The Chairman urged that every effort must be made to increase the membership of the Society. He was convinced that they had only to make known their aims to obtain for them wide and general acceptance.

Mr. John Richmond, hon. sec., read the annual report, which stated that one class of disfigurement which the Society desired to abate had in reality increased. Nevertheless, the Council believed that progress of a substantial kind had been made towards the ultimate accomplishment of the desired reform. Their efforts had at least made the regulation of spectacular advertising a public question. Two years ago it appeared to many the wildest of dreams to suppose that any serious hearing could be secured for a protest on the subject. They claimed already to have made it one of the recognised problems of the day. The question had been raised in a practical shape in many public bodies; the correspondence in many country newspapers proved that local opinion was not only roused, but was active, while they had obtained from a very large number of the most influential journals positive assurances of sympathy and support. They did not, of course, take any credit for the welcome and most valuable declaration made by Lord Rosebery at the Academy banquet regarding the growing danger to English landscape, but it was hardly presumptuous to believe that the Prime Minister would not have made a public profession of his faith and his fears if they had not done something to prepare the atmosphere for the discussion of the topic as one of grave urgency. They had made the defence of scenery, the protection of the rural picturesque, and respect for the proprieties of the eye in towns distinctly a public question.

Mr. Wyndham, M.P., moved the adoption of the report.

Mr. Fawcett seconded the motion, remarking that unless a check were put upon the growing evil, they might expect to see a sky-sign on Skiddaw and advertisements of pills on the dome of St. Paul's.

On the motion of Mr. E. Wilson, the thanks of the meeting were tendered the Earl of Rosebery for his having drawn public attention to the growing evil of advertising disfigurement, and to members of Parliament, municipal and county councils and the press, for the support given the principles of the Society.

SHEFFIELD TOWN HALL.

ON Monday, by invitation of Mr. E. W. Mountford, president of the Architectural Association, the members of the Sheffield Society of Architects and Surveyors met to be shown over the building. The plans and details were thoroughly explained as well as the materials and the manner of using them, and the descriptions were listened to with great attention and interest. There was a large number of visitors, who were divided into parties and conducted over the building respectively by Mr. Mountford, the architect; Mr. Scales, the clerk of works; and Mr. Robson, the contractor's manager. Many questions were asked and freely answered, and the various arrangements and details of the building were highly commended. A sample of one of the inside doors which had been set up in oak attracted considerable attention, and the hope was expressed on all hands that the City Council would adopt it and the other items suggested for the permanent improvement of this building, which should be a credit to the city. It would be a source of regret afterwards to find that for the sake of false economy this fine building had been spoilt for a comparatively insignificant saving. Mr. C. J. Innocent, hon. secretary, proposed that the thanks of the members present be tendered to Mr. Mountford and his staff for the kind and free manner in which the building and plans had been opened for the inspection of the members. The motion was seconded by Mr. Joseph Smith, a member of the council of the Society, who said he had been most interested in the building, and that he very sincerely hoped our city fathers would in their wisdom decide to adopt these few "extras," which for their effect in the building would be worth all they might cost. The vote was carried with acclamation; and Mr. Mountford, in responding, said it had been a very pleasant occasion to him. With respect to the items which he had suggested for the internal finishing of the building, it had been stated as a reason for not adopting them that to do so would be unfair to the other architects who competed, but he had heard to-day, from Mr. Gibbs and others, that such was not the view of the architects of Sheffield, and

indeed he would have been the last man to have proposed anything that would be unfair to the other competitors. He was glad to have heard the expressions of satisfaction with his work, and he could, at any rate, say of the building that it was thoroughly British, from the steel of the joists to the marble decoration of the walls. When the building was further advanced he would be pleased to invite the Society again to look over it, and place himself at their service.

Operations are now proceeding rapidly. The Surrey and Norfolk Street portions are nearly complete, so far as the outer work is concerned, very satisfactory progress is being made with the council-chamber section, and the erection of the front in Pinstone Street, where nothing has been done for a considerable time, is to be at once resumed. The contractor has now about two hundred men engaged, and of these about eighty are masons. The work has been retarded in consequence of the scarcity of masons. At no time have the services of a sufficient number been obtainable, but the contractor now hopes that the Surrey Street part of the building will be finished by the end of the year. Everything inside is, of course, in a rough state at the present time, but the opportunity of seeing the work as far as it has gone was gladly seized by many members of the Society.

GENERAL.

The Late Sir Henry Layard, it is stated, has bequeathed to the National Gallery a selection of the most valuable of his pictures, the gift to take effect on the death of his wife.

Excavations are being made in the precincts of Peterborough Cathedral, by permission of the dean and chapter, with a view to tracing any existing remains of the original Saxon monastery which stood on the site of the present cathedral. A portion of the old Saxon church was discovered under the pavement of the south transept during the restoration of the centre tower of the cathedral.

Mr. A. Smith-Woodward, of the British Museum, has been elected president of the Malton Naturalists' Society, in succession to Professor Miall, of the Yorkshire College. An excursion to Rosedale is being organised for August 8.

Mr. Mellor, formerly assistant surveyor, has been appointed borough surveyor and engineer for Tunbridge Wells, in succession to the late Mr. Brenthnall.

The Additions to York Cottage, Sandringham, which Colonel Edis is carrying out, are almost complete. They comprise several bedrooms and nurseries.

M. Jules Saintin, the French portraitist and painter of *genre* subjects, has died in Paris in his sixty-fourth year.

The Burgomaster of Haarlem has become president of the committee that has undertaken the erection of a memorial of Frank Hals, the painter, who, although a native of Malines, lived in Haarlem during many years, and died there in 1666.

M. Antonin Proust, who was the French Minister of Fine Arts a few years ago, has become the critic for music on the *Matin*.

The Manchester Field Naturalists lately made an excursion to Hathersage, where the vicar, Rev. C. Cutler, conducted the party through the church (which is a good example of the Late Decorated period), possessing several altar-tombs and monumental brasses of local celebrities, including one of Robert Eyre, who fought at Agincourt; in the churchyard is the reputed grave of Little John, Robin Hood's henchman. The vicar also pointed out the remains of an ancient earthwork known as Camp Green, close to the church, and which is of Danish or British construction.

The Summer Exhibition of pictures just opened at the York Corporation Art Gallery, with the works in the permanent collections, comprises upwards of 1,000 modern paintings, drawings in water-colours, black and white and paintings on china.

The Hope Trustees, having considered the report of Mr. Ewan Christian, the assessing architect, on the competitive plans for the Thomas Hope Hospital, to be erected at Langholm, have selected the design sent in by Mr. Woodd, New Bond Street, London. They have also resolved to proceed at once with building the hospital. The competing architects included gentlemen belonging to Edinburgh, Glasgow, London and Carlisle.

The Handsworth School Board have agreed to purchase a site in the Birchfield Road for the purpose of erecting new schools at a cost of 1,800*l.*, also to invite certain architects to send in competitive plans.

The "Nottingham Guardian" says the Corporation of Nottingham, through their castle museum committee, have authorised the art director, Mr. G. Harry Wallis, to form an exhibition of the works of Cornish painters in the autumn.

The Architect.

THE WEEK.

LITIGATION is expensive, but everyone who has a professional interest in the valuation of buildings will be anxious to have the decision of one of the higher Courts on a case which has arisen in Liverpool. The Grand Theatre has been used for the past year as a warehouse. In such a case is the former or the present use to determine the valuation? The Corporation insist on rates which are assessed on the supposition that the building was and can still be used as a theatre. According to the Act of 1864 rates are to be based on "the rent at which the hereditament might reasonably be expected to let from year to year," which is almost identical with the language of 6 & 7 Will. IV. c. 96. The Metropolitan Valuation Act of 1869 defines value as "the annual rent which a tenant might reasonably be expected, taking one year with another, to pay for an hereditament." Now it is not likely that a theatre would be used as a warehouse unless it was considered that such a use was preferable to leaving the building idle. The magistrates, who have twice heard the case, considered that the building should be accepted as a warehouse and rated accordingly, but the Corporation maintain it is a theatre, and accordingly have resolved to carry the case to other courts.

THE Congress of the British Institute of Public Health was opened on Wednesday evening by a conversazione at King's College. The proceedings in the Section of Engineering and Building Construction, of which Professor BANISTER FLETCHER is president, began on Thursday, and will be continued to-day and on Monday next. The subjects for discussion are the following:—"Sanitation of Flats," "A System of Softening Public Water Supplies," "Electric Lighting as a Health Agent," "The Destruction of Town Refuse," "Sewage Effluents," "Artisans' Dwellings," "The Planning of Fever Hospitals," "The Architectural Features of Elementary Schools from a Public Health Point of View," "The Eastwood and Greasley (Nottingham) Drainage Works," "A London Architect's Troubles with the Local Sanitary Authorities," "Electric Light, Power and Heating." There will be a small exhibition of plans of hospitals and asylums, and drawings illustrating schemes of sanitation which have recently been carried out.

THE select committee to whom the London Streets and Buildings Bill was referred have agreed to the following report:—1. That a report from the Home Office had been considered by the committee, and that they had adopted such of the recommendations therein contained as appeared applicable to the case as submitted to them. 2. That there are no other circumstances of which, in the opinion of the committee, it is desirable that the House should be informed. 3. That they had examined the allegations contained in the preamble of the Bill, and found the same, as amended, to be true, and had gone through the Bill and made amendments thereunto. The committee also state that they had made further amendments thereto, and had agreed to the following report:—"That a report from the Home Office on the Bill dated April 27, 1894, together with a supplemental report, dated June 13, 1894, were laid before the committee. As regards the clauses referred to in these reports: clauses 139 and 164 were withdrawn by the promoters; clauses 136, 150, 179 and 180 were, in various ways, amended and modified. As regards clause 144: after considering the existing enactments, which will be consolidated or re-enacted under the Bill, the committee were of opinion that this clause might be allowed. That there are no other circumstances of which, in the opinion of the committee, it is desirable that the House should be informed.

THE late EDMOND JEAN BAPTISTE GUILLAUME, who died in Paris on Friday last in his sixty-eighth year, was a type of the highest class among the French official architects. He was born in Valenciennes in 1826, and his townsmen sent him to Paris in his nineteenth year to study architec-

ture in the Ecole des Beaux-Arts. M. GUILLAUME'S success was not immediate. He did not win the Prix de Rome until 1856, when the subject was "An Embassy in Constantinople." After study in Rome he was sent to measure buildings in Asia Minor, and his labours were invaluable in suggesting some of the influences to which the Romans submitted themselves when designing temples. On his return to France he obtained a second-class medal in 1863 for his drawings of the Temple of AUGUSTUS or LUNUS at Ancyra, the sacred city. An opportunity to gain experience in works was given to him by his appointment as an inspector of buildings at the Palais de Justice. M. GUILLAUME gained his first commission in 1864, for he designed the pedestal of the large memorial of the defence of Paris which is seen in the Place Clichy. Afterwards his design was accepted for a palais de justice and hôtel de ville in Cambrai. In 1867 he was appointed first inspector of the palaces at St. Cloud and Malmaison. His name was inscribed on the roll of the Legion of Honour, but he never reached a high grade. Afterwards the care of the palaces of Versailles, the Louvre and the Tuileries was confided to him, and it was his melancholy duty to demolish the walls of the last which had survived the Commune. At the Louvre M. GUILLAUME rendered a valuable service by his exploration of the subterranean part belonging to the early palace. Since 1884 he was professor of the theory of architecture in the Ecole des Beaux-Arts. M. GUILLAUME was a scholarly architect, and many strangers as well as his countrymen must regret his loss, for he was always ready to help students who were studying the buildings entrusted to his charge.

AMONG the resolutions proposed at the meeting of the Church Sanitary Association at Grosvenor House on Thursday were the following:—It is desirable to approach the archbishops and bishops with a view to gaining their co-operation with the Society in its efforts to make known and enforce the hygienic necessity of personal cleanliness, fresh air, pure water, unadulterated food and wholesome dwellings by means of sermons, addresses, popular lectures and sanitary aid committees in the rural deaneries and parishes. It is desirable that the clergy and church-workers in every parish constitute themselves active officers of this Society to teach the laws of health, to promote the circulation of the publications of the National Health Association, the Ladies' Sanitary Association and kindred institutions, and to co-operate with the local medical officer of health, the local sanitary board and similar authorities. The Association was established two years ago and has already rendered service to sanitation.

THE proposal of Lord WEMYSS that the arch on the southern side of St. Paul's, opposite one occupied by the Wellington Monument, should be balanced by the introduction of a similar monument deserves some consideration. NELSON deserves to have as fine a memorial as could be created, and it would be an advantage if an effort were made to surpass STEVENS'S great work by another in honour of the great sailor. It must also be said that in Italian work symmetry is indispensable. A correspondent of the *Times*, in writing on the subject, says:—"We have no warrant for the supposition that, on condition of monumental erections in the building, Sir CHRISTOPHER imagined that they would be, or ought to be, designed in pairs like the paddle-boxes of a steamer. Sir CHRISTOPHER probably noted, and as probably favoured, as artists mostly do, the unbalanced effect of monuments in other cathedrals—say those, for instance, of CROUCHBACK and AYMER DE VALANCE at Westminster, and WILLIAM OF WYKEHAM at Winchester, and well knew that ultimately St. Paul's, as a matter of course, would be subject to like monumental effects. Under Lord WEMYSS'S dictum our cathedral choirs would all be furnished with not one, but two episcopal thrones, for the sake of 'balance.'" The correspondent, it will be observed, bases his argument on Gothic examples, but he forgets that one of the great differences between the Gothic and Classic, or Italian, is that the former may have one-sided effects which are not tolerated in the latter. The bishop's throne is really a case against him, for in the early basilican churches it was placed in the centre.

MR. RUSKIN'S "VERONA," ETC.*

IN the absence of a new and continuous work by Mr. RUSKIN, there cannot be a better substitute than a reprint of compositions by him which hitherto were known only to a few readers. The contents of the volume we have now to introduce are in that position. They consist of three lectures composed in 1870, and two of the chapters which were to have formed part of the series on Church history known as "Our Fathers have told Us." The lecture on "Verona and its Rivers" was delivered at the Royal Institution. "The Story of Arachne" was related before the students of the Woolwich School of Science and Art. The "Tortoise of Ægina" was intended to form the concluding lecture of a course on Greek sculpture, as illustrated by coins. The chapters on "Candida Casa," that is, the White House (Whithorn or Whitherne Abbey on the Solway), and "The Mending the Sieve" (an incident in the life of St. BENEDICT) relate to the history of monasticism, and the latter, it may be mentioned, was used for a reading at the London Institution in 1882. To the majority of readers of English books the whole work will be as novel as it is important.

Mr. RUSKIN's books become interesting not only on account of the knowledge so laboriously acquired, which he imparts in the pages, but also from the perfection with which they express his moods from time to time. He has no fear about being charged with inconsistency, and his frank admissions of changes of opinion must win the sympathies of the majority of his readers, for, if they are thoughtful, they also have had experience of mental transformations. In the pages before us there is much which is evidence of the conviction that a belief in one's own infallibility is not becoming in any man, and it is safe to be in dread of what is called "the boundless possibility of self-deception." Mr. RUSKIN, when writing the chapters, was we presume more subdued than formerly, and his own disappointments made him full of pity for things which at one time would have excited scorn and indignation. He no longer appears desirous to convert or destroy the world with the lightning of Jove himself. In 1870 he bore more resemblance to one of the old missionary monks of whom he wrote, who were happy when they saw slight signs of amelioration in return for all their labours. Some years earlier Mr. RUSKIN was in despair because packets of TURNER'S sketches were preserved in the basement of the National Gallery instead of being displayed in a palace. But a longer experience of the world appears to have convinced him that it is a theatre wherein more woful pageants are, and were always, presented, than were possible in Trafalgar Square. "There are no tragedies," he says in his first lecture, "like the tragedies of Verona under the Gothic and Lombard kings," but in his pages there are at least glimpses of many that are no less impressive.

In all tragedies, from those of ÆSCHYLUS to Punch and Judy, what is involved is power, and in the Verona and other lectures it is plain that Mr. RUSKIN has been meditating over physical as well as moral power, their uses and abuses, until they have become fascinating for him. It seems to us that the key to the contents of the present volume may be found in the passage concerning the locomotive, which he has reprinted *à propos* of some remarks about the mechanical imperfection of animals:—

I cannot express the amazed awe—the crushed humility—with which I sometimes watch a locomotive take its breath at a railway station, and think what work there is in its bars and wheels, and what manner of men they must be who dig brown ironstone out of the ground, and forge it into THAT! What assemblage of accurate and mighty faculties in them; more than fleshly power over melting crag and coiling fire, fettered, and finessed at last into the precision of watchmaking. Titanian hammer strokes, beating, out of lava, these glittering cylinders and timely-respondent valves, and fine-ribbed rods, which touch each other as a serpent writhes, in noiseless gliding and omnipotence of grasp; infinitely complex anatomy of active steel, compared with which the skeleton of a living creature would seem, to a careless observer, clumsy and vile—a mere morbid secretion and phosphatous prop of flesh! What would the men who thought out this—who beat it out, who touched it into the polished calm of power, who set it to its appointed task and triumphantly saw it fulfil this task to the utmost of their will—feel or think about this weak hand of mine, timidly leading a little stain of water-colour, which I cannot

manage, into an imperfect shadow of something else—mere failure in every motion, and endless disappointment. What, I repeat, would these Irondominant Genii think of me? and what ought I to think of them?

Here we see Mr. RUSKIN, in spite of his old aversion to railways, meekly admitting the greatness of the engine, the *bête humaine*, and, as it were, compelling art to bow down before science. But his new respect for power becomes even more manifest when shown in respect of art. Who would have believed at one time that Mr. RUSKIN would place GAINSBOROUGH beside CARPACCIO? Yet in the Verona lecture he says:—"I am not able—no man, unless one of their equals, would be able—to tell you whether there is really more strength in GAINSBOROUGH, who can draw a mouth with an undulating sweep of his pencil, or in CARPACCIO, who will take half an hour at least to do apparently a little more." But a greater concession is made when speaking of BELLINI'S callousness in his eagerness to uphold art for the sake of art, and his indifference whether "people are martyred or not, so long as one can make a pretty grey of their gowns and a nice white of their sleeves and infinite decoration of forest leaves behind." Mr. RUSKIN adds:—"I used to think all this very wrong once, and that it meant general falseness and hardness of art, and so on. It means nothing of the kind. It means only that one's whole soul is put into one's work, and that the entire soul so spent is healthy and happy and cannot vex itself with questions, cares or pains." After this no one will be surprised to find CORREGGIO mentioned as one of the representatives of the highest art.

What is of infinitely more importance to Mr. RUSKIN, as it is to the world, is the phenomena presented by force or power when subjecting itself to the dominion of law. The greatest of all the Titans according to him is THEIA, for "she is the origin of light and harmony; the embodied 'Let there be light' of the heathen world." Accordingly he makes us admire the Lombards of Verona, for they were men of vigorous nature, who intimately realised that force was more effectual when it was disciplined, and took care that no glimmering of light should be wasted. Their dragons, lions and no less fierce human figures become in fact symbols of the wild times when they were carved. As he says in the first lecture:—

The Lombardic period is one of savage but noble life gradually subjected to law. It is the forming of men, not out of clay, but out of splendid wild beasts often as gentle as they are wild, but of unconquered animal nature. And all art of that date in all countries, including our own Norman especially, is, in the inner heart of it, the subjection of savage or terrible or wilful and wandering life to a dominant law. It is government and conquest of fearful dreams. There is in it as yet no germ of true hope, only the conquest of evil and the waking from darkness and terror. . . . If with this sympathy, you look at their dragon and wild-beast decoration, you will find that it now tells you about these Lombards far more than they could know of themselves. You may smile at my saying so: but all the actions, and much more the arts tell to others, not only what the worker does not know, but what he never can know of himself, which you can only recognise by being in an element more advanced and wider than his. And then also remember, even in deliberate symbolism, the question is always, as I have several times lately had to urge—not what a symbol meant first or meant elsewhere, but what it means now and means here. Now this dragon symbol of the Lombards is used of course all over the world; it means good here, and evil there; sometimes means nothing, sometimes everything. You have always to ask what the man who here uses it means by it. Whatever is in his mind, that he is sure partly to express by it; nothing else than that can be at all expressed by it. An angel to Angelico is an angel indeed; to Correggio it is a cupid; and a creature with eagle's wings and lion's limbs is to a Hebrew a cherub, to a Lombard a griffin.

The master of the Guild of St. George must have often pondered over the subject, and have asked himself why men are less eager than formerly to combine for the attainment of a common end? It has been so often explained as to become trite that men have not only individual interests, but from being units in a living mass duties arise which must affect their individuality. The Lombards, with all their fierceness, recognised the idea of the common good. At another period it inspired the Benedictines and Cistercians, as Mr. RUSKIN explains in his chapter called "Mending the Sieve." The sieve in question should be glorified or made a constellation by agricultural implement makers, for in the fifth century the founder of western monarchism treasured it, and by its use helped to keep himself from becoming a solitary, and set an example which the Benedictines still respect by experiments in farming

* *Verona and other Lectures.* By John Ruskin, D.C.L., LL.D. With Illustrations from Drawings by the Author. (London and Orpington: George Allen.)

which are not always profitable. The mending of the sieve, according to Mr. RUSKIN, is just as important in St. BENEDICT'S life "as the killing of the Nemean lion in the life of HERACLES." When chaos appeared to have come again, the monks preserved the world from degeneration. HALLAM acknowledges that we owe the agricultural restoration of a great part of Europe to them, and wherever they came, says SOAME, they converted the wilderness into a cultivated country. Mr. RUSKIN quotes what is said by VIOLET-LE-DUC about their labours in opening out the forests, directing the water-courses, and founding monasteries surrounded by workshops, which became centres to the peasantry of moral force and protected industry. Mr. RUSKIN describes the two great branches of the Benedictines by saying that "Cluny was founded for the schooling of the rich and Cîteaux for the help of the poor." Both exercised the greatest influence on the arts. The early Benedictine churches, according to Cardinal NEWMAN, corresponded with the simple, poetical, pastoral life of the brethren:—

The Benedictine made his way into the labyrinthine forest, and he cleared just so much of space as his dwelling required, suffering the high and solemn trees and the deep pathless thicket to close him in. And when he began to build, his architecture was suggested by the scene—not the scientific and masterly conception of a great whole with many parts, as the Gothic style in a later age, but plain and inartificial, the adaptation of received fashions to his own purpose, and an addition of chapel to chapel and a wayward growth of cloister, according to the occasion, with half-concealed shrines and unexpected recesses, with paintings on the wall as by a second thought, with an absence of display and a wild irregular beauty, like that of the woods by which he was at first surrounded.

When the almost idyllic life of the earlier brethren was supposed to be too easy, and when the scholastic philosophy had attempted some approach towards modern science, a more severe and unified style of church building became necessary. The first settlers at Cîteaux probably cared as little about architectural styles as the deluded victims in the American Eden which is described in "Martin Chuzzlewit." Mr. RUSKIN tells us that for the first Cistercians "the marsh of Cîteaux was too deadly, and they died, and died, nameless people, foolish people, what you choose to call them; yet they died for you and for your children." Then St. BERNARD came with his brothers and friends, and under his influence the Cistercians increased in Cîteaux and elsewhere; "in less than twenty-five years there were more than sixty thousand Cistercian monks at work on any bit of trenchable ground they were allowed to come at between the Bay of Genoa and the Baltic." How Mr. RUSKIN would rejoice if on the roll of his guild there was a tithe of that number.

St. BERNARD was a ruler of men, but there was nothing of the artist in his nature. In his hymns we see the Mediæval rhetorician rather than the poet. But as a logician he wished to have consistency in all things. His monks bound themselves to a life of severity; why should they expect to worship in churches where painting or carving gratified the eyes? Those who admire the Cistercian style forget that it was intended to correspond with the ideas of men who were well drilled and could see the relation between severity and fitness. The churches were not intended to attract the multitude of sinners by suggesting that the religious yoke was easy; they were built for the use of ascetics who had renounced all pleasures which are derived from sight. A man like Mr. RUSKIN, who could discourse eloquently on the beautiful things which the world contains and on the representation of them by artists, would be looked on with terror if he sought refuge in a Cistercian monastery, and be exorcised like the Nightingale of Basel of which HEINE speaks. Yet so strong is the influence which the power of St. BERNARD and his followers can still exert on susceptible minds, we find Mr. RUSKIN, who at one time would have held it to be a sort of religious duty to compel the masonry of churches to recall the flowers of the fields and the sweet singers above them, has brought himself to believe that in all that relates to the externals of worship we cannot have too little nature or too much geometry. The following remarkable passage will, we fancy, produce a saddening effect on those who are well acquainted with the author's writings:—

I do not think the readers of the essays on architecture, which of all my writings have had the most direct practical influence, will think their hour misspent in enabling me personally to ask their pardon for

the narrowness of statements into which either their controversial character or the special direction of my earlier studies hurried me. Of which faults, one of the chief lay in the depreciation of ecclesiastical influence, and the strong insistence on the national styles of civil building, into which my dread of ritualist devotion in the first place, and in the second my too sanguine hope of turning the streets of London into the likeness of those of Nuremberg, provoked or tempted me. It is indeed perfectly true, and I have nothing to retract from the distinctness of the assertion, that Gothic architecture is not, in the total spirit of it, more devotional than humane; that all the beautiful forms of it will condescend to the simplest domestic comfort, and that the luxurious and insensate splendours of it are as much forbidden to the church as to the palace and the council hall. But also it is true and salient among the noblest truths which illustrate the nature of man, that as the visionary faith of the Franciscans purified and animated the art of painting from its Roman pollution and its Byzantine palsy, so the modesty and valour of the Cistercians, subdued by the severe lessons of St. Bernard, and restricting itself always to the use of materials nearest to their hand, produced types of rational and beautiful structure of which the remains, in an age of iron, are still held sacred to the memory of the Catholic Church, and can scarcely be used in a civil building without a sense of profanity. The severe lessons I have said, admitting the popular impression of them. The loving lessons had been a juster word. He was the first of the noble Puritans in the rejection of all that was unseemly, luxurious or vain in the pretended service of God.

If any friend were to express surprise to Mr. RUSKIN about the foregoing passage, we suppose he would say that the work of the Cistercians might not have attained more success than the work of St. GEORGE (the two having many qualities in common) if in Cîteaux and Clairvaux there had been any allowance for the vagaries of the human mind. The doctors said that "I went mad," wrote Mr. RUSKIN once in "Fors," "from overwork. I went mad because nothing came of my work." He did not realise that in the twelfth century entertainment could be sternly rejected, while in our degenerate days a prophet would not be valued unless his message was supposed to be entertaining. All the world's a stage, and the wisest must take their turn in affording amusement. The Cistercians contrived to consolidate men's fears into power which was beneficial to Europe; under guidance as shrewd, perhaps, modern frivolity might also become a source of strength, or be made to serve some purpose that would be considered as exalted. What is feasible without any disruption of society is, however, suggested by Mr. RUSKIN at the close of his Woolwich lecture, when he says:—"While we live, the defence and prosperity of our country depend less even on hearts of oak than on hearts of flesh; on the patience which seeks improvement with hope, but not with haste; on the science which discerns what is lovely in character and honourable in act, and on the fine art and tact of happy submission to the guidance of good men and the laws of nature and of heaven."

The volume, as may be concluded from the extracts, is suggestive of the *Mannigfaltigkeit*, or multiplicity of talents, by which Mr. RUSKIN'S Teutonic origin is revealed. He appears in it as a geologist, an economist, a moralist, an artist, a poet, and his remarks on law and legislation are as acute as those on embroidery or the regulation of mountain streams. In spite of all efforts at plainness, the style is as delightful as ever. The illustrations have a new interest, for they show the adaptability of Mr. RUSKIN'S drawings to the modern processes of photographic reproduction.

LANDSCAPE PRESERVATION.

AT the recent meeting of the National Trust for Places of Historic Interest or Natural Beauty, held at Grosvenor House, the following resolution was unanimously adopted:—"That this meeting is strongly of opinion that land left to the nation for purposes of enjoyment, or as possessing historic monuments, should be exempted from estate duty, and respectfully urges the Chancellor of the Exchequer to extend to real estate the clause which he has undertaken to insert in the Finance Bill exempting from duty works of art and antiquities bequeathed to the public." The Duke of Westminster has now received from Sir W. V. Harcourt the following letter:—
11, Downing Street, Whitehall, S.W.: July 17, 1894. Dear Duke of Westminster,—I have much sympathy with the objects of your meeting of yesterday. Your resolution, however, arrived this morning after the report stage of the Budget Bill was closed, so that it was not possible to make any provision for it in that Bill. It is a subject, however, which will, no doubt, come up for consideration in future years.—Yours truly, W. V. HARCOURT.

THE CATHEDRAL OF YORK.

THE twenty-eighth annual meeting of the Yorkshire Archaeological Society was held in York on July 18. The first visit of the members was to the cathedral, where Mr. J. T. Micklethwaite acted as guide. He pointed out how, from the time of the Saxon church, begun by King Edwin in the seventh century, the original design of the first edifice had been developed in those that superseded it, until the magnificent pile of buildings now witnessed was formed. That such was the case was proved beyond doubt in the enormous width of the nave of the first church. As time went on efforts were made to make the chancel, which was originally very small, in keeping with the width of the great nave. The chancel having been brought into proportion, it was necessary to widen the transepts. Each superstructure, however, was carried out in order to complete one harmonious whole, and though there were necessarily changes in detail, the essence and design of the work were practically the same. Thus the relative dimensions of each new member of the cathedral to the one which it had superseded were brought into direct comparison. It was shown how the gradual changes by which the Norman cathedral was converted into the existing cathedral were worked out. There was first a new choir, secondly a pair of new transepts, thirdly a new nave, and lastly a second new and still larger choir. And these successive additions exceeded the former portions not merely in length, but also in breadth. Special attention was called to the unique character of the stained-glass in the cathedral windows, much of it being very old and but little worse for the fires it had been subjected to. The magnificence of the chapter-house, which was next visited, conveyed an idea of the rivalry that is said to have existed among the great cathedral chapters of the country as to which of them should possess the finest chapter-house. In gorgeousness York chapter-house would be hard to excel, and that in the opinion of its founders it would be positively impossible to do so may be gathered from the device which greets the eye as one enters:—"Ut rosa flos florum, sic est domus ista domorum." The chapter-house claims to stand unrivalled amongst English chapter-houses. The great east window, one of the glories of the cathedral, attracted special attention. This remarkable window, which is often referred to as a history of the Bible in miniature, is the largest window in England, or probably the world, containing its original glazing. In the lady chapel, which fronts this east window, are the monuments of several of the archbishops of the see in the seventeenth and eighteenth centuries. In alluding to the pastoral staffs that apparently lay alongside of them, Mr. Micklethwaite observed that it seemed clear that these staffs or croziers were used in those centuries, although it was difficult to ascertain anything definite about that particular period. It was easier to obtain accurate information concerning earlier centuries than those comparatively recent times. Still another proof of the use of croziers about the time in question was the fact that on the introduction of the Church to America its bishops had staffs, and it was hardly likely that such an innovation would have been attempted in America if the practice had not been in existence in England. After paying a visit to the crypt the party proceeded to the vestry, where the Minster plate was exhibited and described by Mr. W. H. St. John Hope. Amongst this collection were a number of ancient chalices, a silver pastoral staff, the signet rings of Archbishops Sewal, Grenfield and Bowet. Other curiosities in the vestry comprised an ancient coronation chair, the Maser Bowl or indulgence cup of Archbishop Scrope, and the famous horn of Ulphus—a valuable relic of ancient art, and said to form the title by which the chapter still hold several of their estates.

NATIONAL ART TRAINING SCHOOL.

THE prizes won at the National Art Training School during the sessions of 1892-93 were distributed by the principal, Mr. John C. L. Sparkes, on Tuesday. The following medals and prizes were gained by the students in the national and local competitions and in examinations in 1893:—Five gold, 38 silver and 47 bronze medals, 127 national competition books and 19 Queen's prizes; general students—one gold, two silver and seven bronze medals, 10 national competition books and three Queen's prizes; students in training, national scholars and free students who take honorary awards—four gold, 26 silver and 40 bronze medals, 99 national competition books and 16 Queen's prizes; local competition, open to students of the schools only—10 silver medals, 18 national competition books and four prizes of lower value; at the third grade or highest art examinations 34 art certificates were obtained by students in the National Art Training School; at the elementary examinations in May 96 students obtained 109 passes first class and 44 passes second class, seven obtained the elementary drawing certificate and one the second grade certificate, and 21 art class teachers' certificates were taken.

Mr. Sparkes in his address to the students said that great school was occupied mainly in providing education in practical art to men and women, who in some near future would be the teachers of what they now learnt, and it thus had an influence differentiating it absolutely from all other schools in the country, and indeed from any others in Europe that he knew. In its double capacity as a training school for teachers and a practising ground for designers, with access to a museum like that at South Kensington, it also held a singular position. Its importance made it an object of criticism, especially from those who really knew nothing about the matter. The favourite taunt was that schools of art in general, and the National Art Training School in particular, were producing painters of poor pictures and sculptors of equally poor statues. But there was something to be said in favour of the training that had attracted such artists as Clausen, Woods, Fildes, Clara Montalba, Shannon, Llewellyn, Menpes and Frank Short, to mention no others. Their friendly critics, on the other hand, were usually directors of art schools abroad or writers in the art papers of Europe, or foreign manufacturers who had taken the trouble to visit this country to see for themselves. As a rule they paid a generous tribute to the work of that and the affiliated schools. Many of our home manufacturers bore similar testimony. It was acknowledged abroad that English design and taste were leading in the race, notably in furniture and surface decoration. It would be misleading to say that all the great increase of taste in England was the clear product of these schools; equally would it be unjust to ignore the marked influence which they exercised.

THE TEMPLE OF PHILÆ.

THE following letter has been addressed to the Earl of Kimberley on the subject of the proposed reservoir on the Nile:—

My Lord,—The great interest which we, the undersigned, take in the history and archaeology of ancient Egypt induces us to respectfully address your lordship on the subject of the proposed erection of a reservoir on the Nile.

The importance of Egypt in the history of civilisation is now so fully recognised that we feel that we may rely upon your lordship's sympathy in the consideration of any means whereby injury to or destruction of the ancient monuments of that country may be avoided, without in any way hindering the material development of the land.

In the consideration of the several schemes recently put forward for the formation of a reservoir, it appears that some important points have not yet received the notice which we venture to think they demand.

1. The construction of a high-level dam at Aswan would submerge the region of Nubia nearest to Egypt, and ruin the temples of Debod, Gertasseh, Tafah, Kalabsheh, Dendur, Dakkeh and Offa ed Dunya, as is shown by the levels of those temples recorded by the Egyptian engineers on the maps of their report; it would also ruin the forts of Kostemneh and Kubban, and the towns, cemeteries and various other remains of this region, beside leading to the ruin or removal of the various temples of Philæ. Such a dam would be the most destructive of any that have been suggested.

2. It has been pointed out—from an intimate knowledge of the details of the cultivation—that it would be impossible to utilise all the water of so great a reservoir for many years to come. The industrial as well as agricultural conditions of the country will need to be largely modified before they will require so great an increase in the water supply; and this modification can only be gradually effected. Hence it would seem to be preferable to adopt some scheme which is capable of expansion, and which would not entail the whole expenditure long in advance of the result.

In view of this, proposals have been made for constructing a lower dam at an available point, with the addition at a later period of another above it, possibly in the Soudan; or for building the lower part of a large dam at a point where it would effect the least injury, and afterward increasing its height as the requirements develop.

3. If a single dam should be decided on as being the most beneficial, no necessity has been shown for its erection at Aswan. Though that site may be the most convenient, yet the facts stated in the report on perennial irrigation show:—

That a dam at Kalabsheh would insure exactly the same benefits to Egypt;

That, according to the fullest estimates of Mr. Garstin, it would cost about the same amount, after fully allowing for all difficulties of construction;

That the site at Kalabsheh is "geologically a good one";

That the required depth of the foundations of the dam, though presenting difficulties, would be much less than that attained in work already executed;

And that, even if more immediate expense were incurred by placing a dam at Kalabsheh rather than at Aswan, the estimated profit from it is so great that the gain accruing to the

country in only a few weeks would balance any additional expenditure attaching to a scheme which would have the merit of sparing the threatened antiquities.

Without, therefore, any desire to intrude on the technical considerations of the various subjects, whether of one dam or several, and without presuming to suggest any one course of action in particular, we venture to call your lordship's attention to the statement of the engineers whose proposals show that there is at least one feasible alternative to the placing of a great dam at Aswan—an alternative which seems in every way as good for the country, one which is certainly far less injurious to the interests of history and archaeology. Whatever it may be needful to sacrifice for the material prosperity of Egypt, surely the sacrifices demanded for a great reservoir at Aswan are uncalled for if equal benefits can be otherwise obtained for the same cost, and with far less destruction of the permanent glories of the land.

Among the signatories are Sir Frederic Leighton, Mr. Poynter, Professor J. H. Middleton, Sir Wollaston Franks, president, and Mr. Hilton Price, director of the Society of Antiquaries; Mr. Drury Fortnum, Mr. Maunde Thompson, principal librarian of the British Museum; Viscount Dillon, president of the Royal Archaeological Institute; General Pitt-Rivers, Sir Henry Rawlinson, Mr. Arthur Evans, keeper of the Ashmolean Museum, Oxford; Dr. E. B. Tylor, keeper of the University Museum, Oxford; and Dr. Flinders Petrie, professor of Egyptology, University College, London.

ANTIQUITIES FROM KOPTOS.

AN exhibition of remains discovered by Professor Petrie during the early part of this year is now open in the Edwards Library of University College, Gower Street, and will be on view until September 1. The site which was selected for exploration was that of the important town of Koptos (now represented by Kufu), about thirty miles north of Thebes, which formed the Nile termination of the oldest trading route of the world, the roadway passing through the valley of Hammamat to the shores of the Red Sea. Tradition had always pointed to Koptos as being one of the first settlements founded by the dynastic Egyptian immigrants when they arrived from their home in the sacred land of Punt in south-western Arabia. The site of the temple has been thoroughly cleared, and the result has been the discovery of no less than six successive temples, ranging from the most remote prehistoric time to the age of the Ptolemys, and the recovery of hundreds of objects of the greatest interest and of the memorials of thirty-four rulers of Egypt. The objects, however, in the collection which will excite the most interest, says a correspondent of the *Times*, are those which deal with the prehistoric age in Egypt. Hitherto Egyptian art and civilisation have presented a striking paradox. The farther back we go the better the art, the more simple and yet perfectly developed the social life. Beyond the age of Senefru, the builder of the pyramid of Medum, there was no trace, no earlier records, of the beginnings of the social life of that period. In the lowest strata of the temple at Koptos the explorer has discovered remains of an ancient settlement, which for the first time reveal to us prehistoric Egypt.

There is on exhibition here the massive head of a statue which is one of three figures found at a great depth beneath the Ptolemaic temple, statues of 13 feet high, and which are little more than long truncated cones, the arms and legs being simply indicated by hammered out lines, and the ears and whiskers in the same manner. There is not the slightest trace of chisel-work upon the whole. Around the waist of each are girdles upon which are a series of curious drawings, evidently the Totem figures of the god of the primitive people. These, then, are probably the first statues of Min, the god of Koptos. It is important to notice that the face is in no way indicated, and was probably represented by a wooden mask. This seems very possible when we remember that Bes, the distinctly Punite god, is always represented as wearing a mask, and that he was the god of laughter and dancing; and one of the principal features in the worship of Min was dancing, as we have a representation here of Usertesen I. dancing before Min. The rough sculptures which adorn the bands and girdles upon the figures have been very carefully cast and are exhibited here. The first is the fetish pole of Min, represented by an upright staff with a bouquet of flowers at the top and surmounted by an ostrich feather; and hung round the pole are offerings consisting of pteroseras shells and swordfish. On another we have a representation of the elephant, while the best and oldest of them is a remarkable drawing of the head of a gazelle. It will at once be seen that these objects serve to connect the early settlers with the shores of the Red Sea and the district of Somali land, where the elephant would be known to them. The connection, then, between Arabia and the dynastic Egyptian is no longer a theory, but an established fact.

Another series of objects which will be of especial interest to archaeologists is a collection of rude pottery made of coarse Nile mud, but carefully polished with red hematite. There is little doubt that the work here belongs to the period of the first or second dynasty, as the representation of a dog with a peculiar rope collar, which is modelled on a large oval stand, is never found after the time of the third dynasty. These fragments, however, show considerable artistic skill, and indicate that the secret of the perfection of Egyptian art in the fourth and fifth dynasties is to be ascribed to a school of artists who had learned to model in clay. The same finish which they had been able to impart to the plastic clay they continued to use in soft stone, wood and, later, in the hardest materials. It is this existence of the pottery work which explains the peculiar conventions of stone sculpture, the placing of the legs forward, the uniting of them by a slab or stiff pier at the back of the figure, which would all be required when the artist was working in a yielding material such as clay.

Passing now to the prehistoric period there are many objects to be noticed, an alabaster vase inscribed with the cartouche of Kufu, the builder of the first pyramid being the earliest. It is, however, from the period of the eleventh and twelfth dynasties that the most valuable work is obtained. Hitherto there has been no temple sculpture of the period of the eleventh dynasty, the age of the Antefs. Antef V. built the temple of Koptos of brickwork faced with stone, and several fragments of his work have been recovered. This is extremely important, as hitherto no sculptures of this monarch have been brought to Europe. They are in excellent preservation and the hieroglyphics are cut with the most minute care. They seem to have been removed during the period of the twelfth dynasty and turned face downwards to form a pavement, and thus they have retained all their sharpness during these many years. It is curious to see during the period of the Antefs dogs most frequently occurring in the sculptures, sometimes pet dogs, but usually hunting dogs. This is probably due, as Professor Petrie suggests, to the fact that Egypt not being powerful enough to be aggressive at this period, the nobles devoted much attention to hunting and thus the dogs became great favourites of their masters and were represented on their monuments. Of the period of the twelfth dynasty there are two of the finest pieces of work which have ever reached this country—one a figure of Usertesen I. dancing before Min; the other a representation of Amenemhat standing before Min. The former of these is in intaglio; in the latter the hieroglyphics are raised. The delicate finish, attention to the minutest details, and above all the excellence of the material render them the gem of the collection. There is a very interesting inscription of the period of the eleventh dynasty which records the deposing of the Prince of Koptos for treachery and the installing of a new family in his place. This was done by means of a Royal Commission, the names of each of its members being given. Special decrees are made as to the family deposed, and punishments for persons who in any way communicate with them.

On one side of the room are exhibited an important series of objects forming the foundation deposits of the temple at Koptos built by Tothmes III. These deposits were found in pits under the centres of the wall placed at the bottom of the pit, the upper part being filled in with hundreds of vases. The deposits consist of bronze models of tools, knives of various sizes, narrow chisels, broad chisels, axes, all of them in miniature and inscribed with the words "Tothmes, beloved of Min of Koptos." A number of model corn-rubbers were also found in each deposit, made of sandstone and inscribed with blue paint. The object of these toys (as we may call them) apparently seems to have been that the *kas* of the workmen represented by the tools might for ever be employed in restoring the carved temple. In exploring the Ptolemaic temple Professor Petrie found also the deposits placed there. These seem to consist principally of representations of the materials used in the construction of the temple—pitch, alabaster, basalt, copper, lead, made bricks, plaques of red glass, ingots of lead and copper, and small gilded limestone plaques evidently representing gold. It is very curious to notice that an almost similar deposit was found in the palace of Sargon, King of Assyria, B.C. 722, at Khorsabad.

From the Ptolemaic temple come several objects hitherto unknown. Three tanks having fourteen steps on each side ascending and descending from and to the water, are exhibited. These are evidently models of the sacred tank of Min, and one of them bears an inscription of Aristius Saturninus. The use of these tanks seems to have been for the wealthier persons to perform the ablutions of their hands and feet before entering the temple, and thus to avoid using the great tank of the common herd. At the bottom of one tank is the model of a foot. Among the Ptolemaic fragments are a number of pieces of carving, apparently window frames, one of them having a curiously enlarged representation of the Egyptian symbol of life. The lions' heads which form the water-spouts of the Ptolemaic temple are very handsomely carved. In the portico

of the college are exhibited several objects from the Ptolemaic temple, including a large wall scene of Ptolemy Soter adorning Min. Here also are some fragments from the oldest foundation—a large bird, apparently a hawk (which bears a curious resemblance to the figures found by Mr. Bent in Mashonaland), and some very rudely sculptured lions.

The collection represents the results of eleven weeks' work upon this site, and we may say that it was amply proved how rich a field Koptos was, and how correct archaeologists were in looking for explorations here to solve some of the most difficult problems that have been so long before them.

TESSERÆ.

Correggio as a Painter.

OF chiaroscuro on the grandest scale, as it extends to the regulation of the whole of a work, Correggio was certainly the inventor. Antecedently to him no painter had attempted, or even imagined, the magic effect of this principle, which is strikingly predominant in all that remains of Correggio, from his widely extended cupolas to the smallest of his oil-paintings. Its sway was uncontrollable; parts were enlightened, extended, curtailed, obscured or buried in the deepest shade in compliance with its dictates, and whatever interfered (even correctness of form, propriety of action and characteristic attitude) was occasionally sacrificed. By classing his colours, and judiciously dividing them into few and large masses of bright and obscure, gently rounding off his light, and passing, by almost imperceptible degrees, through pellucid demi-tints and warm reflections into broad, deep and transparent shade, he artfully connected the fiercest extremes of light and shadow, harmonised the most intense opposition of colours, and combined the greatest possible effect with the sweetest and softest repose imaginable. The same principle of easy gradation seems to have operated as his guide in respect to design as well as in colouring and chiaroscuro. By avoiding straight lines, sharp angles, all abrupt breaks, sudden transitions and petty inflexions, and running by gentle degrees from convex to concave, and *vice versa*, together with the adoption of such forms and attitude as admitted this practice in the highest degree, he gave his figures that ease, elegance and flexibility, that imitable grace which, in honour of the inventor, has since obtained the appellation of Correggiesque.

The Pedimented Roof in Greece and Rome.

A bold roof kept up its full height the whole length of the building, or of that part of the building which it covers, and with a visible and well defined termination, is a thing of the same class as an upright bearing of the body, a correct process of reasoning, a well-sustained climax, or a straightforward line of conduct. There happens not to be any minor question of taste and feeling to which the rule of universality more applies. Thus the chorus of birds in Aristophanes (*Aves* i. 110), amongst various golden hopes which it holds out to the judges, promises, very possibly in allusion to some well-known instances of private presumption, that they shall live as it were in temples, for that it will roof their houses with a pediment. Julius Cæsar was allowed by the senate the unprecedented dignity of a pediment to the front of his house, adorned like that of a temple, together with other honours heretofore confined to divinity; and we find the constitutional Roman very justly regarded it with a mixture of religious and political abhorrence (*Cic. Phil.* ii. 43), and Plutarch in his well known list of omens preceding the death of Cæsar, relates that Calpurnia woke her husband the previous night by her cries and groans in her sleep, having dreamt that the said pediment had tumbled down, and that on the strength of this warning she endeavoured to persuade Cæsar to adjourn the senate. There is a remarkable passage in *Cicero de Oratore* (iii. 46) on this very subject. He is arguing the universal law, that all true beauty is founded in utility. Having illustrated it by a very wide and particular induction of the works of nature, from the mechanical system of the universe up to the human frame, he thus proceeds:—"From nature let us pass on to art. What is so necessary in a ship as the sides, the ribs, the prow, the stern, the yardarms, the sails, the masts? Yet they have all so much beauty of form that one would suppose they had been devised not merely for the working of the vessel but also for the gratification of the eye. Columns are necessary to sustain temples and porticoes, yet they are of no less beauty than use. It was not taste but absolute necessity which formed that pedimented roof of the Capitol and other temples. For when it was considered how the water should be made to flow down both sides of the edifice, the dignified form of a pedimented roof was found to agree best with the convenience of the temple, so that even if a temple were built in heaven, where there could be no rain, it would appear devoid of dignity without a pedimented roof." The argument which Cicero draws from the external effect of a rightly-shaped roof applies also with a peculiar felicity to the

form and details of the interior. As the beauty of a ship consists in the graceful adaptation of all its necessary timbers, ropes and spars, so the beauty of a roof depends on a graceful modelling and arrangement of its beams, rafters, purlins and so forth. True beauty disappears and becomes mere grimace and foppery as soon as the notion of utility is lost sight of.

Wren and Bacon.

It was not until the age of Wren that the inductive process of Bacon was duly understood and appreciated. This period, on the eve of Newton's great discoveries, was perhaps the most important that has yet occurred in the annals of science. The spirit of inquiry, at first feeble, which actuated some individuals at the time of the revival of learning, had from numerous causes gathered strength and spread itself over Europe. Bacon had turned his powerful and creative mind to the state of human knowledge, marking its imperfections and planning its improvements, amending the vagueness and uncertainty of physical speculations, and supplying the want of connection between the sciences and the arts. This and the illustration of Bacon's method by Galileo and his contemporaries (amongst whom Wren was eminent), first led the way to the general adoption of the new philosophy—reasoning gradually from particulars to those that were only one step more general; not, as formerly, adopting general positions drawn suddenly from particular instances hastily assumed. It was now felt that facts and not opinions were the things to reason about, in order to arrive at the knowledge of the laws governing the material world; and Bacon himself had foreseen the formation of a society directed to scientific improvement, and has given a general outline of it in the *Nova Atlantis*. And it was now that the enthusiastic ardour in the pursuit of natural philosophy was awakened in the minds of literary men, and which has ever since remained undiminished. None of the members of these meetings were more conspicuous than Wren, who, together with Boyle (the improver of the air-pump), had imbibed the true spirit of Bacon. They applied themselves to the prosecution of experimental science, being the avowed enemies of the philosophy of Aristotle; following up the true principles of the new philosophy by preparing a history of the phenomena of nature in all their modifications and varieties, and instituting every form of experiment for the sake of discovery. Wren was one of the first (in conjunction with Wallis, Huygens, Newton, Leibnitz and the Bernouillis) to occupy himself with the investigation of the cycloid, which had been discovered by Pascal; and he constantly urged, in his communications to the Royal Society, the importance of experiments and observations on facts. "For the improvement of theories," he observes, "we need be least solicitous; it is a work which will insensibly grow on us if we be always doing something in experiment; and every one is more prone to exercise his fancy in building paper theories than patient first to pile the unsure foundation and hew solid materials out of the history of nature: this is rather our task, and in many things we must be content to plant crab stocks for posterity to graft on; and instead of the vanity of prognosticating, I could wish we would have the patience for some years of registering past times, which is the certain way of learning to prognosticate; experiment and reason is the only way of prophesying natural events, in combating prejudices, detecting error and establishing truth."

John Aubrey on English Houses.

Aubrey, writing in the seventeenth century, describes, in his quaint and picturesque way, the characteristics of the old manorial or hall-houses of the times of the Plantagenets and Tudors. "The architecture of an old English gentleman's house (especially in Wiltshire and thereabout) was a good high strong wall, a gatehouse, a great hall and parlour; and within the little green court, where you come in, stood on one side the barne. They then thought not the noise of the threshold ill musique. This is yet to be seen in severall old houses and seates, e.g. Bradfield, Alderton, Stanton St. Quentin, Yatton Keynell, &c." These words are found in a MS. in the Ashmolean Museum, which is the rough draft of, or rather an imperfect collection of materials for, a history of his native county, Wilts. Aubrey begins by what he calls "Chronologia Architectonica," or an inquiry into the history of English architecture. He, however, makes but very little way in this branch of his work, not having even clearly arrived at a knowledge of the relative ages of the circular and pointed arches. The old antiquary's sad and woful regrets after the "good old times" of heritable jurisdictions had their root probably in the destruction of his own hereditary property during the civil wars. The embarrassments which commenced then at length reduced him to complete poverty, in which he died about 1680. "The Saxons," he says, "who succeeded the Romans in this country, were so far from having arts that they could not even build with stone. The church at Glaston was thatched. They lived sluttishly, in poor houses, where they ate a great deale of beefe and mutton, and drank good ale in a brown mazzard, and their very kings were but a sort of farmers. The Normans then came and taught them civility and building."

Criticism of Architecture.

We may judge of details by rule, but the only true method of estimating the excellence of an architectural composition is by the sentiment it produces. It must be acknowledged that this is in some respects an uncertain criticism, as the impression produced depends in part upon the temper of the mind at the time, and even on the feelings of the body. However, we may make allowances, and we may repeat the trial under different circumstances.

Titian and Rubens.

Titian mingled his tints as they are in nature, that is, in such a manner as makes it impossible to discover where they begin or terminate. Rubens's method, on the contrary, was to lay his colours in their places, one by the side of the other, and afterwards very slightly mix them by a touch of the pencil. Now as it is an acknowledged principle in the art that the less colours are mingled the greater their purity and vivacity, and as every painter knows the latter method to be the most learned (requiring a deeper knowledge of the subject), to be attended with a greater facility, and, if properly managed, with greater truth and vivacity of effect, it must follow that this difference in their practice, which has been adduced to prove the inferiority of Rubens to Titian, indisputably proves the reverse. Although it must be allowed, perhaps, that in practice he at times uncovered too much the skeleton of his system, and rendered his tints too visible for a near inspection, there is no doubt that, on the whole, he was the most profound theorist; that more may be learnt from him respecting the nature, use and arrangement of colours than from any other master; and that had he not been in some measure the dupe of his own powers his name would have stood first in the first rank of colourists. Rubens, like other men of his degree of eminence, produced a multitude of scholars and imitators to whom he stood in the place of nature, and whose excellence can only be measured by their proximity to or distance from their great archetype. The best of their works are now probably, and not improperly, attributed to him, from whose mind the principle that directed them emanated. From him they learned to weigh the powers of every colour and balance the proportion of every tint; but, destitute of his vigorous imagination, the knowledge of his principle became in their hands a mere palliative of mental imbecility (leaves without trunk), and served only to lacquer over poverty of thought and feebleness of design, and to impart a sickly magnificence to stale mythological conceits and clumsy forms of gods without dignity, goddesses without beauty and heroes without energy, which disgust the more for the abortive attempt to conceal by colouring the want of that which colour can never supply.

Coupled Columns.

The use of coupled columns is so absurd, and they are confessedly so inelegant that it seems almost unnecessary to proscribe them. Suppose apertures, such as windows, arranged in couples throughout an elevation, with very narrow and very wide piers alternating, and both the absurdity and the inelegance become manifest; now, neither the one nor the other can be lessened or changed by reversing the case, and putting alternately wide and narrow openings, as in coupled columnar ordinances. Columns may with propriety be put further apart when they are attached than when they are insulated, because the entablature, resting in part on the wall, is neither in fact nor in appearance made infirm by the distension, as it would be if it rested on the columns alone. All the parts of the same edifice which come into view under any circumstances at the same time should correspond; but insulated and attached columns of the same ordinance and in the same elevation may, under certain circumstances, without impropriety be arranged with a different intercolumniation.

Choice of Subject in Landscape.

In the first choice of a subject there is some cause that induces our selection of it. Either we see the scene under some peculiar effect of sunshine or of gloom, of mist, of sunset, or of twilight, which makes it strike us with a sense of its beauty, or of its fitness for the painter's art. It may even be some mere accident seen once and no more, a stream of sunshine peculiar to some few flitting moments of time, a group of accessory figures, some mere incident of season or of industry; it may be but a volume of smoke from burning weeds, or the column rising from some cottage chimney when the housewife lights her fire to greet her husband on his return from labour, or higher still, some association that strikes a chord of feeling in the artist's mind. Now the painter must treasure up the incident or feeling that awoke this sense of pleasure in the scene, and must reproduce it on his canvas—or he will find that even to himself, much more to the public, his work will be tame and spiritless. Thus then mere imitation is precluded in practice, and must be assisted by memory. How often do we find that on returning to a scene that had struck us as replete with loveliness, the sense of its beauty is gone, the whole appears dull and commonplace. And why? The sunshine or

shadow, the accident that gave it sentiment, that added life or poetry to the prose, is gone, and the result is lifeless insipidity. Again, the art of the painter may consist either in fixing such fleeting accidents as above alluded to on his memory to reproduce them in the progress of his work, or in imagining like incidents to relieve the insipidity of the subject of his choice—the latter showing the higher gift. All the incidents and accidents we have glanced at as adding interest, sentiment or beauty to scenery are more or less evanescent and fleeting. The ray of sunlight which gave point and glory, light and shade to an otherwise prosaic landscape, passes away ere the painter has fixed his easel or spread his palette—the very sun in running his daily course momentarily changes the scene before him, the cloud passes away and is gone, the figures journey onwards—and he who relies on painting a detailed imitation of what he sees has to paint commonplace, or to bear in memory during his sitting a state of the scene that has passed ere he begins his work, and which is constantly at variance with what his eye rests on. Nay, the most poetical phases of landscape are of all the most fleeting. What, for instance, is so beautiful as sunset?—what so worthy of the landscape-painter's skill? But the sun pillows himself in his cloudy couch of crimson and gold, and draws around him the dim curtain of night, while we are too transfixed with the purple and the molten gold to do more than gaze and admire.

Simplicity in Architecture.

Simplicity and harmony are the elements of beauty in architecture—simplicity in the general form and arrangement of a subject, and harmony in the collocation and combination of its various parts. Without these qualities a structure can never possess either dignity or grace, and with them it will certainly possess the attractions of both. The outline, then, most conducive to beauty in architecture is that which bounds the most simple forms. These are the parallelogram and pyramidal, in which the lines are straight and uninterrupted throughout their whole length. The ancient monuments of Egypt, of Greece and of Rome offer the most complete exemplifications of this. No other than the long unbroken line which bounds the temples of Egypt could produce an effect so grand, and no other than the simple, square and pyramidal forms could be productive of so much dignity as they possess. In the pyramids and obelisks of the same country the effect of this simplicity is even more obvious. In the temples of Greece, again, the same dignified simplicity is still predominant, for although in them the parallelogram and pyramid are combined, they are not confused, their mass consisting of a parallelepipedon whose ends are surmounted by vertically faced pyramids, connected by an unbroken line of ridge running parallel to the horizontal boundaries of the sides. Those of the Roman monuments which are deficient in simplicity are also deficient in beauty. Such are the triumphal arches, whose general form is broken by columns and arches which subject themselves to no commanding outline, but are all at the same time prominent features of, and excrescences from, the general composition. In the temples which are on the Greek model it is not so, nor is it so in the long series of arches in the Roman aqueducts, which are crowned and connected by commanding lines, unimpeded by projections or protuberances of any kind. The crucial form of the Pointed cathedral may be thought to detract somewhat from its simplicity and so much from its beauty; but it is an aggregation of simple forms, perfectly coherent with the tendency of the leading lines in the style which, we have seen, is vertical, and the lines are therefore not broken by the projected masses of the transepts, as they would be in the Egyptian and other styles, the tendency of whose commanding lines is horizontal. Otherwise the Pointed cathedral is a modification merely of the form of a Greek temple, with other parallelogramic forms added to it, as towers, or pyramidal, as spires. The same principle will be found to pervade the best works of the Italian school, more or less modified according to its application.

San Miniato, Florence.

The interior is remarkable for its pure and perfect Roman style. Triplets of fine arches rise from Corinthianised capitals. In the construction there is an important architectural peculiarity. Large arches are thrown over the nave, connected with smaller arches which are thrown over the aisles, assisting to support the roof, binding the whole fabric together and giving it additional strength. When these arches occur the pillars are exchanged for compound piers, one shaft of which is carried up to meet the arch they sustain. Above this is the roof of wood, as in the Roman basilicas, crossed with painted beams and open to the rafters. Beneath the mosaic in the apsis are the windows, apertures in the stone wall, each filled with a single slab of translucent alabaster—one of the classes included in the genus of the lapis specularis of the ancients; as far as we can ascertain, they are the only surviving examples of this most ancient mode of illumination. In the morning, when the sun shines on them, they diffuse a cloudy roseate beam; at other times of the day they are nearly obscure.

NOTES AND COMMENTS.

THE safety of St. Paul's Cathedral in case of a fire concerns more than England. It is therefore satisfactory to learn on the authority of Mr. PENROSE, the "surveyor to the fabric," that care has been taken to insure an ample supply of water independently of what is obtainable from the mains of the New River Company. A considerable body of rain water is always stored in tanks immediately under the ball and cross, with fire hose and proper arrangements for discharging it upon any part of the dome which might be threatened. There is also a much larger supply at the foot of the dome, and a powerful fixed force-pump to communicate between the two. Arrangements are made for distributing the water from these tanks to any part of the main roof. It is believed that there is enough storage to keep the external leadwork sufficiently cool to prevent the roofs taking fire in the supposed case, until the steamers of the Fire Brigade could replenish the storage from the mains. There is also telephone communication between the Cathedral and the Fire Brigade station. Wood and lead, which are so largely used in the upper parts of the building, are not fireproof materials, but at St. Paul's the wood is generally oak, which Sir E. M. SHAW prized above many materials for its resistance, and the lead is much thicker than that commonly employed in our time.

AFTER taking time for reflection and for examination Mr. Justice COLLINS has given his decision in the action taken against the Bowness Local Board in order to prevent the sewage of the town from entering Lake Windermere. The Rivers Pollution Act of 1876, while prohibiting acts of the kind, provides that if the person or persons causing the offence can prove to the Court that the best means to prevent sewage entering a stream had been employed, then the penalties could not be enforced. The Bowness Local Board pleaded that they had complied with the conditions prescribed, and that the sewage was so transformed and purified by the processes to which it was subjected that it could not be described as sewage when it entered the lake. That was satisfactory; but the question was, according to Mr. Justice COLLINS, whether what was done could be described as the best means available. Now it was given in evidence that the Board proposed at one time to purchase more land in order that the purification could be improved, and the scheme was approved in London. But before any steps could be taken an election occurred and the advocates for improvement were defeated. The Judge, therefore, considered that something more could be done. He made an order requiring the defendants to abstain from the commission of the offence—that was, to abstain from sending any sewage into the lake without using the best practicable and available means of rendering it harmless, but the order is not to take effect for at least six months. His lordship advised the Bowness Board to obtain the certificate of the inspector under the Local Government Board, which would be the best evidence they could have, and they would then be absolutely secured from any interference. The decision is likely to raise the hopes of rival patentees who have invented processes of sewage purification, for as long as it can be stated that some means which is likely to produce a more satisfactory effluent remains untried there is a chance for litigants. One of the witnesses in the Bowness case said the effluent after his process would be sparkling, and there is little doubt the Judge was impressed by the word, especially when he saw what was being poured into Windermere. But if legislation is to continue until sparkling sewage is obtained, lawyers will enjoy a prosperous period.

THE history of church bells presents many remarkable incidents, and the parish of St. Michael's, Coventry, has added another which appears to be unique. As has happened elsewhere, the bells caused strains which the tall steeple could not resist, and in consequence there was a costly restoration. During the operations the bells were removed, and there were apprehensions that if they were allowed to swing uproarious as of yore another restoration

would be inevitable. As COWPER says, there is in souls a sympathy with sounds, and some of the parishioners appeared to be afraid they would cease to be devotional unless they were called to prayer regularly by the old chimes. Accordingly it was resolved to erect a lofty campanile in order to provide for the bells. Some of the promoters of the restoration were dissatisfied because the scheme had assumed a new character, and withdrew their support. But, on the other hand, promises were made which denoted remarkable munificence. One gentleman, the late Mr. WOODCOCK, appeared prepared to pay a sum which is described as varying from 5,000*l.* to 35,000*l.* His death caused the collapse of the campanile project. The bells are still on the ground, affording amusement to young campanologists, who are able to kick occasional sounds out of them, and there is no money to raise them to their old position. Mr. J. O. SCOTT, who had charge of the restoration, considers that, while it would be very unwise to ring the bells in the steeple, there is no danger in chiming, and with that opinion Messrs. TAYLOR agree. The simplest course under the circumstances would be to subscribe the two hundred pounds which are required for the rehanging, and for an important parish like St. Michael's that end ought to be soon attained. But, strange to say, some of the parishioners have a hankering after the campanile, while others profess to care little for bells that are not in full swing. The peculiar circumstances of the restoration and the disunion which the bells caused have left a balance of about 800*l.* still owing on account of the work done, for which some members of the committee are liable. There are other debts also. It is proposed to hold a bazaar to raise money, but as the debt must first be cleared out of the sums received, it would appear that the bells are likely to remain a long time before they can be raised above the commotions of St. Michael's parish.

IT is not often the Society of Antiquaries interferes with building schemes, but if ever such a course of action was justified it is in the case of the Bath Pump Room annexe. The new building cannot be carried out without the destruction of Roman masonry. In itself that is a sacrifice to be regretted, for a piece of work measuring 20 feet by 30 feet is not everywhere to be found. It should, however, be remembered that archæology is becoming a progressive science, and that problems may arise hereafter which would be determined more readily with the aid of the evidence which the baths committee have doomed to destruction. There might be some slight excuse if the annexe could not be constructed while so much Roman work remained. But nobody on the Town Council would be bold enough to adopt that theory, and there is enough architectural skill among us to get over any difficulty which the ancient work may offer in dealing with the site. The Bath Town Council unfortunately cannot bring themselves to imagine that they have a trust which it is their duty to carry out faithfully for the sake of posterity. They take a commercial view of the case, and as respect for archæology may entail an expense of a few pounds, it is not recognised in the arrangements. One of the aldermen, when the letter from the Society of Antiquaries was submitted, said that "the baths committee were quite able to look after their own interests"—an ominous expression, which probably means further sacrifices of antique work in Bath, with architects as the directing operators.

ON Saturday the French Académie des Beaux-Arts distributed the money available for the Prix Bordin in a novel manner. It was found that none of the work submitted was worthy of the prize. Accordingly it was decided to give a part, amounting to 2,000 francs, to M. PAUL RICHER as a reward for his book, "Anatomie Artistique." M. ROCHEBLAVE was awarded 500 francs for his monograph on "Les Cochin," which was noticed at some length in *The Architect*. M. CHARLES YRIARTE obtained a similar sum for his work, "Matteo Civitali." The recompense of the Académie will be advantageous to the authors, as it is a recognition of the merits of their works.

MONUMENT TO LORD PRESIDENT INGLIS.—ST. GILES'S CATHEDRAL, EDINBURGH.

SHIREOAK, HEADINGLEY.

THIS house, for Mr. J. E. BEDFORD, is now named Arncliffe, and has recently been built at Headingley, near Leeds. It was planned at an angle so as to obtain the best view, as shown on the plan. It is built of specially made small red bricks and the roof is covered with Yorkshire stone slates of a most beautiful colour, in varying tones of grey, yellow, red and blue. The surroundings of the house have been carried out rather differently since this drawing was made. A higher terrace wall of pierced brickwork runs along the front with three steps up into the forecourt. A curved exedra-shaped wall with stone seat is built on the right instead of the straight one, with steps leading to the garden on a higher level. This garden is laid out in a formal manner with box-edging, and a garden house with curved lead roof terminating the wall before mentioned opens on to it. The hall is wainscotted to a height of 7 feet 6 inches, above which is a beautiful plaster frieze of wild rose modelled by Messrs. TARBURTON and TUGWELL, pupils of Mr. E. J. MAY, who have also worked some charming ornament of honeysuckle and thistle into the beams of the drawing-room ceiling. The dining-room has a beam ceiling which the architect intends painting with a sprinkling of flowers.

Messrs. THOMPSON & SONS built the brickwork, Mr. MAWSON made the woodwork; and Mr. STORY, Mr. BRANTON, Mr. HEPTONSTALL and Messrs. PICKLES BROS. were the plumber, plasterer, painter and slater respectively. The architect is Mr. F. W. BEDFORD, of Leeds.

THE OLD GARDENS, HEADINGLEY.

THESE houses are built on the site of the old Botanical Gardens at Headingley, near Leeds. The old bear-pit belonging to the Gardens still remains close by. In planning these houses it was endeavoured to get a decent hall to each house instead of the narrow passage generally found in houses of this size near Leeds. These halls are panelled to a height of about 7 feet 6 inches, and one has a little ingle-nook. They are built of specially-made small red bricks, and the upper walls are tile hung. Mr. CHAS. MYERS was the contractor for the bricklayer's work, Messrs. TOMLINSON & SON, joiner's, and Messrs. WATSON & WORSNOP, tiler's, all of Leeds. Mr. F. W. BEDFORD is the architect.

LAST week we gave an illustration of the upper hall of the Battersea Polytechnic. The whole of the fibrous plaster in the hall was modelled and supplied by Mr. Gilbert Searle, of 14A George Street, Camberwell.

THE STUDY OF ARCHÆOLOGY.

AT the luncheon which was given to the members of the Yorkshire Archæological Society in the De Grey Rooms, York, the Archbishop of York presided. In the course of his speech His Grace said:—

There were few things which interested him more than what he read of that and similar societies in other parts of the country. The work which they had chosen formed one of the most interesting by-paths of life. It embraced a very wide field, as one could see from a perusal of the list of publications issued year by year under the auspices of archæological societies. It ranged over enormous ground in point of area and over vast periods in point of time. He observed that among the many other matters of deep interest which formed the subject of those papers, one writer had found time and had thought it to be of sufficient interest to give an account of the long contest between the provinces of Canterbury and York with regard to their national precedence. That paper he should naturally read with very great interest. It had been said by Pope that "The proper study of mankind is man." That covered, he thought, the whole ground of their proceedings, for although they did not deal with man in his physical constitution or in his moral character, they did deal with him in his social development and in the progress of his civilisation. It was sometimes said that archæology was still in its infancy, and no doubt that was true. He presumed that in their case, as in most other similar cases in the world, the attainment of one object only opened out avenues of project for future objects to

be attained, and they would not soon come to an end even of the objects in the one county of Yorkshire which might profitably engage their attention. The history of archæology was not written in books but in stones, in unattractive mounds of earth and in rough and rugged implements of earlier ages, and in all those details which helped so greatly to give us an insight into the social condition of our forefathers in past centuries. The way in which archæology was now regarded was very different from that which was the case some fifty years ago. In those days an archæologist was regarded as a faddist, and when he was seen digging in some unprofitable-looking mound of earth, or excavating where nothing apparently was to be found, his proceedings were watched with a quiet smile very nearly approaching to contempt. That time had passed, and archæology was being estimated more and more at its true value. On the other hand archæology itself had made great advances. He thought they had escaped from the region of wild guesses which characterised some of the earlier inquiries of archæologists. There was an instance described by Sir Walter Scott in "The Antiquary," where the wonderful discovery made by that learned personage was overthrown by his humble follower with a very simple explanation. The days were past when a story like that had any appropriateness. Archæology had become a little more humble, a little more guarded in its conclusions, and therefore a great deal more accurate; and the accuracy of the conclusions of archæology was one of the most important features by which it ought to be characterised. While it was said that archæology was still in its infancy, he thought in their case the infant was vigorous, healthy and happy, and gave promise of prolonging a useful life. He was told that their prospects of success had very reasonable ground to rest upon. The balance at the bank was greater than had ever been the case before, and the number of members was larger than in any previous year. There seemed to be no lack of interest in the Society as shown by the increasing number of members, and there was no lack of objects with which to engage the attention of those who were brought to join the Society. As he went about the county he often came upon tracks of their work, and found interesting results of their inquiries. The pursuit which they had taken up was not, of course, remunerative in the ordinary sense of the word, but it produced what was far better than money. It produced objects of interest, the study of which could not fail to enlarge and elevate their thoughts as they occupied themselves with them, and it contributed to an increase of the knowledge which they possessed of times which, though long gone by, were never more interesting to succeeding generations than they were to those of the present day. The love of past days was growing upon us continually, and in that he thought they saw a sign of the stability of their national life, that they were not tossed to and fro with every whirlwind of revolutionary doctrine, but to apply words that were spoken in a higher and holier sense, they were glad to stand in the old ways and ask for the old paths. And to find out these traces of their ancestors, to study the works left behind them, and bring themselves into sympathy with their manner of life was surely one of the most interesting occupations which as a by-work and a pleasurable pursuit could possibly fill their minds.

MEDIÆVAL GUILD BOOKS.

A PAPER on "A Beverley Guild Book" was read by Mr. A. Leach at the meeting of the Yorkshire Archæological Association. The interest of the book, he said, largely depended on the fact that a similar one existed in York, and that they mutually illustrated each other. The interest of both lay in the light they threw on town life in the centuries before the Reformation, which, it must be remembered, effected a revolution among civil hardly less than among religious communities, and particularly on that remarkable development of community life in towns, the Corpus Christi play, the earliest extant product of the English drama, which found its highest perfection at York, and of which York had furnished at once the earliest and the most extant version. In one of the books exhibited by the Corporation in illustration of the history were enrolled the ordinances of craft or trade guilds, arbitrations in disputes, &c. The book belonging to Beverley was of the same kind, and began at the same date. He would not trouble them with any of the entries, merely remarking *en passant* that they showed a far greater regard to the public health on the part of the local authorities, and far more severe measures taken against offenders, than municipalities exercised in these days when they could only act under powers niggardly delegated by the central power. On the other hand, they showed a fussy interference with trade in the interest of monopolies. The most striking result of the contents of the book was that the two chief tests and manifestations of corporate life were the par-taking in the Corpus Christi play and the procession on "Cross Monday," otherwise, the Monday in Rogation week.

THE TRUE PRINCIPLES OF POINTED OR CHRISTIAN ARCHITECTURE.

By A. WELBY PUGIN.

(Continued from page 45.)

THE ancient paving tiles are quite consistent with their purpose, being merely ornamented with a pattern not produced by any apparent relief, but only by contrast of colour; and carpets should be treated in precisely the same manner. Turkey carpets, which are by far the handsomest now manufactured, have no shadow in their pattern, but merely an intricate combination of coloured intersections.

Pattern of Ancient Paving Tiles.

Modern upholstery, again, is made a surprising vehicle for bad and paltry taste, especially when anything very fine is attempted.

To arrange curtains consistently with true taste, their use and intention should always be considered: they are suspended across windows and other openings to exclude cold and wind, and as they are not always required to be drawn, they are hung to rings sliding on rods to be opened or closed at pleasure: as there must necessarily be a space between this rod and the ceiling through which wind will pass, a boxing of wood has been contrived in front of which a valance is suspended to exclude air.

Now the materials of these curtains may be rich or plain, they may be heavily or lightly fringed, they may be embroidered

ANCIENT CURTAIN HANGINGS.

dried, is quite contrary to the use and intentions of curtains and abominable in taste; and the only object that these endless festoons and bunchy tassels can answer is to swell the bills and profits of the upholsterers, who are the inventors of these

MODERN UPHOLSTERY

extravagant and ugly draperies, which are not only useless in protecting the chamber from cold, but are the depositories of thick layers of dust, and in London not unfrequently become the strongholds of vermin.

Modern Fringe, composed of turned pieces of wood.

originally nothing more than the ragged edge of the stuff tied into bunches to prevent it unravelling further. This suggested the idea of manufacturing fringe as an ornamental edging, but good taste requires that it should be both designed and applied consistently.

In the first place, fringe should never consist of heavy parts, but simply of threads tied into ornamental patterns.

Secondly, a deep fringe should not be suspended to a narrow valance.

Thirdly, no valance should be formed entirely of fringe, as fringe can only be applied as an ornamental edging to some kind of stuff.

Ancient Fringe, composed of threads.

A Modern Valance of Fringe.

Fourthly, fringe should not be sewed upon stuff but always on the edges. It is allowable at the very top, as it may be supposed to be the upper edge turned over.

But to return to metal-work. We have in the next place to consider the use of cast-iron. When viewed with reference to mechanical purposes it must be considered as a most valuable invention, but it can but rarely be applied to ornamental purposes.

Iron is so much stronger a material than stone that it requires of course a much smaller substance to attain equal strength; hence, to be consistent, the mullions of cast-iron tracery must be so reduced as to look painfully thin, devoid of shadow and out of all proportion to the openings in which they

with heraldic charges or not, according to the locality where they are to be hung, but their real use must be strictly maintained. Hence all the modern plans of suspending enormous folds of stuff over pots, as if for the purpose of sale or of being

are fixed. If to overcome these objections the castings are made of the same dimensions as stone, a great inconsistency with respect to the material is incurred; and what will be a much more powerful argument with most people, treble the cost of the usual material.

Moreover, all castings must be deficient of that play of light and shade consequent on bold relief and deep sinkings so essential to produce a good effect.

Cast-iron is likewise a source of continual repetition, subversive of the variety and imagination exhibited in Pointed design. A mould for casting is an expensive thing; once got, it must be worked out. Hence we see the same window in greenhouse, gatehouse, church and room; the same strawberry leaf, sometimes perpendicular, sometimes horizontal, sometimes suspended, sometimes on end; although by the principles of pure design these various positions require to be differently treated.

Cast-iron Mullion. Stone Mullion.

Cast-iron is a deception, it is seldom or never left as iron. It is disguised by paint, either as stone, wood, or marble. This is a mere trick, and the severity of Christian or Pointed architecture is utterly opposed to all deception; better is it to do a little substantially and consistently with truth than to produce a great but false show. Cheap deceptions of magnificence encourage persons to assume a semblance of decoration far beyond either their means or their station, and it is to this cause we may assign all that mockery of splendour which pervades even the dwellings of the lower classes of society. Glaring, showy and meretricious ornament was never so much in vogue as at present; it disgraces every branch of our art and manufactures, and the correction of it should be an earnest consideration with every person who desires to see the real principles of art restored.

I will now briefly notice the exquisite productions of the ancient gold and silversmiths. As reformers and puritans have left us nothing but the mere name of the glorious shrine and ornaments which formerly enriched our cathedral and other churches, and as revolutionary and heretical violence has been almost equally destructive on the Continent, were it not for a few places which have preserved their ancient treasures, we should be unable to conceive half the art, half the talent, half the exquisite beauties of this class of ecclesiastical ornaments.

ALMERY IN A RELIQUARY CHAMBER.

In the sacristy of Aix-la-Chapelle is a treasury of inestimable value, consisting of shrines, reliquaries, crosses, crowns, ampuls, chalices, pyxes, books of the Holy Gospels, paxes and enamelled images of silver, all executed during the finest periods of Christian art, the richness of their material being only surpassed by that of their design. To enumerate even a tenth part of these wonderful productions of the goldsmith's art would occupy far too much time for my present purpose, but I will make a few remarks respecting them to illustrate the purpose of my lecture.

Their construction and execution is decidedly of a metallic character. The ornament is produced by piercing, chasing, engraving and enamel; many of the parts were first formed in thin plates of metal and then shaped by the pliers. Engraving is a style of ornament peculiar to metal. The old goldsmiths were undoubtedly the inventors of our present engraved plates for printing. They increased the effect of the ornamental engravings by hollowing out the ground in certain parts and filling it in with coloured enamels. The engraving of an ancient

pyx* will show the style of working silver, as practised during the Middle Ages. There are some exquisite examples of chalice feet enamelled with sacred subjects in the sacristy of Mayence Cathedral, and a circular reliquary at Aix, which Dr. Rock considers to have been used as a pax, which is a transcendent specimen of the art of enamel. The covers of the great books of the Holy Gospels were enriched with chasing, enamels and even jewels—the crucifixion of our Lord in the centre, and the emblems of the Evangelists at the corners of an elaborate border. Precious stones of every description were studded on these ornaments, which presented a wonderful combination of richness and beauty, produced by gold enamel of various hues and sparkling gems, arranged with the purest design and most harmonious effect. As it would occupy a whole work to illustrate these objects separately, I have endeavoured to convey some idea of their beauty by the annexed engraving of a reliquary chamber (see preceding page).†

Images of silver gilt.

These treasures, which Aix now alone possesses, were by no means superior to many of those splendid ecclesiastical ornaments formerly to be found in all the large churches of this land, but which fell a prey to the rapacious tyrant Henry and his abettors in the general wreck of faith and art at the period of his lamentable scism.

Silversmiths are no longer artists; they manufacture fiddle-headed spoons, punchy racing cups, cumbersome tureens and wine-coolers; their vulgar salvers are covered with sprawling rococo, edged with a confused pattern of such universal use that it may be called with propriety the Sheffield eternal. Cruet-stand, teapot, candlestick, butter-boat, tray, waiter, teacup are all bordered with this in and out shell-and-leaf pattern, which, being struck in a die, does not even possess the merit of relief. Like everything else, silver-work has sunk to a mere trade, and art is rigidly excluded from its arrangements.

Iron-smiths were artists formerly, and great artists too; Quentin Matsys, for instance, whose beautiful well-top stands in front of Antwerp Cathedral, and whose splendid picture of the entombment of our Lord is the greatest ornament of the Musée of that city. Quentin Matsys are not, however, of our generation; if you want some objects executed in iron rather different from what are in ordinary use, and go to a smith to whom you explain your wishes and intentions, the vacant stare of the miserable mechanic soon convinces you that the turning up of a horse-shoe is the extent of his knowledge in the mysteries of the smithy. You then address yourself to another, and one who is called a capital hand, and if he be sufficiently sober to comprehend your meaning, he will tell you that what you want is quite out of his line, that he only makes a particular sort of lock, and that he does not think there is a man in the trade who could undertake the job, which, after all, is perhaps a mere copy of a very ordinary piece of old ironwork, and this is a true picture of the majority of our artisans in the nineteenth century, the enlightened age of mechanics' institutes and scientific societies.

Mechanics' institutes are a mere device of the day; the Church is the true mechanics' institute, the oldest and the best. She was the great and never-failing school in which all the great artists of the days of faith were formed. Under her guidance they directed the most wonderful efforts of her skill to the glory of God, and let our fervent prayer ever be that the Church may again, as in days of old, cultivate the talents of her children to the advancement of religion and the welfare of their own souls, for without such results talents are vain, and the greatest efforts of art sink to the level of an abomination.

(To be continued.)

ART IN THE FLOOR-PLAN OF A BUILDING.

THERE seem to be two mistaken tendencies in our American methods of architectural education; on the one hand, to teach architects in a scientific or literary way; on the other hand, to teach with an absolute disregard for the proper and legitimate methods of work and study in our art, as if these methods were inartistic. Our methods of study should be as peculiar to us as those of the sculptor, painter and musician are to them.

The one class of men with whom we have to contend includes those who would dispense with the triangle, compass and T-square, and with such familiarity with the orders and with the principles of composition as will enable the student to use them with the utmost facility. They neglect these things, forsooth, to make room for what they call clever sketching. These men seem to have a peculiar disdain for the legitimate means of study, as though they were inartistic. The other class of men, the pretended *savants*, would learn their profession as though a good knowledge of the history and literature of their art, with a course of general lectures, were all-sufficient if followed by a few years of practical office experience. To the so-called *savants*, or the men who would teach architecture only in scientific or literary ways, it should be said that architecture is an art rather than a science, and that when the architect is most skilled in his art, then he has least need of recourse to science. Of course an architect must be familiar with descriptive mathematics for the purpose of calculating the intersection of vaults, roofs and various problems in stereotomy. Yet, if the floor-plan has been well studied from an artistic or æsthetic point of view, there will rarely be left other difficult engineering and mathematical problems for the architect to solve. Here is the key to the entire problem.

I shall first endeavour to make clear the fact that there is such a thing as art in the floor-plan. There seem to be few architects in America who realise that the floor-plan is anything more than a mere matter of the convenient arrangement of the several parts of the building. A good floor-plan, as seen

* Paper by Mr. Thomas Hastings, published in the *Engineering Magazine*, New York.

on paper and before examining into the questions of arrangement, has proportion, form, scale, colour, values and character. The drawing of the plan will awaken as much enthusiasm in the educated architect as does the picture in the painter, or the statue in the sculptor. This plan should be thoroughly studied and practically finished before the architect has more than a vague idea of the design of the exterior of the building. The plan involves and determines the entire composition; the silhouette or outline of the whole structure is really projected on the plane of this drawing—*i.e.* the thickest walls and the heaviest piers are the portions of the outline of the building which go the highest, for the silhouette is the necessary outcome of the artistic relations of these different wall and pier thicknesses to each other. We know that when a pier is 5 feet square in plan, whether it is the foundation of a tower or the foundation of one of the corners of a dome, it must go higher than the wall next to it, which is only 2 feet thick. The relations of the wall to the pier must look well on paper. If the proportions and the relations of the walls to each other are good, the silhouette will prove to be good when seen in perspective after the building is complete.

The floor-plan determines the entire composition, and it does away with the perspective drawing as a help to architectural study, and leaves it no place except to explain a building to a layman. It is amateur-like to use the perspective for any other purpose. When the plan is well studied, then it constructs well and builds well, and we need very little of the analytical mathematics to assist us in our construction.

Until modern times, how much mathematics (besides geometry and the descriptives) did architects know, as compared with what we are given to learn, and what did they know of the strength of materials? With them it was mostly a question of good judgment, with a proper and uncommon understanding of constructive principles, and of stereotomy and the other descriptive mathematics. Analytical mathematics is comparatively a modern science. While, for example, there existed graphical rules for the approximate determination of the thrusts from arches as early as the thirteenth century, yet it is practically only within the past fifty years that the correct principles of analysis have been fully developed, and there is still room for improvement in this direction. Until recently architects probably never calculated the strength of their materials, or the thrust of arches and vaults. With them it was a question of intelligence and not of ingenuity. It was the qualitative rather than the quantitative principles of construction that they studied, and these always based upon experiment or experience. It was by knowing how to avoid difficult problems with art in the floor-plan that they escaped having difficult analytical problems to solve. We must always give precedence to practice and truth before laws and theories.

To illustrate this principle, there may be many arches indicated in a well-studied plan; but the thrust of each is received, either by an equivalent thrust in the opposite direction or by a solid masonry wall, in line with the direction of the force, to buttress the arch.

In a well-studied floor-plan there will always be artistic reasons for making a pier economical in size and strong enough to support the weight that it has to carry. By pure mathematics we can only approximately determine what should be the size of a pier. The strength of materials must be estimated. We select at random several specimens of the stone to be used in our building. We obtain crucial tests from a machine designed for this purpose, and so we are supposed to learn from these few specimens the average weight per cubic inch which the stone will support. This we call our co-efficient of strength in the stone chosen for our building. Taking into the account the fact that the quarry where the stone is obtained may have a great fissure running through it, or may have other imperfections, the mathematician enters upon his calculations to learn how large a pier built of this stone should be to support the weight that is to be above it. After this the architect practically admits the inexactitude of his premises by increasing two or more times the size of the pier and calls this the factor of safety or ignorance. I believe in such calculations for purposes of verification, but in general the piers will be about as safe to build upon when studied by an educated architect as when calculated by engineers.

It is really architecture and well-proportioned masonry *versus* engineering and the iron girders. Each has its use, but they are not interchangeable. Buildings have stood for centuries, and this is solely because their plans, as seen on paper, were so well studied, so thoroughly artistic and beautiful, that constructive difficulties were avoided.

Now that photographs and illustrated books are becoming so accessible to the student, adaptation is a greater temptation to us than ever before. We compile more than we compose, but if our floor-plan is first thoroughly studied in an artistic way to meet the practical requirements of the problem in hand, then, when interpreting this plan and designing the façade, we can neither copy nor adapt what was conceived for one thing, making it serve the purpose of another.

We must not disparage analytical mathematics for purposes of verification. So long as a great many inartistic buildings are put up, such verification is needed for the protection of human life. From innumerable buildings time makes its selection, but at the sacrifice of human life in those which fall, because the inartistic buildings were not subjected to analytical verification. But this kind of verification, especially in complicated and exceptional cases, should always be entrusted to experts or specialists. Of course there are exceptional and most unfortunate conditions imposed upon us in these days, under which conditions the plan has but a very small part to play in the solution of the problem, such as 15-storey office buildings on 20-foot lots. Here all would agree that expert mathematicians and engineers should be called into consultation, just as they are called in for questions of steam-heating, ventilation or electrical work. But with these exceptions in the well-studied floor-plan, the constructive problems solve themselves, so that we do not have to resort either to calculation or to mere ingenuity. The plan determines every perpendicular line, so that it is, in fact, almost impossible to build a structure that is absolutely unsightly on a well-studied, well-proportioned plan. The thicknesses of walls and piers should be proportionately related to the spans of the arches or to the distances and floor-spaces. The thickness of a column should be proportioned to the intercolumniation or distance between columns, and the whole should be looked upon almost as you would look at a drawing in black and white, the black portions of the plan indicating the walls and piers, the largest going the highest in the elevation. Therefore, the more art we have the less science we need. When a floor plan has been thoroughly studied, then in developing the exterior or interior no changes will be needed even in details. We shall be saved from adaptation instead of composition. In the further development of the scheme we need only fill our minds and hearts, however large, with the spirit, the ideas and the sentiments of our age, and study and interpret the plan in order to reach the best results. Thus art in the plan is the first great need.

In the schools where architecture is taught in the United States the lecture-room plays too important a part. The architect or professor who teaches does not come enough into personal contact with the student to criticise his work, and the advanced students are not enough in contact with the beginners, as is universally customary in the ateliers or the studios of Europe.

To the men who disdain these true methods of study because they think them inartistic I would say that we do too much mere sketching and not enough serious studying. The architect should not despise the T-square and the triangle any more than the musician should despise the key-board of his piano. Sketching plays a very minor part in architecture; yet how many architects feel, if they can make a clever sketch, that they are skilled in their profession. An architect's drawings should be looked upon only as architectural—merely as means to an end—and yet they need be none the less artistic and fascinating to the architect.

The architect should design in plan and not in perspective. The day is coming when the public and all honest critics will demand of design in architecture something more than mere taste and refinement of details; when the monument must be something more than a conglomerate of well-moulded garlands, wreaths and ribbons, well-proportioned windows and columns, or the use of materials fine in texture and colour; and this can only be when the plan is looked upon as something more than merely a question of convenient arrangement, and the picturesque as something more than an eccentric accumulation of accidentals and good details.

I would not be misunderstood. I would not disparage the thorough study of the plan from a utilitarian point of view. This is in fact the principal channel through which our life and habits influence our composition and style. Before beginning to study the general composition of the floor-plan, it is first necessary to reduce the problem to its simplest form from a utilitarian point of view, taking into account the number of the principal rooms or divisions and the use that they are to be put to, their sizes and the most reasonable forms that should be given to them. This is, as it were, the theorem or the programme of the composition.

If the question of disposition is not thus thoroughly understood at first it will arrest the freedom of the mind and the imagination.

Of equal importance is the question of the position or site of the building and the principal points from which it will be seen. Certain distributions of the several parts of the building that would be well for a low and flat country would be inappropriate for a hill. The streets, promenades or squares, or possibly water—river, lake or sea—should of necessity have a great influence upon this distribution. The architect should know how to dispose his masses and should calculate the different effects with these conditions of environment taken into the account; that is to say, the principal room may demand a certain outlook, and perhaps some other rooms must be seen

from a given point of view. The plan which does not satisfy all such given conditions is not only impracticable, but must in consequence thereof be absolutely inartistic, for a good building must have obvious adaptations both to its uses and to its environment. These things must of necessity influence the general character of the design.

In general it may be said that there are three kinds of floor-plans—the regular, the irregular and the picturesque. A monumental floor-plan is always regular, unless the peculiarities of the site make this impossible. The regularity consists in the plans having one principal axis. The irregular plan is an adaptation to the imperatives of an irregular site. It secures as much symmetry in the arrangement of its parts and proportions as the limitations of the site permit. The picturesque plan is not merely eccentric or lawless, but is an attempt to conform to the picturesque conditions of the environment, at the same time preserving as much of balance and symmetry in the details as such adaptation will allow.

The general form may be as irregular or unbalanced as the letter L, and yet have perfect symmetry and circulation such as will give interesting vistas in every direction. The general principles of composition are the same as in the case of a regular plan.

Having considered the plans of buildings, we come now to speak briefly of the plans of the immediate surroundings, which the French call the *plan générale*. They have a very characteristic name for this portion of the composition, which is the "saucé of the architecture." It is this portion of the design which unites or marries the building with its natural surroundings or the landscape. Most of the same principles of composition obtain in the planning of this portion of the work as in the planning of the building itself. The silhouette must make first of all an agreeable *ensemble* with the silhouette of the building. If the surroundings will allow it the building should be so placed as to have the greater portion of the grounds on one side of it. This is generally very desirable, and especially when the site is small in proportion to the size of the building. The object is to give a large and open space on this one side, instead of a small frame or fringe all the way around it. This is not only true in the case of a public building, but it is just as true in the case of a dwelling. It would seem as though this were a mere question of common sense, and yet how little the principle is recognised, how dreary are the suburban homes of the poorer classes in this country. It is mainly because a man, when he builds, places his small square house in the centre of a square lot, with a square walk around the house and a fence that forms a square around the walk; and, as though this were not enough, even the streets all form squares outside his lot.

While the landscape or surroundings should govern the general composition of the building in the beginning, the building should in turn, when completed, influence and govern the arrangement and composition of that portion of the landscape work which comes in immediate contact with it. This landscape work is to surround and to support the building, serving both as frame and as pedestal. The accessories of the architecture, such as the terraces, balustrades, paths, fountains, open spaces and vistas which come nearest to the building, and other architectural features, are really a part of the building.

While the plan of the surroundings does not need to repeat the form of the building itself, it should everywhere recall its principal axes and lines, and it should accentuate its general silhouette, just as where there is a pavilion or important feature in the building there should be a circulation in the surroundings leading up to it.

Fountains, balustrades, statues and rows of trees, when desired, should be clearly indicated in plan. All these things, with the plan of the building itself, should hold together in one great *ensemble*, while there may be interesting detail in the form of niches in the verdure for statues or recesses for seats or vases, and small round or square breaks taken off the angles where two paths meet. All these forms should be studied in almost exactly the same way as if they were in the plan of the building itself. A statue should rarely be placed in the middle of a lawn, but either in a recess or in the centre of a square at the intersection of an axis with the circulations. The size of the statue, as represented by its pedestal, has a proper relation to the other surroundings and to the plan of the building. A statue generally looks better in a public square with an architectural background or in a formal garden in a recess on either side of a main avenue, with thick foliage behind it, instead of standing against an open sky. Generally speaking, therefore, it is best to keep statues out of the large parks which are more apt to be naturalistic and put them in the small parks.

Something should be said with reference to the general plan of cities, that is, the laying out of streets, avenues or parks.

The planning of a city is rather an evolution in history than the work of an architect, and so gives valuable testimony to the different phases of the life of the people. Many of the most interesting souvenirs of the past are seen not only in the build-

ings and monuments, but also in the general disposition of the streets and public squares. How much art, however, may be displayed in the influencing of this evolution can be seen by looking briefly at some of the cities of modern times. The greater portion of every city is the result of the accumulated works of generation after generation. This development is determined by local circumstances, by the political constitution and by the commercial and domestic life of the inhabitants.

But happy is the city whose development in the cutting of new avenues and the building of new squares and parks has been governed by the laws of art. In a general way, the cities which have most impressed us are those that have at least one great artery running through the interesting confusion and natural complication of its streets. For example, how much more lasting is our impression of Paris than of London. When we think of Paris, we first see that one main artery with which we associate the great composition spread out before us when standing on the Place de la Concorde. On one side are the garden of the Tuileries and the court of the palace of the Louvre. In front of us is the magnificent avenue of the Champs Elysées, which terminates with one of the greatest triumphal arches ever built. To the south is the river Seine and the beautiful bridge leading to the monumental portico of the palace of the Corps Législatif. To the north, those two most splendid buildings of simple and vigorous proportions the Garde Meuble, and between these the vista of that wide avenue leading to the façade of the Madeleine. In the centre of the Place de la Concorde is an Egyptian obelisk; in the axis of the main circulation there is a large fountain on either side and in axis with small circulations from the corners of the square; in different parts of the composition are colossal statues and a multitude of candelabra. All these things enter into the composition of what I would call the main artery of the heart of the city—one of the greatest plans that the world has ever seen. All this is in striking and interesting contrast with the rest of the city, which is so complicated that it seems utterly devoid of any plan and to be the result of mere accident. And yet all this confusing complication is the outcome of most serious consideration in the history of the city.

What impressions to compare with this have we of London, where almost all seems to be confusion, and what is our impression of New York as to its general scheme, where there is no interest either of contrast or of confusion? Rather the greater part of the city is laid out in monotonous squares like a checker-board, without any street or avenue leading up to any monument or other object of interest and with the circulation in only two directions. It does seem that every modern city might have one great artery or central avenue, and as though it might be possible to avoid prolonging streets to an indefinite length without leading up to anything.

The New York Municipal Government has now in hand a most interesting opportunity to display artistic skill and to illustrate some of these principles by the selection of a site for the new city hall. Instead of crowding a small park or open space with a large building which would be entirely out of scale with its approach or surroundings, they should select a site in an inexpensive neighbourhood, which should be near enough to Broadway to allow of the widening of a cross-street to lead up to the centre of the building, as was done in the case of the Rue Soufflot in Paris, which leads up to the Panthéon, thus making the widened cross-street a short avenue of approach to the central motive of the building. This building would soon change and determine the character of its surroundings and so increase the value of adjoining property.

Thus it may be seen that the same principles which apply to the most unimportant plan apply also to the monumental building, and to the general plan of its surrounding as well as to the cutting of streets and the laying out of a city.

INSIGNIA AND PLATE IN YORK.

A PAPER on the "Insignia of the City of York" was read by Mr. W. H. St. John Hope at a conversazione held during the meeting of the Yorkshire Archaeological Society. He said that the insignia of the city of York, if unable to compare in quantity with those of Bristol or Hull and some few other places, certainly yielded to none in their extreme historical interest and artistic value. They consisted of two swords, a cup of maintenance, a great mace and four sergeants' maces, gold chains for the lord mayor and the lady mayoress, a lady mayoress's staff, a chain and badge for the sheriff, three ancient livery collars and badges, a porter's staff and a most interesting group of seals. The city was also in possession of a very fine collection of plate, including a gold loving cup, another silver gilt, a basin and ewer, two of the curious punch bowls called monteiths, three tankards, a pair of posset pots, a silver chamber-pot and various articles of table use chiefly modern. The special privilege which was shared by some five-and-twenty other cities and towns of having a sword

carried before the mayor was conferred upon the city of York in 1396 by Richard II., who granted and confirmed to the citizens and their successors for ever "that the mayor of the said city and his successors for the time being may have carried or may cause to be carried before them their sword which we gave them, or any other sword they please, out of the presence of us and our heirs with the point erect, both in the presence of other magnates and lords of our kingdom of England." According to Drake "the sword was given by the king on his visit to York in 1388, when King Richard took his sword from his side and gave it to be worn before William de Selby as first Lord Mayor of York." Drake described four swords as belonging to the lord mayor during his office. The first of the swords and the largest was the gift of the Emperor Sigismund; another given by King Richard II., from which the title of lord accrued to the chief magistrate of York. This was the least sword among them, but the greatest in value for the reason stated. A third was that of Sir Martin Bowes, Lord Mayor of London, which was the most beautiful. The fourth was formerly made use of every time the lord mayor went abroad. The sword given to the city by Richard II., and which one would have regarded as one of the city's most cherished possessions, had now disappeared, no one seemed to know when or whither. It was in existence certainly down to 1796. Of the remaining swords, the oldest and largest was an exceedingly fine example of the early part of the fifteenth century. This sword was of exceptional interest as being the one hung up, according to custom, over the stall of the Emperor Sigismund in St. George's Chapel, Windsor, on his election as a Knight of the Garter in 1416. After the emperor's death in 1437 it became the perquisite of the dean and canons of Windsor. According to a contemporary record in the city archives it was given by the dean of Windsor to one of the canons, who was also a canon of Howden and rector of Middleton, near Pickering, and a native of York itself, and by him presented to the city in 1439, to be carried before every successive mayor. For how long before the granting of the charter of 1396 a mace or maces were borne before the mayor and sheriffs of York was uncertain. The lady mayoress's gold chain of office was given by Marmaduke Ramsden, of London, in 1670. The common seal of the city of York was a fine double one of silver, of thirteenth-century date, and was still in use. The mayor's seal was of late fourteenth-century date. The silver seal of the "statute merchant" was likewise in the possession of the city. The "king's seal" was of the usual type, with the king's bust with the lion of England in base between two castles. The seal had, however, this peculiarity, that the under castle was movable, probably to enable other devices to be substituted for it, though none such now existed.

A paper on the "Corporation Plate," by Mr. T. M. Fallow, F.S.A., was also read. He said that the city of York was fortunate in possessing so fine and interesting a collection of plate. From an examination of the city records, it would seem that prior to the year 1558 the city did not possess any plate proper; but in that year Sir Martin Bowes presented to the Corporation a silver basin and ewer, parcel gilt, which formed the nucleus of the subsequent collection. Other valuable pieces of plate were acquired by gift and bequest during succeeding years, but at a meeting of the Council held on February 7, 1643-44, it was resolved that the city, being 500*l.* in debt, two of the aldermen should view the city's plate and certify to the next court what they thought fitting to be sold and what it would fetch. In the next minute of the Council, bearing date February 16, the order for the sale of certain pieces was recorded, and in that way the city got rid of the basin and ewer given by Sir Martin Bowes; also those given by Mr. Thomas Metcalf, of London, as well as of some eighteen other vessels. Drake, in "Eboracum," gave a list of the plate existing in 1681, some seventy pieces in number. Of these, eight still remained, and twenty-six others in some other form, the result of exchange or refashioning. Mr. Fallow proceeded to describe some of the pieces, including the Turner standing cup, the rose-water basin and ewer, tankards, monteiths, posset-cups, waiters, the centre-piece, consisting of a domed temple with the statue of Justice within, &c. The most valuable, and one of the most interesting, of the pieces of plate was, he said, the loving-cup of solid gold. It was an ordinary shaped goblet with a baluster stem, being 9½ inches in height and weighing 26 ozs. 13 dwt. The inscription was as follows:—"The gift of Marmaduke Rawdon sonn of Laurence Rawdon late alderman of this city, Ano. 1672." It bore three hall-marks, one of which was a capital italic "P," the old York letter for 1672-73. Gold plate—that was, plate made of solid gold—was exceedingly rare at the present day, and he knew of only one other gold cup in Yorkshire. The loving-cup of the York Corporation was unique, so far as he knew, in being the only instance of a piece of gold plate bearing provincial hall-marks, and the city of York might well be proud of possessing it. Mr. Hope told him that among collections of plate belonging to the corporations of England, there were, so far as he knew, only two pieces of gold plate.

DRURY LANE THEATRE.

A GENERAL assembly of the Theatre Royal Drury Lane Company of Proprietors was held at the saloon of the theatre on the 18th inst. The report of the committee showed that the gross receipts, including balance from last year of 1,103*l.*, had been 8,500*l.* The payments had been 6,238*l.*, leaving a balance of 1,262*l.*, while a further sum of 1,000*l.* had been laid out in the purchase of 1,002*l.* 2½ per cent. Consols, in addition to 3,000*l.* laid out the previous year. The company had agreed with the lessee for the sale to him of the residue of their term, together with the patent and chattels, for the sum of 5,000*l.* The Duke of Bedford had agreed to release the company from all claims to dilapidations. The Chairman, in moving the adoption of the report, said that the sub-committee had done everything in its power to obtain a renewal of the lease. At that time last year a letter was received from the Bedford office refusing a renewal, and consequently a resolution was passed requesting the Duke of Bedford to reconsider his decision. The Duke had refused to do so, and, in response to an application for a short lease, said that as he was only the tenant for life it would be impossible for him to grant one except at a rack rent. The committee had agreed to sell to Sir Augustus Harris the lease for the remainder of their term. The motion was seconded by Mr. Edward Chitty, who complained that, although the proprietors had spent over 300,000*l.*, of which they had not had a penny return, their property had been practically, though no doubt legally, confiscated, and they were not even granted a short lease in order that they might recover something. The report was adopted.

CAISTER CHURCH RESTORATION.

A PARTY of ladies and gentlemen, the *Norwich Mercury* says, mostly Yarmouth members of the Norfolk and Norwich Archaeological Society, paid a visit to Caister, and were received by the Rev. E. G. and Mrs. Murrell. The party consisted of the Rev. H. W. Harden, vicar of Hemsby; Rev. C. Whitehead, chaplain of Yarmouth Workhouse; Dr. and Mrs. Adcock, Mrs. Harvey George, Mr. and Mrs. Robert Hewett, Mr. T. Blyth, master of Yarmouth Workhouse; Mr. and Miss McDonnell, Mr. C. Stuart, vicar's warden, and Mr. J. E. Teasdel. The latter, with the rector, first proceeded to the chancel, where a number of specimens of early workmanship were on view, not the least noticeable being the remains of a fine arch, taken out in pieces from the old walls and put together, evidently a portion of the window of the old church. In the south aisle the remains of what was once a small chapel were inspected. In the piscina was an old oak shelf, which Mr. Harden said must have been put there in the fourteenth century, protected by coating of lath and plaster; on being taken out it crumbled away. Two skeletons were found here, Mr. Teasdel said, and from the absence of any sign of a coffin or inscription he thought it not impossible that they were two smugglers who had been buried secretly there hundreds of years ago by their friends. At this point Mr. Teasdel read the following paper on "The Early History of Caister and Church":—

Caister was formerly divided into two parishes, Holy Trinity and St. Edmund's, and they were consolidated on September 22, 1608. The church dedicated to St. Edmund has been suffered to fall into decay, but it can be used as a chapel of ease if needed; but this has rarely been the case of late years. The chancel of the present church was restored in 1852 and the porch was added some time ago, with certain alterations by the present rector. Unfortunately, when the nave was re-roofed, it was not put into its original pitch, as shown by the existing marks on the tower. This was done in 1781. The chancel has a sedilia for three priests and a piscina, also monuments of the Crane and Blennerhessett families. The Mr. Crane here mentioned was the reputed owner of the Star Hotel at Yarmouth, which he built about 1594. There does not appear to be any authentic history of this church. It appears to have been re-erected at some time or other from the ruins of some former church probably now covered by the sea. It is very plain that many alterations have been made to the windows, both in size and position, from time to time, and one in the south aisle has been blocked up. From the appearance of the walls it is evident that the lath and plaster so shamefully put on was put there to cover up certain defects, and the amount of rubbish found used for filling-up purposes is astonishing, most of which is evidently part of some church fabric of early days. With regard to the tower a romance is attached to it which tells of a sailor's bride being buried there. If, however, such a thing did take place, there is no trace of it there now. The lead round the parapet was removed, no doubt by the Puritans, and the elevated roof seen from the road is a small one raised to keep the wet out of the interior of the tower. There is nothing whatever there in the way of a coffin in these days, and he really questioned the whole story, which, no doubt, be-

longed to the folk-lore of the district. The probable date of the building is the fourteenth century, and it is said to have been built by the father of Sir John Falstaff, who lived in 1386 at Yarmouth.

After examining a small Saxon window and parts of the church, a move was made to the churchyard, where the exterior of the tower was examined, and to all appearances the two buttresses rest on two large tombstones, which form a very solid base. The tomb of Sarah Martin, the celebrated prison visitor, was pointed out by the rector. By the kindness of the rector the entire party were entertained at tea at the rectory. After tea some of the party ascended the old tower, the feat being not very easy to perform. Sundry owls were disturbed *en route*, but at last the parapet was reached, an examination of which shows no traces whatever of anything ever having been on it, as alleged. The state of the parapet is very bad, and something will have to be done to secure it, several parts being quite loose and liable to fall during a heavy gale. The company thanked the rector and Mr. Teasdel for their kindness.

IRISH ARROWHEADS.

A PAPER on instruments from the raised beach of Larne and Irish arrowheads was read by the Rev. George Buick at the meeting of the Royal Society of Antiquaries of Ireland in Carnarvon.

In a collection, he said, of Irish antiquities, the department which usually attracts most attention is that containing the arrowheads. This in itself is not to be wondered at. The variety in the forms displayed, the graceful outlines, the differing shades of colour, the marvellous differences in detail despite the general similarity which obtains, and the workmanship, bold and free or delicate and constrained, as the case may be, appeal alike to the eye and imagination of the visitor. Yet, strange to say, no detailed description of these beautiful and interesting objects, save the somewhat imperfect and exceedingly brief one given by Sir William Wilde in the Catalogue of the Royal Irish Academy's Museum, has hitherto been attempted. Ireland is the country *par excellence* of arrowheads. A rough estimate of the number in the public and private collections throughout Ireland shows that they amount to something like 10,000. At least as many more must have been taken out of the country, and when we add to all this the further fact that almost every day numbers are still being turned up from the soil we get a vivid idea of their phenomenal abundance. The majority of these are made of flint. Of arrowheads other than flint there are comparatively few. So far as can be made out the proportion is about one in a hundred. The bulk of these are of pitch stone or basalt. A few are of Lydian stone, and a very few of chert. Those composed of the latter material are chiefly from the sandhills near Bundoran. In size arrowheads range from about 4 inches in length to 1 inch. A medium size is from 1½ inches in length to 2 inches. The workmanship of the arrowheads is something wonderful, considering the nature of the material out of which they are made. The makers of them must have been born artists, with deft fingers and a keen eye for beauty of form. They divide readily into three great classes—the leaf-shaped, the triangular and the stemmed. Each of these has two sub-classes, and these again a number of varieties. This is the best classification to adopt, not only because of its simplicity, but also because it seems most in line with the process of development out of which the typical forms have grown. The sub-classes of the leaf-shaped arrowheads are the leaf-shaped proper and the leaf-shaped modified, viz. the lozenge-shaped and the kite-shaped, produced by altering slightly the edges of the leaf-shaped head. Those of the triangular class are—first, the ones which have a straight base; and second, those which have the base notched or indented. Of this latter sub-class there are some four varieties. The two sub-classes of the stemmed arrowheads are—first, those without barbs; and second, those with barbs. Here sometimes the stem and barbs are of the same length; sometimes the stem is longer than the barbs; and yet again, there is a variety in which the barbs are longer than the stem. Many belonging to all these three great classes are serrated. Of the serration itself there are two kinds—the one the necessary result of the chipping, the other intentionally produced and altogether independent of, and apart from, the original flaking. Two examples only of arrowheads still attached to their shafts have been met with in Ireland. In both instances there was a lapping of gut or sinew immediately below the head itself. Arrowheads are to this day regarded by many of the peasantry as the missiles of elves and fairies. They are also used to cure cattle which are supposed to be bewitched. Instances were given of this and the paper closed with a reference to the remarkable fact that there is no mention of bows or arrows in old Irish writings, though Spenser and other authors of his age speak of them as part of the equipment of a soldier in the sixteenth century.

GENERAL.

Sir Wm. Henderson has presented to the Aberdeen Art Gallery a picture by John Philip, R.A., *A Highland Lassie*, and Mr. Catto a painting of *Morning on the Roman Campagna*, by M. Tiratilli.

Mr. A. E. Collins, of Reading, has been appointed city engineer, architect and surveyor for Norwich, at a salary of 600*l.* a year, by a vote of two over those received by Mr. J. Price, of Liverpool, the difficulty of the Town Council being in distinguishing between the claims of the two gentlemen.

The Egyptian Government invite architects of all nationalities to send plans for the new museum to be built at Cairo. The sum allotted for the building is equal to 123,000*l.* sterling, and plans will be received at Cairo up to March 1, 1895. A prize of 630*l.* will be paid for the best plan submitted, and 420*l.* will be divided amongst the four next in order of merit. Architects wishing to compete can procure details by application to the Ministry of Public Works, Cairo.

Mr. Whistler's *White Girl*, a drawing, was sold on Saturday for 37 guineas, and his *On the Pier* and the *Japanese Parasol* for 40 guineas.

Bishop Hervey has bequeathed all his portraits of the Bishops of Bath and Wells, which are in the picture gallery of the Palace, to devolve as heirlooms with the Palace, but if his successor will not pay the legacy duty the portraits are left in trust for sale. The pastoral staff to the late bishop, the Glastonbury chair and Abbot Whiting's chair are also made heirlooms.

The Jamna Masjid, the principal mosque at Delhi, has been struck by lightning. The dome of the south minaret was injured, but no material damage done to the building.

Herr Karl Roux, a well-known painter of animals and idyllic scenes, and manager of the Picture Gallery at Mannheim, died there of typhus fever on Monday morning.

Mr. W. J. Tennant, architect, Pontefract, has obtained the first premium of 100*l.* in the competition for the market hall and public offices at Goole. The second prize was divided between Mr. Thorp of Goole, and Mr. Alton of Doncaster.

The late Mr. S. Sanders has bequeathed his picture *Tobit and the Angel*, by Elsheimer, to the National Gallery; his picture *Faith, Hope and Charity*, by Rubens, to his wife for life, and then to the Fitzwilliam Museum, Cambridge.

A Statue of the late Cardinal Newman, which will have a canopy of Portland stone, is to be erected outside the Oratory at South Kensington.

M. Leroux, a pupil of M. Bonnat, has gained the Grand Prix in painting, the subject being *Judith Presenting the Head of Holofernes to the Inhabitants of Bethulia*. Owing to the death of one of the students in the Villa Médicis, M. Déckenaud, who gained second place, will also be able to go to Rome.

The Credit assigned to the Minister of Public Works for the reconstruction of the Opéra Comique in Paris amounts to 1,034,114 francs.

The Dedication of the restored west front of Rochester Cathedral took place on Wednesday. The work has been carried out by Mr. Thompson, of Peterborough, under the direction of Mr. J. L. Pearson, R.A.

Mr. Delissa Joseph is the architect of West India House, Leadenhall Street, which was formally opened last Monday by Alderman and Sheriff Sir Joseph Dimsdale. It cost about 24,000*l.* The contractors were Messrs. John Allen & Sons.

The Lancashire Asylums Board have adopted the plans sent in by Messrs. Crisp & Oatley for the new asylum at Winwick, which the committee consider afford greater facilities for superintendence and cheap administration than any of the others.

The Annual Excursion of the Northern Architectural Association was held on Saturday at Thirsk, Rievaulx and neighbourhood. Twenty-seven members of the Association met at Thirsk, being from Newcastle, Gateshead, Morpeth, North and South Shields, Sunderland, Durham, Darlington, Middlesbrough and Leeds.

Leckhampton Court, one of the finest old residential estates in Gloucestershire, is in the market. It includes an ancient court-house. In the mansion is a lofty dining-room, which dates back to the reign of Henry VII. The outlying portions of the estate include the celebrated Devil's Chimney.

Mr. Francis T. Palgrave has presented to the National Gallery a small picture representing *The Holy Family*, by Eustache Le Sueur. Mr. A. Fowell Buxton has presented a portrait of an elderly lady by Jan A. van Ravesteijn. Neither of these masters has hitherto been represented in the national collection.

The Architect.

THE WEEK.

MR. WALTER PATER, who has died in Oxford, was one of the very few University teachers who could take an interest in art. It afforded him subjects which were adapted to his elaborated style. He was a fervent admirer of Renaissance work, and therefore of Greek sculpture. His essays on "The Myth of Demeter," "Dionysus," "The Beginnings of Greek Sculpture," "The Marbles of Ægina," "The School of Giorgione," and "A Prince of Court Painters," indicate his range of thought. He enjoyed abundant leisure as a fellow of Brasenose, and therefore was able to polish his few essays as long as he considered the operation was needful. But his style is supposed to possess so many charms that it has withdrawn attention from his merits as a thinker. Mr. PATER was born in London in 1839, and received his early education mainly in Canterbury.

ON Saturday Repton Church and Priory were visited by a party of members of the Archæological Section of the Birmingham and Midland Institute. The church is dedicated to St. WYSTAN, who was murdered in 849 and was buried in the monastery then existing at Repton, which had attained to such fame in those days, it had come to be regarded as the Westminster Abbey of Mercia, and burial within its precincts was accounted a great honour. Founded about the year 650, the monastery was destroyed by the Danes in 874; the Saxon crypt alone escaping the general devastation, and for about a hundred years there was probably no church at all in Repton, until in 970, when the later Saxon church was built on the site of the old monastery. The whole of the church (with the exception of the chancel) appears to have been restored in the Norman and again in the Early Decorated period, the spire being the latest addition, in the year 1340. There are consequently embraced within its walls all the various styles of architecture from Saxon to Perpendicular. In 1792 the old carvings were swept away and other "restoration" effected, and in 1854 two round Saxon arches at the east end of the nave were replaced with the present Pointed arches, for the sake of uniformity. The "horse-box" pews were removed and the ancient floor restored in 1885, at a cost of over 3,000*l.* The Saxon crypt, discovered by a gravedigger falling into it through the bottom of a grave he was digging, is almost unique. The Priory was built in 1172 by MATILDA, daughter of ROBERT, Earl of GLOUCESTER, son of HENRY I. In 1538 it shared the fate of most of the smaller monasteries, and was dissolved. The buildings and lands were assigned to one THOMAS THACKER, whose son, being alarmed with the news that Queen MARY had set up the abbeys again, pulled down three sides of the Priory in the year 1548. The remaining side is now the residence of one of the masters of Repton School.

THE works committee of the London School Board have completed their report for the year ending in last March. The cost of sites for school buildings was 99,500*l.*, the surveyors' fees and other charges being 1,175*l.* The value of all the sites purchased, or agreed to be purchased, previous to March 25, 1893, was 2,803,633*l.*, and the costs were 397,749*l.* The total cost, therefore, of the sites purchased up to March, 1894, was 2,900,906*l.*, while the charges amounted to 406,790*l.* The cost was equivalent to 6*l.* 17*s.* per child. Up to Lady Day, 1893, 383 permanent schools had been erected and used; and during the past year fourteen additional schools and twenty-five enlargements were opened. The fourteen new schools, including sites and furniture, cost 377,278*l.*; they afford accommodation for 13,669 children, and the average cost per head had thus been 27*l.* 12*s.* The amount expended on the enlargements, which provided additional accommodation for 8,246 children, was 153,907*l.* The average cost per head of the school buildings and of the furniture, the accounts for which were completed prior to Lady Day, 1894, is as follows:—School buildings (ex-

clusive of sites), 11*l.* 14*s.* 7*d.*; furniture (such portion as was chargeable to capital account), 10*s.* 6*d.* In addition to the accommodation provided during the year tenders have been accepted for more places. Since December, 1892, a thorough inspection of the drains of the schools has been proceeding, and up to March last 355 schools had been inspected. The Board appointed a sanitary surveyor for the purpose of superintending the drainage works. The system of carrying out repairs to buildings by workmen employed by the Board is being continued in nine of the eighteen districts, and the repairs to furniture are now being done by the Board's own men. Nearly one hundred workmen are thus employed by the Board, without the intervention of contractors, at the rate of wages mutually agreed upon by the Central Association of Master Builders of London and the London Building Trade Federation.

A COMPLETE collection of the ancient inscriptions from Asia Minor is about to be published by the Imperial Austrian Academy of Science. The first volume is to contain those of the province of Lycia. More than 13,000 inscriptions have been collected, and of these 1,400 are from Lycia, containing 133 in the oldest Lycian language, which no one can as yet translate. In this first volume the researches and labours of learned Englishmen in past days down to the excellent work of Professor RAMSAY will receive special and honourable mention. But, unfortunately, Professor OTTO BENNDORF, of the Vienna University, who first suggested the above work and is now superintending its publication, has not been able to find the original copies of Lycian inscriptions which were made by the late Rev. E. T. DANIELL in 1840 when travelling with Admiral SPRATT's expedition in Asia Minor. Only a small number of the Lycian inscriptions, which Mr. DANIELL copied with such great care and accuracy, were published. It is, therefore, of the greatest importance in the interests of palæography to find out whether the manuscript copies of the Rev. E. T. DANIELL are still in existence, and what has become of the excellent and accurate copies he made more than fifty years ago. Can any of our readers afford a clue to them? Mr. DANIELL died of fever in Adalia, Asia Minor. His work is so excellent and his copies so accurate that Professor OTTO BENNDORF is most anxious, before publishing the first volume, to obtain if possible a sight of his original manuscripts, especially as he copied more than those few which were published by Admiral SPRATT, and because some of the original inscriptions of which Mr. DANIELL made copies have not been found again, and may easily have been destroyed since then. Any information will be gladly received by Mr. HECHLER, the chaplain to the British Embassy in Vienna.

THE interest which is now taken in England in examples of old Domestic architecture appears to have excited a corresponding desire in Germany to cultivate the national style. By the Union of German Architects and Engineers it is therefore proposed to undertake an immense work on the houses of the peasantry and farmers. From the inquiries which have been made, it appears there will be little difficulty found in acquiring the information which will be requisite to explain the history of the most ancient examples. Brunswick is expected to be one of the most fertile regions for the purpose. In fact, there is so much available that to exhaust the subject it will be necessary to invoke the aid of the Government in the form of subsidies.

A PRIZE amounting to 50*l.* was founded by the late M. BAILLY, architect, president of the Société des Artistes Français. It is to be awarded annually by the Académie des Beaux-Arts, and the intention of the founder was that it should become a recognition of the completion of some important work of architecture. On Saturday last M. LEOPOLD HARDY obtained it on account of the church of Notre Dame, at Lourdes. The Grand Prix de Rome for sculpture has been also awarded by the Academy. The prizeman is M. CONSTANT ROUX, a pupil of MM. CAVELIER and BARRIAS. The subject was *Achilles putting on his Armour after the Death of Patroclus*.

WORKSHOP RECONSTRUCTION AND CITIZENSHIP.*

IN a prefatory note Mr. ASHBEE offers an excuse for the almost fragmentary form of his book by saying the parts have been written "as they have been called for, at different times during the last six years, and they have served in most cases to illustrate some workshop endeavour or some educational principle." As one idea inspires all the pages, the majority of readers would probably not realise that fragments were put before them if the author had not informed them. Whatever it may be called, the book is one which can afford more enjoyment than is commonly derived when technical education is the subject. That Mr. ASHBEE has literary skill is unquestionable, and he has mastered his subject not by considering it at a distance, but at close quarters, and with intellect that was made more acute by affection and enthusiasm.

Let no contractor or manufacturer, however, imagine he will find in the pages any suggestions which will enable him to turn out work more expeditiously and cheaply. That would be a mistake like the agriculturist's who invested in Mr. RUSKIN's "Construction of Sheepfolds" with an eye to business. Mr. ASHBEE is not disposed to aid in making the existing system of production more profitable to anybody, for his aim is to supersede it. If he takes up Tools and the Man as a subject, it is because he believes that if used in the way he suggests the man can be exalted and made more happy by the tools. At one time much was supposed to be gained by the belief in "laborare est orare." The modern gospel, at least among the zealous men who are spending their strength in trying to humanise the East End, would go even further, for holding the belief that Beauty is Truth, and Truth is divine, they would try to make heaven on earth by an organisation in which art would be paramount and the humblest drudgery would become refined, so long as it was a means towards that end. Mr. ASHBEE expresses his own and his friends' aspirations when he says:—

To cultivate the sense of Beauty does pay in the long run; it is worth our while as a nation to do it. Beauty, I repeat, is meant for the enjoyment of man, but its understanding comes before its enjoyment. To understand, we must reconstruct the workshop and remodel the citizen concurrently, and, in spite of the unwholesome precepts of St. Paul and their natural outcome in seventeenth-century puritanism, eighteenth-century torpor and nineteenth-century godliness and commerce, I venture to think Christ knew what He was about when He presided at the marriage of Cana and turned the water into wine.

It will be said of course that an attempt to advance civilisation by art workmanship, craftsmanship, or whatever name we apply to such art as is not admitted by the Royal Academy, is as vain as Mrs. PARTINGTON's attempt to mop up the ocean. But a great many efforts that have been beneficial appeared at first no less absurd. The Mrs. PARTINGTONS of the history of progress form a band that is not to be despised. It may not be possible to transform Mile End and Whitechapel before the century comes to an end, but if the lives of a small fraction of the inhabitants can be made happier by a social experiment which inflicts no loss on the rest of the community, surely it is worth encouragement. Mr. ASHBEE and his fellow toilers may be considered quixotic, but so long as they assume the risks of any derangement to the machinery of the windmills of commerce, they are not very dangerous. Who knows whether by their tilting weak spots in the gearing may not be discovered which otherwise would escape notice?

His experience in teaching is not without effect on the style of Mr. ASHBEE's book. He must by this time have discovered that abstractions are rarely so impressive as the concrete reality, and therefore he adopts the most concrete of all forms, which is the dramatic. He has his characters, and he takes his share in the dialogue. Mr. ARCHIBALD PUSHTON, M.P., of the great house of SKY SIGN & Co.; JOHN PENNYWORTH, the designer in the "H" department of that house; THOMAS TRUDGE, who is one of its producers; TIMOTHY THUMBS, the head-master of the Grinders Street Board School; the Rev. SIMON FLUX, who is willing to employ art or anything else which will give him influence on his congregation, and the Rev. PETTIFER JUGGE, who

believes politics are more serviceable than æsthetics for a parson's purpose, come far nearer to living beings than nine-tenths of the characters which we have met with in novels which have the East End for a territory. In these holiday times we recommend our readers to prefer Mr. ASHBEE's book to any of those social fictions. They will find it will serve the great end of all literature in making them forget trouble for a brief time; but it must also be said they will have to think about what is said long afterwards. Economists even, who have to believe in the existing system of organisation—for it is supposed in a way to be their creation—will at least admit that Mr. ASHBEE has revealed varieties of life which are worth some consideration. There is one class of men who especially should make it a duty to become acquainted with the suggestions in the book. They are the county councillors, committees of polytechnics or trade schools and all authorities who dispense money for what is called technical education. There is no doubt that the subject is causing extravagance that is not creditable to the business habits of the country. Mr. ASHBEE has been enabled to train youths and drill them into competent workmen at an expense which will appear incredible in many a county council committee-room. He is, therefore, warranted in supposing that what has been done in the Mile End Road is attainable elsewhere. One of his suggestions is as old as education itself, for he gives the master precedence over system:—

For my part, I think that the first thing we have to do is to accept the principle of mastership. The mastership not of a department, but of an individual. First, we must have our good master, and we must pay him well. Then we might have him controlled, or guided possibly on occasion, by a committee of experts, men who understand the study of decorative art in the more general sense, each in their own line, architects or designers or painters; with these experts we should put some business men, who have a practical knowledge of the master and of the openings in the industry in question. But it is your master who is the important man; he will give his life to it, the man on whom your schools' future depends, and the most important things about him are his own creative capacity and his relation to his pupils. A man is no good as a master for having passed standards only, that is a paper qualification; he is no good as a master for having technical power only, that is a metallic or a wooden qualification, or at least one limited to the stuff which he works; but the greatness of a good master is that he himself produces, and that he works in men as much as in metals, wood and paper—he must have something magnetic about him. Hence the pupils must have their say in the choice of the master. It is the pupil who is the master's best judge. Therefore the students at our polytechnics should, as far as possible, elect their own master. It is this which was done in the Middle Ages at the universities, where the boy scholars came to hear a good teacher; it is this which gives vitality to the outside ateliers of modern Paris, and the same end should be attained, though it can only be done by slow degrees, at our polytechnics. How to make for it? I answer by telling the students, pupils, workmen, be as independent as possible; by inviting representations from the unions and trade bodies and clubs of the district in which your polytechnic is to be.

The relation of the architect cannot be ignored in any project of workshop or world reconstruction. Mr. ASHBEE introduces, with some variations, the remarkable address on the subject which he read before the Architectural Association two years ago. He proposes the realisation of a suggestion of Sir CHARLES BARRY, that the architect should become the building contractor, and which it is believed would be easy if trades union and co-operative principles were frankly accepted. In enforcing the principle Mr. ASHBEE adopts his favourite plan of putting a living illustration of some kind before us, for he says:—

I know an old gentleman in Mile End—an octogenarian mason with both legs in the grave, for he carves nothing but tombstones—who was trained by Pugin in the Westminster work. He looks back to it as a sort of golden age—it was the time he got real nice work to do—but what has come out of it? There was no effort made to hold the men together, beyond the immediate cash nexus of the contract, and when the great job was done they all drifted apart. Pugin's preaching of Mediævalism and Barry's ideas for the development of contract were all futile and to no purpose for want of an understanding of the social and constructive side of the workshop. The whole tradition was wasted, and my old friend threw his chisel on one side and went into the tombstone line. He now walks about, a small, a very small, master, in a long, a very long, black coat and a very tall top hat, looks like a mute, swears at the indifference of the workmen he employs, but still he does not forget the golden age.

Unless we are mistaken, both PUGIN and his eldest son could confess to a great amount of swearing of terrible oaths committed through the same cause. It was not a golden age for the PUGINS, for the workmen took care to make

* *A Few Chapters on Workshop Reconstruction and Citizenship.* By C. R. Ashbee, M.A., architect, King's College, Cambridge. Published by the Guild and School of Handicraft.

them suffer losses. Mr. ASHBEE would say that only confirms his argument about a neglect of the social-element in the workshop and the necessity of its reconstruction. At any rate, we hope sincerely that he will never have reason to complain of workmen, for ingratitude towards such a teacher and missionary should be unpardonable.

QUOTATIONS ABOUT IRON.*

WE are not, we hope, committing an indiscretion by saying that some of the books which bear the names of architects are in reality advertisements for circulation among prospective clients. If Mr. HARRIS'S "Three Periods" could be considered as one of them it would be entitled to praise on many accounts. In preparing such works, which can only have an indirect sort of success for the author and are rarely read with care, it is wise to produce the utmost effect with the least amount of labour. Now we doubt if in the whole collection of the British Museum an example is to be found in which the right to be considered an author was acquired on such easy terms as in the book we have now before us. At least one-half of the matter consists of extracts from other books. We must give Mr. HARRIS the credit for his courage, in making it apparent to all who take up the volume that his "Three Periods" is a thing of shreds and patches instead of a literary composition, since he prints his spoils from books in smaller type. When fifteen or sixteen pages of the kind follow in succession, the humble rôle which Mr. HARRIS condescends to perform in the production becomes manifest. So numerous are the extracts the printers found it difficult to dispose of them, for Mr. HARRIS has to admit "the apparent abruptness of some of the quotations, they being for the most part introduced with little attempt at constructive arrangement."

It would, perhaps, be better if the method of printing had been reversed, by allowing the extracts which form the parts of the book that have a claim to be considered to appear in the larger type. Mr. HARRIS probably could not persuade the printers to depart from precedent. We are sure he would admit that he does not appear to advantage when he attempts to point the moral of his quotations. In his eagerness to secure attention for the cause he has taken up he becomes rather confused in his utterances, and what may arise from nervousness is likely by unkindly judges to be ascribed to a different cause. He is too full of his subject, or his soul is too perturbed, to treat simple things in a simple way, and instead he tries to be figurative with a contemptuous indifference to what figures involve. A sentence, for example, will begin in this way, "For some 250 years we have been doomed to grope among a chaos of styles;" then the writer's attention is diverted by various circumstances, and, forgetful of chaos, he finishes his sentence by saying "without either the ability or the courage to free ourselves from the clutches of this deadening architectural octopus." Students of natural history will be astonished at the evolutionary power which, in the course of a sentence, can turn styles into an octopus. Mr. HARRIS, we hope, was not ambitious to rival the orator who said, "I smell a rat, I see it floating in the air, but I will nip it in the bud."

The aim of Mr. HARRIS'S book is to convert architects into a belief that there is nothing like iron, except aluminium, as a building material. We may therefore suppose that he is a devotee of science. But hard-headed men of that kind often fail through the weakness of their hearts. We are afraid Mr. HARRIS is a sentimentalist, and subjected to the gentlest of emotions. A book with such a name on the title-page and coming from Holborn naturally suggests the patroness of the excellent Mrs. GAMP and the sensitive spouse of that lady. We learn that he was compelled through affection and remorse periodically to shelter his head in the doghouse, and his howls were then awful. There are tender passages in Mr. HARRIS'S "Three Periods" which suggest affinity with that model of the domestic virtues. Who is it can read the following pathetic words, "A man in the evening of life contemplating the portrait of the wife of his youth, who

died young, seems to afford an apt analogy of the relationship existing between the evolved plan and the petrified elevation" in any place, and especially in a book on metallic architecture, without being overcome? It is true the meaning of the sentence is not clear prosaically, even when we read it backwards; but that increases the effect. As much might be said of a melody by BEETHOVEN. But a man cannot worship lovely woman even with a scientific object in view without suffering in many ways. Mr. HARRIS has modestly refrained from prefacing his book with an autobiography, but there are passages relating to architecture and materials which we imagine are only symbolical of many a bitter pang. Great writers have a knack of turning their woes into "copy," and are relieved by the operation. There are events which are harder to bear than the death of the wife of one's youth, and do we not seem to have an indication of a catastrophe such as can never be forgotten were one to live as long as the patriarchs in the following soliloquy, where Mr. HARRIS ostensibly treats of the appearance of the Renaissance among us? "This alliance with the fascinating foreigner was a dangerous game to play, for the bands of roses were soon metamorphosed into chains of iron, and the generous and too confiding entertainer was soon ousted by the perfidious and insinuating guest." In those words it is evidently memory, with a petrified elevation, which speaks, and the recollection of the chains of iron must inflict keen pain on a man whose mission Destiny has decreed is to persuade the world to believe in the ferruginous virtues.

As we have said, Mr. HARRIS, with all his science, has a heart. He is therefore merciful. May we not suppose that the following passage, beneath a thin disguise of science, is autobiographical, and affords an example to all who have been made to suffer through victims of fickleness?

It is a new system of construction which primarily demands our attention, and having attained that, the artistic development of it will follow naturally, and the "new style" will be realised—a nineteenth or twentieth century, a "Victorian" architecture which may rightly claim to be a lineal descendant of the national style so unfortunately brought to a halt in the sixteenth century, but neither slain nor even maimed by the vigorous attacks of the Renaissance—a victim of fickleness, 'tis true, but nothing worse; and since the Italian charmer can do nothing more for us, let us return to our first love, satisfied that she, returning to purity and simplicity, will be content to cast aside the foreign garb in which she has so long been forced to masquerade, and will deck herself with new materials, so long as they demand of her no sacrifice of truth. Holding high principles, she will agree to nothing which will compromise them; but she will adapt herself to all the various requirements of modern life, and supply the architectural needs of all sorts and conditions of men, having a working dress for the warehouse, a devotional one for the church, and a robe of state for the palace, but, above all, a domestic one for the home.

A less kindly nature would believe that a victim of fickleness would never become stable in virtue, but who can gauge the degree of reform which may arise from the possession of a devotional frock as well as a robe of state and a workaday gown? We do not profess to be competent to judge of affairs so delicate, but when Mr. HARRIS asks, "Which of the two ideas is most in accord with the best part of our nature—one lovingly clinging to the past till time had effaced all its memories, the other treating it with contempt as a despised thing, to be forgotten and buried without remorse or a single kindly thought?" we force ourselves to answer with him, "It is not difficult to decide." At the same time we would premise that the clinging is not to take place in winter, for we have no ambition to awake and find ourselves a petrified elevation.

The favoured ladies and gentlemen who will enjoy the privilege of receiving the "Three Periods of English Architecture," with the author's compliments, will of course be able to appreciate all that is veiled by professional phraseology. They may not, however, realise that if the author had only set out to prove the advantages of metal which entitle it to become "the most prominent building material of the future," he would not be satisfied with printing quotations and interpolated remarks. Mr. HARRIS must know that since architecture began neither a new construction nor a new style was created by the writing or compiling of a book. PAXTON, who was practised in that sort of work, did not initiate his project for the Exhibition of 1851 by its aid. He began with a rough sketch on a sheet of blotting-paper, which occupied him

* *Three Periods of English Architecture*. 1. At work. 2. Asleep. 3. Awaking. By Thomas Harris, F.R.I.B.A. London: Batsford.

while he was supposed to be taking notes about the misdeeds of the railway porters arraigned before him. It was by means of drawings that the novel notion became attractive to the commissioners and the public. If the advocates of a new style are sincere, why do they avoid making drawings and models of what they contemplate? OWEN JONES had a belief, like Mr. HARRIS, about the fitness of iron for the construction of other things besides girders. He was not afraid to design a cast-iron shop-front, and although it was rejected at the Royal Academy he was not daunted, and published it in *The Architect*. Later men talk and write on the subject, but they have not the courage to suggest what they recommend. They leave the risks of the experiment to others. It would be easy, we suppose, for Mr. HARRIS to give an indication of some of the wonderful things which he says are practicable, but he carefully avoids that test. As if he and men like him were great benefactors to humanity, he bequeaths his stock of proposals to young architects, men who, if they attempted to take up novelties that did not attract, would be ruined. As he says:—"It is mainly to the younger men who have the world before them that our hopes turn; they are the units of the power which must work the change. Will they fail us, or with growing interest in, and profound enthusiasm for their profession, will they, availing themselves of the increasing possibilities of their time, so work that the advent of a new century may witness the awaking of architecture from her protracted sleep?" The younger men will be able to interpret that part at least of Mr. HARRIS's book. They will realise that all this munificence means, "Make experiments for us; if they are successful in the eyes of the public we shall honour you by adopting them for our guidance, just as we employ extracts to make up our books; if they fail, you will of course accept all the consequences." Such conduct is not, however, likely to be of much avail in creating a new style.

BRISTOL AND GLOUCESTERSHIRE ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Bristol and Gloucestershire Archæological Society was held last week at Ledbury. Mr. Michael Biddulph, the president, said he proposed to confine his remarks to objects in the immediate neighbourhood, some of which they would see during their excursions; and he would begin with a reference to the oldest monument of antiquity he knew in that district, and that was the magnificent old camp at the Herefordshire Beacon. The entrenchment could be seen for many miles distant, and he thought it must be one of the most ancient monuments in that island. The date he presumed was unknown and was quite lost in antiquity. He supposed it might be called prehistoric. There was no doubt it was constructed by the early tribes who inhabited that part of the country long before the arrival of the Romans. He would give a great deal to know who were the people who constructed that camp and the different scenes witnessed there. One could not fail to be struck by seeing the immense size of the entrenchments; they went for a long way round the hill and in fact they enclosed a very large space; but when they bore in mind that the camp formed a refuge and resting-place for a whole tribe, and not only that, but there were the cattle, and perhaps the cattle of their neighbours which they had stolen, they might understand that they required a considerable space to make a stronghold. There were a number of other camps in the neighbourhood, one Wall Hills Camp, which no doubt was very much the same age. As for Roman remains in that neighbourhood they had not very many. There were some at Hereford and at the other side of the county, but he did not know that they had ever found any Roman remains in the immediate neighbourhood of Ledbury, though he might be mistaken. He referred to the mention of the town in Domesday Book, and said that in 1304 Ledbury returned two members to Parliament, though it did not appear to have returned members after that time. He supposed then, compared with the rest of the county, it was a town of considerable importance. They knew there were cloth manufacturers in the place, and generally there was a thriving and well-to-do population. He spoke of Ledbury at the time of the Civil War, and the battle which took place there in 1645 between the forces of the Governor of Gloucester and Prince Rupert. He regretted that there were no traditions of the battle among the people of the locality, and generally there was an absence of traditions in England, whereas in Scotland, Ireland and Wales the people had many traditions of their forefathers. He

believed there was hardly a working man about there who had heard of the battle of Waterloo.

Alderman Fox proposed a vote of thanks to Mr. Biddulph for his address, and endorsed what he had said of how little the peasantry knew of events in the past that had happened in their own neighbourhood.

Mr. Tuckett would like to hear something about the interesting room of the town hall in which they were assembled.

The President said if he were to enter into the date of that room he would be sure to find someone to contradict him. Some persons attributed the date to the reign of Elizabeth, and others to a period afterwards. He would like to hear someone's view as to the probable date.

Mr. G. H. Piper said there was a town hall there in the time of King Stephen, but he believed the present building was erected in the time of Charles II. No doubt some of the timbers of the old building were used in the present one.

The Rev. W. Bazeley asked if they could not induce the Board schools to teach archæology, which was better than a great deal of rubbish the children learned. Might not the outcome of that meeting be to restore some of the traditions which their President told them were rapidly fading away? When they heard with horror that the people of Ledbury had not heard of the battle of Waterloo, they should take up the subject and plead for it. They ought to do what they could to keep up the old traditions of their people, as upon them, to a great extent, depended the sort of good feeling and English love of everything that was good and true.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

ON Monday the fifty-first annual meeting of the British Archæological Association began in Manchester. The members were received in the Town Hall by the Mayor, who expressed a hope that they would be able to derive much interest and information from their visit.

The treasurer of the Association, Mr. Allan Wyon, in returning thanks, said that in looking over some documents recently he found that the Manchester Grammar School was founded by Hugh Oldham, Bishop of Exeter, in 1519, now 375 years ago, and he said that in founding that college he did it "out of the good mind he bore to the county of Lancashire, perceiving that the children thereof have a pregnant wit, but are for the most part brought up rudely and idly." That was the description which was given by a Lancashire man, so he supposed there was no offence in repeating it on the present occasion. In 1724 he found Dr. Stukeley speaking of Manchester as "the largest, most rich and populous and busy village in England." It appeared, therefore, from their own descriptions in the past that Manchester had been famous for having a most "pregnant wit" and being very busy. Dr. Stukeley, however, differed from Bishop Oldham, who said that the people had been idly brought up. Certainly there was no trace of idleness now, when they looked round this magnificent city. Village which it was in 1724, it had now 500,000 inhabitants, and its goods were called by the name of the city, and were a recognised commodity in every market of the world. Manchester itself gave a name to a port to which ships of the largest tonnage could come from any of the shores of the globe, and in face of these things they must acknowledge that the enterprise and energy of the people gave a refutation to the statement of Bishop Oldham that the people were at all idle. But the "pregnant wit" which the bishop recognised was still manifested in their midst, as was evident when they looked round upon the few things they had been able to see during the short time they had been in the city. They were struck with the magnificent waterworks. Manchester, he believed, had already a supply of 25,000,000 gallons daily; and when they looked at the larger waterworks already constructed from Thirlmere they saw, indeed, that the people of Manchester were not an idle people, but a people of remarkable enterprise. That must strike even the meanest capacity. Then, as they had walked about and seen the noble buildings—the Assize Courts and that magnificent Town Hall in which they were assembled—he felt that they were with a people who certainly had given refutation to the charge that was brought against them by their own townsman 375 years ago, that they were in any way idle. Then there was that magnificent pile of buildings which he had had the privilege of going over that morning—he meant Owens College, founded in 1846 as a fountain of intellectual knowledge for the welfare of the people. The Association had come to Manchester for the purpose of studying archæology in the city and the neighbouring parts of the country. The study of archæology claimed to have the effect of helping on that refinement of thought and mind which prevented people from being styled rude, as Bishop Oldham spoke of them. The local Lancashire and Cheshire Antiquarian Society, with its 320 members, was an efficient society, and to their cordial co-

operation on the present occasion the Association were very much indebted.

In the afternoon the members visited Manchester Cathedral, which was described by the Rev. E. F. Letts, who afterwards conducted the party to Chetham's Hospital.

At the conversazione in the evening Mr. J. P. Earwaker gave an account of the acquisition of the manorial rights of Manchester by the Corporation from Sir Oswald Mosley, and of the various charters and ancient documents relating to the manor of Manchester which are in the possession of the Corporation. He said the last instalments of the purchase-money of the manorial rights would be paid in the present year, when the Corporation would become the absolute lords of the manor of Manchester. The Court Leet Records which came into the possession of the Corporation began in 1552, and they had recently been printed. They contained a large amount of interesting and curious information relating to the early history of Manchester. The old constables' accounts also were now available to the historical student in printed form. The first volume of the Records dated from 1552 down to 1586, extending over the reign of Queen Mary and a large part of the reign of Queen Elizabeth. Most of the early documents relating to the manor of Manchester were written in Latin or Norman French. These had been translated, and furnished a large amount of information of interest to the historical and archaeological student. There were indeed few Corporations of much older standing than that of Manchester which possessed so fine a collection of historical municipal documents.

SHROPSHIRE HOUSES.

IN the address which Mr. Stanley Leighton, M.P., delivered as president of one of the sections at the meeting of the Archaeological Institute, he said:—The history of a county, of a borough, of a parish, is in miniature the history of the nation. No one can thoroughly understand the course of national events who is not conversant with the local and personal currents which give volume to the stream. In England the county and the parish have retained through centuries their identity and their homogeneity. So if any one has mastered the history of a locality he has the key to the history of his country. An acquaintance with "Eyton's Antiquities of Shropshire" cannot be acquired without at the same time realising the great reconstruction which the Normans introduced into England. "Baxter's Autobiography" and "Gough's History" represent, in the most graphic form, the local and personal forces which led to the rebellion, the commonwealth, the restoration and the revolution. A faithful study of what remains to us of the past helps us to appreciate the continuity of change, both in the outward appearance of the country and the personality of its inhabitants. Six centuries ago there were twelve stately religious houses in Shropshire, a hospital of the knights templars and a certain number of friaries. They are all gone. There were at the same time over forty castles in Shropshire. They are all gone as residences of importance. I can only recall three or four which have a vestige of roof left upon their walls. Stokesay is a beautiful but dismantled shell. Shrewsbury Castle, of which Leland says "it hath been a strange thing, but is now much in ruin," suffered still further disfigurement in the beginning of this century at the hands of Laura, Countess of Bath, and Telford, the famous road engineer. Wattlesborough is used as a farm-house, and its square Norman tower is covered with a modern roof. Apley is used as a stable, and little but the foundation is left. Ruins and dismantled houses each have their own story to tell, which will generally repay the trouble of discovery. Stokesay points to the rise of commerce, one of the powerful factors in England's greatness. Its builder was Laurence, a clothier, of Ludlow, who adopted the name of his town, and erected this charming castellated mansion in 1290. "It was not," says Eyton, "till the reign of Edward I. that mercantile wealth could thus readily be exchanged for territorial importance." After passing by heirship to the Vernons, Stokesay again fell into mercantile hands, and was purchased in the reign of Elizabeth or James I. by the aldermanic family of Craven, by whom it was sold again for money made in business to the family of its present owners. I have pointed out how entirely the castles have disappeared as residences. It is difficult to put one's hand on an inhabited house of the fourteenth century, and not easy to find one of the fifteenth and the sixteenth centuries. The most ancient residence in Shropshire, still used, I believe to be the Prior's House at Wenlock, and it is certainly one of the most interesting. Since the dissolution it has passed through many hands, and it is now, happily, in the possession of one who well knows how to preserve its character. I will mention a few other old houses. Plash, near Cardington, can show some remains of Tudor Gothic, intermixed with Elizabethan work, and it has not been much touched during the last two centuries and a half, until it was lately carefully

restored. Condover is the best example of the later Elizabethan style in the county. The Whitehall, however, in Shrewsbury, is perhaps, as a whole, more characteristic, because its surroundings, its gatehouse, its dovecot, its walled gardens and its stables are still pretty much as they were. There is a good example of an early seventeenth-century dovecot and barn at Hodnet. Whitton Court, near Ludlow, Lydston in Claverley, Madeley Court, Lutwyche, Belswardyne, Shipston, Upton Cressett and Plowden are among the sixteenth and seventeenth-century houses which are still maintained as residences. But generally we must seek for old specimens of Domestic architecture in farmhouses, and in many of those cases the old character is well preserved. Black and white timbered houses are to be found all over Shropshire, especially in the towns, and above all other towns in Shrewsbury. Pitchford ranks as the best specimen of a country house in this style as a whole, but the frontage of Park Hall, near Oswestry, will bear comparison with many façades of this class in England. The Marsh or March, in the parish of Westbury, is a small black and white house, and has been excellently restored quite recently, and the same may be said of the Black Birches. Molverley Church, Halston Chapel and Park Hall Chapel are examples of the use of this style in ecclesiastical buildings. The stately but ruinous shell of Moreton Corbet is a fine Jacobean design of the first-rate order. The house was burnt down before it was inhabited, and has never been rebuilt. I draw near to my conclusion, and return to the point from whence I began, that acquaintance in the local evidences of history makes us admit that there are fewer old things of man's contrivance in the world than some people think. Go into any house, and how little can you lay your hands upon that has been in that house for a hundred years? You may see in any well-appointed house books and furniture, and swords and armour, and lace and jewellery, and silver and pewter, linen and tapestry and pictures, but how little, even though it be old, has been in the house for long—how little has been seen by those who lived three centuries ago? There were few books, few pictures, few ornaments in a country house even in the seventeenth century. The old inventories testify to the simplicity, not to say ruggedness, of the lives of our ancestors. So when people bring treasures of art, and especially when they bring portraits to an old house, they should not be ashamed of labelling them, in order that old things which have been purchased may not be mistaken for old things which were brought into the house when they were new and have grown old in the same place. A house may be built in a year—a home cannot be made in a year or in a generation. When people build new houses, by way of making what they call a good job of it, instead of carefully repairing the old ones they destroy a homeliness which they themselves will never see again. More harm has been done by too lavish reconstruction than by neglect. Shropshire has largely benefited in every generation from new-comers, and every generation of men has added to its pleasant residences, and none more than the present.

I think that here the ancient and the modern fairly combine together and every day grow into closer harmony. Certainly people are not so set upon pulling down in order that they may rebuild now as they were in the last century. There is greater reverence for the past and a better reading of its story. In this county something yet remains here and there which is not new, and a genuine sentiment pervades those habitations which have witnessed the exits and the entrances of many a generation. I hope it will never fade away.

TESSERÆ.

The Doric Order.

IT is difficult, if not impossible, to ascertain where and in what manner the Doric order originated. The story of Vitruvius, even supposing it rational, does not coincide with the Greek style of Doric at all, but if with anything with the Roman examples of it, which at the best are mean and inelegant deteriorations of the simple and beautiful original. This author says that "Dorus, the son of Hellenus and of the nymph Orseis, king of Achaia and of all the Peloponnesus, having formerly built a temple to Juno in the ancient city of Argos, this temple was found by chance to be in that manner which we call Doric." In another place he deduces the arrangements of this same order from those of a primitive log-hut in the first place, through all the refinements of carpentry, leaving nothing to chance, but settling with the utmost precision what in the latter suggested the various parts of the former. Chance in one case and experience in another, however, are not enough for this author; but he also tells us that the Doric column was modelled by the Grecian colonists in Asia Minor on the proportions of the male human figure, and was made six diameters in height, because a man was found to be six times the length of his foot, and that eventual improvements occasioned the column to be made one

diameter more, or seven instead of six. "Thus the Doric column was adapted to edifices, having the proportions, strength and beauty of the body of a man." The earliest examples of this order, however, are those which least agree with the primitive forms and proportions of Vitruvius; the columns at Corinth hardly exceed four diameters in height, while in later examples they gradually extend till, in the Temple of Minerva on the promontory of Sunium, the columns are nearly six diameters, being one of the tallest specimens of pure Greek origin ever executed. If the trunks of trees used in the structure of tents suggested the first idea of columns, and of the Doric in particular, as many contend, how is it that the earliest specimens discovered are the most massive? For the merest saplings would have formed the wooden proto-columns, and necessarily, when imitated in stone, they would not have been made more bulky than the less tenacious nature of the material required, much less would the slender wooden architrave have been magnified into the ponderous entablature of the primitive permanent architectural structures of all nations.

Oblique Pressure and Classic Architecture.

Greek architecture having in itself few elements of change or corruption, survived in tolerable purity for a longer period than any other known system, and even in its latest works (few of which, however, were durable enough to remain to us) it escaped one fault that seems to have had a great share in breaking up all other styles (the Egyptian, Roman, Hindoo, Arabian and Gothic, for instance), viz. the use, as ornaments, of miniature models of the principal features—the puerility that led in Egypt to making a capital like a little house or temple; at Rome and Baalbec, to enclosing a niche with small columns and a pediment; in Gothic England, to applying buttresses and pinnacles without number; in India, to a similar crowd of modelled colonnades, verandahs and domes; and in Moslem lands, to shelves and cupboards like cloisters, and to that multiplication of little sham vaultings that have obtained the name of the stalactite ceiling; the object of all being to get false magnitude by diminishing the scale, an artifice that never succeeds except on paper, on which these things often look vast and sublime, but never in reality. The Greek system escaped all this, but one constructive change, the introduction of oblique pressure, destroyed it. The Romans succeeded in imitating no order but the Corinthian, and this only when they adhered strictly (at least externally) to Greek construction as well as decoration, as in the Pantheon portico, the temples of Nismes and Baalbec. The columns and entablatures stuck on the face of an arcade, as in the Colosseum, are a constructive lie, but not, as some suppose, a huge ornament. The lie consists in their appearing a mere ornament, while they are really indispensable to stability, for these columns are really the buttresses or props of the internal vaulted ceiling, and they would have to stand out obliquely and form apparent props were it not for their entablature, which often itself a piece of disguised arch construction, in order to throw all its weight on the columns, serves the purpose of the Gothic pinnacle to steady the column below against the side thrust, by combining its vertical pressure with the oblique thrust to produce a resultant more nearly vertical, and capable of being confined within the foot of a vertically placed column. But the column is false, because it appears made to sustain the vertical pressure alone. Being a prop it should have appeared one; but this was never attempted till the thirteenth century. Till then propping, though a sound principle in building, was considered an improper one to appear in architecture, and this one disguise kept the art for fifteen centuries in a continually deepening degradation. The arch was introduced by the Etruscans or Romans; but its necessary attendant, the prop, was struggled against for fifteen centuries before architects would admit it without a mask.

Vitruvius.

Vitruvius, being ignorant of any other than his native architecture, which was Roman, and generally derived from the Greek, concocted or adopted a silly fable about the origin of building, and pretends to trace from it the invention of what are called "the orders" by the Greeks, giving, however, to each a separate fable of its own. He professes to give the proportions, arrangements and disposition of the architectural works of the latter people and the rules by which they were composed. He describes with considerable minuteness various species of temples and other edifices of both the Greeks and Romans, and endeavours to give reasons for almost everything connected with them. His account of the advance of man from a state of savage wildness to civilisation, the discovery and acquisition of fire and progress in the art of building made by the early fathers of the human race is only surpassed in absurdity by his stories of the invention and proportioning of the various columnar ordinances of which the ancients made use; if we except perhaps the fact that this crude system has been received and propagated throughout the civilised world ever since the resuscitation of the work four centuries ago. How

could a man who evidently knew nothing of the early history of the world, of the Celtic monuments or of the history and architecture of Egypt and the East be supposed capable of describing the inventions and advances in knowledge of the human race? Nor is this all. How can Vitruvius be received as an authority when it is found that he does not correctly describe any existing edifice in either Greece or Italy, and that no example of ancient architecture, either Greek or Roman, is in perfect accordance with his laws?

Roman Mausolea.

As works of architecture the sepulchral monuments of the Romans were of more importance than their domestic structures. There is more architectural display in the "Street of the Tombs" at Pompeii than in any street of the city itself, and the mausoleum of Hadrian on the right bank of the Tiber at Rome was a much more important object in its perfect state than his villa near Tivoli could ever have been. It was perhaps the most splendid structure of the kind ever executed, excelling the Memphian pyramids as much in architectural pretence as they surpass it in magnitude. There was, too, a degree of harmony and simplicity in its composition, which can only be accounted for by supposing that the imperial builder, who was himself an adept in architecture, had acquired better taste than the architects of Rome generally possessed, by the contemplation of the monuments of Greece and Egypt. It consisted of a deep quadrangular basement, each of whose sides was about 250 feet in length. This was surmounted by a lofty circular mass, on which was a graduated stylobate, supporting a noble peristyle of Corinthian columns with their entablature, forming, with its circular cone, a species of peristylar temple, something like that below the cupola of St. Paul's Cathedral in London. Above this there was most probably a species of dome, whose acroterium is said to have been a metal pine-cone, which was the receptacle of the ashes of the emperor. The mausoleum of Augustus was inferior in size, in splendour and in good taste, we may believe, from the descriptions which exist of it when in a more perfect state than it is at present, to that of Adrian, but it was nevertheless a magnificent monument. Its form was conical; it diminished in storeys and terraces, probably columned round, and terminated at the apex in a bronze figure of its founder. The sepulchral monuments of Cecilia Metella, of the Plautian family and others, are evidences of the same fact. The sarcophagus from the first-mentioned of these is simple and elegant in the extreme, and indeed it exhibits a greater degree of good taste than almost anything of the same kind that remains to us of the ancients.

The Second Cathedral at Salisbury.

Winchester was the original see among the West Saxons; this was divided and subdivided, and Wiltshire is believed to have been included in the diocese of Sherbourne for some two centuries, when, in pursuance of Alfred's intentions for restoring order in ecclesiastical affairs, a synod was held under Edward the Elder, and the two bishoprics of Dorchester, in Oxfordshire, and Sherbourne were divided into five. One of these was for Wiltshire; the seat of the bishop was unsettled, and is said to have been alternately at Wilton, Sunning and Ramsbury, near Marlborough. Herman de Lotharingia would have removed the episcopal seat from Wilton to Malmesbury. Edward the Confessor consented, but the monks of Malmesbury were not disposed to be under any episcopal governance. Herman retired to St. Omers, assumed a monk's habit, and when he returned to England he was instrumental in two great changes, viz. the union of his diocese with that of Sherbourne, and the removal of the combined sees to Sarum. At Sarum he began a cathedral which was completed by his successor, Osmund, who had accompanied William the Conqueror in his invasion, and held the high office of Chancellor. After Osmund came Bishop Roger, whose fortunes were as tragic as Wolsey's. Among other works of the same kind he rebuilt the church at Sarum, which had been injured by storms and fire, and beautified it so greatly that it yielded to none in England at that time. The third in succession to Roger was Herbert Poore, and in his episcopacy it was determined to remove the cathedral from the hill at Old Sarum to a site in the valley two miles distant. The motives for this removal are specified in the bull whereby it was authorised. It was alleged, the Pope said, "That forasmuch as your church is built within the compass of the fortifications of Sarum, it is subject to so many inconveniences and oppressions that you cannot reside in the same without great corporal peril, for being situated on a lofty place it is, as it were, continually shaken by the collision of the winds, so that whilst you are celebrating the divine offices you cannot hear one another, the place itself is so noisy, and besides, the persons resident there suffer such perpetual oppressions that they are hardly able to keep in repair the roof of the church, which is constantly torn by tempestuous winds; they are also forced to buy water at as great a price as would be sufficient to purchase the common drink of the country, nor is there any access open to the same without the license of the castellan. So that it happens that on Ash Wednesday, when

the Lord's Supper is administered, at the time of synods and celebration of Orders, and on other solemn days, the faithful being willing to visit the said church, entrance is denied them by the keepers of the castle saying that thereby the fortress is in danger. Besides, you have not there houses sufficient for you, whereby you are forced to rent several of the laity, and that on account of these and other inconveniences many absent themselves from the service of the said church." These inconveniences having been sufficiently proved, Pope Honorius authorised them to remove the church to a more convenient place, "but saving to every person, as well secular as ecclesiastical, his rights, and the privileges, dignities, and all the liberties of the said church to remain in their state and force." A piece of ground, called Merrifield, having been chosen for the site, the first business was to erect and consecrate a wooden chapel for temporary use, and then to consecrate a cemetery adjoining. The primate, the young King Henry III. and all the other chief persons of the realm were invited to attend when the foundation should be laid, as at an event which was not unfitly deemed to be of national importance. The bishop, after consecrating the ground, laid the first stone in the name of the Pope, the second in that of the Archbishop of Canterbury, the third for himself, the fourth was laid by William Longspee, Earl of Sarum, the fifth by Ela de Vitri, his wife. Then the nobles who were present laid each a stone, and after them the dean, the chanter, the chancellor, the treasurer and the archdeacon and canons of the church of Sarum in their turn, "the people weeping for joy and contributing thereto their alms with a ready mind, according to the ability which God had given them." Several nobles on their return from Wales (where the king was then concluding a treaty with Llewellyn ap Iorwerth) repaired to Sarum to partake in the merit of the work which was going on, and laying each a stone, bound themselves to some special contribution for seven years.

Raphael and Da Vinci.

What would have been the effect on Raphael's mind and style of painting had he remained a longer time under the influence of Leonardo is not an uninteresting question. Nay, we may carry it back to his early training and ask, "What would Raphael have been had he been brought up in the school of L. da Vinci instead of that of Pietro Perugino?" Let us transport ourselves to the great room of the Louvre, where we have specimens of Raphael's early Florentine or Peruginesque manner; of his later Florentine and of his Roman manner; and where we have also two noble specimens of Leonardo's easel pictures. Now if we take the quality of expression—meaning thereby the thought and sentiment conveyed by the human countenance, and, in a less degree, by the attitude—Raphael's pictures stand the comparison with Leonardo's very differently. The earlier ones—the *St. George* and the picture called *La Belle Jardinière* are thrown somewhat in the shade; but there is a chivalrous determination in the attitude of the warrior saint that shows thought and purpose in the artist; and the exquisite purity of the Virgin's expression, the charm of her oval face and the downcast eyes are things *sui generis*—very delightful to the feelings if not suggestive of deep thought. But the great *Holy Family* and the *Saint Michael* are positively killed by Leonardo's proximity. They may have possessed a more spiritual character when Francis I. first received them, but as they are now seen they wax pale as regards the quality of expression before the *Santa Anna* and the portrait of *Mona Lisa*. The comparison of Leonardo's (or his pupil's) *La Vierge aux Rochers* with Raphael's *Ste Marguerite* is equally unfavourable to Raphael's pretensions to the character of a thoughtful painter. It may of course be said that Raphael's fame does not rest on his oil-pictures but on his frescoes and his cartoons for the tapestries. Neither does Leonardo's rest on his easel pictures, but on his cartoon of the *Battle of Anghiari* and his *Last Supper*. Putting these facts together and speculating thereon, it does appear more than probable that Raphael, had he studied under L. da Vinci instead of Pietro Perugino, would have learned to portray qualities of mind which only now and then find in him a ready and congenial exponent. And he would doubtless have acquired a greater insight into the structure of the human frame and more unerring accuracy in drawing the extremities. It will perhaps strike the reader that the comparison of Leonardo's serious pictures with Raphael's later works, in which he did not aim at representing intensity of thought and sentiment is unfair. Doubtless there is more similarity between Raphael's *Sposalizio* and his *Madonna del Granduca* and Leonardo's *Vierge aux Rochers* and *Santa Anna* than between any of Raphael's Louvre pictures and Leonardo's. It may be said further that where there is no identity of aim between two painters there can be no comparison between their works. Granted, but let us compare their respective aims. If we find one painter aiming at the representation of deep thought and sentiment and the other at that of a greater variety of emotion; the one choosing types of countenance and attitudes which harmonise

with a profound, tranquil, meditative spirit, and the other delighting in the various expressions which mark the differences of age and sex, and the easy and delicate play of graceful lines, which diffuses a joyous cheerfulness over the picture, we are surely at liberty to say which we prefer and which aim we think the nobler. Moreover, when the latter painter has changed his aim—when we find that at an earlier period he placed before his mind a different object as attainable by his art, we may surely compare the purpose of his youth with that of his later years; and if the latter appear to us less noble we may express a feeling of regret that he had not the inducement to persevere in his early motives which the example of Leonardo would have given him.

English Domestic Architecture.

In this country, which is still rich in the possession of numerous specimens of buildings, both ecclesiastical and domestic, belonging to the earlier ages of its history, the old English style, in some of its varieties, is that which is specially appropriate to an English country residence. The village church always, often the parsonage, and usually the neighbouring farmhouses and cottages, partake, in their several degrees, of this character, and assist in determining its choice. The natural scenery around presents congenial images in the venerable grove with its patriarchal rookery, and the ancient oaks spreading their broad arms over the lawns and glades of the feudal park. The local annals of the estate, of the site itself, or of the proprietor's family, combine to call for the employment of a style which is connected with so many of the most pleasing recollections of our national history. The irregularity of outline which it admits, and indeed almost requires, allows of any arrangement of the apartments which comfort or fancy may suggest, and accommodates it to all the varied wants of modern life. Moreover, it is equally appropriate to every rank of habitation, from the princely palace down to the snug parsonage or humbler cottage. And its intrinsic beauty and picturesqueness are thus increased and set off by the valuable qualities of harmony with the neighbouring buildings, fitness for all its possible purposes, and historical and local association. In all these points it infinitely excels the Classical styles. The symmetry and regularity of these interfere with the convenient disposition of modern apartments; their porticoes and colonnades shut out the light, unless made so shallow as to destroy the intended effect; nor does their outline harmonise with the general character of the rural scenery of this country, any more than their plan with its climate, or the ideas they recall with its history. The Grecian temple appears as completely out of place in an English landscape as would a cloistered abbey or feudal castle in the prairies of Kentucky or Illinois.

Roman and Pompeian Houses.

If evidence were required to prove the futility of written descriptions of buildings when their general model is unknown, it would be enough to compare the house of a Roman gentleman in Pompeii with the various designs which have been made of the same thing from the descriptions and directions of Vitruvius, before the exhumation of that city. Their authors could only work upon the notion they had of laying out houses; and therefore the plans produced are those of ill-contrived modern residences, so arranged that they may present a uniform and architectural external elevation, which the Roman houses have not; with windows properly lighting every apartment, which are totally wanting in the latter; with staircases to upper storeys that did not exist; with corridors and doors uniformly disposed, which was unheeded in laying out a Roman house. The Vitruvian restorers put columns wherever they could, whereas the Roman architects appear only to have put them where they could not avoid it. In dimensions, too, the former erred no less than in distribution; they thought none too extensive for a Roman domicile; but the apartments in Roman houses, wherever they are, are generally small, and in ordinary cases their whole site is exceedingly restricted. In proportioning the various parts, they adhered to rules the Romans never heeded, and applied the details of the architecture of temples and triumphal arches to domestic edifices, in whose composition the plasterer, painter and mason almost appear to have been the only architects. Far inferior as Pompeii was to Rome in magnitude and splendour, there is no more reason for supposing that houses in the latter were so very differently arranged from those in the former, that the same general description of them should not apply to both, than there would be for a future antiquary to hesitate in applying the plan of a Brighton or Bath house which may be preserved to a London mansion, for we know that in ordinary cases they nearly coincide. It is, too, a recorded fact that wealthy Roman citizens had mansions at Pompeii and Herculaneum, and discoveries made of ordinary houses under the present level of Rome show them to be exactly like the more perfect ones of the Campanian city, except in their state of preservation; so that, *parvis componere magna*, in Pompeii we may see the domestic as well as public architecture of ancient Rome.

NOTES AND COMMENTS.

AN interesting valuation case came before Mr. Justice MATHEW and Mr. Justice KENNEDY on Monday. In Oxford the valuations of the University buildings used to be assessed by a committee, partly composed of heads of houses and resident members of the University. In 1890 an Act was obtained by the Corporation by which they were empowered "to levy, collect and recover, as well as to make and assess, all municipal rates." One of its effects was an increase in the valuation of various University buildings. The Bodleian Library, Divinity School, &c., which were formerly valued at 1,000*l.*, were put down at the rateable value of 1,840*l.*; the Clarendon Press was increased from 1,196*l.* to 2,160*l.*; the University Museum, from 800*l.* to 1,120*l.*; the Clarendon Buildings, from 336*l.* to 360*l.*; the Ashmolean Museum, from 200*l.* to 224*l.*, and so on. The Council in October last made a district rate which was based on the new valuation. The University authorities declined to pay, on the ground that the assessments should have been based on the Poor Law valuation lists as formerly, and therefore the rate was bad. It was held by Mr. Justice MATHEW that the Legislature could not have contemplated the assessment of buildings at different sums in different valuations. The Corporation of Oxford had been made an independent tribunal for the purpose of treating all the rates according to a uniform standard, and therefore the new assessment and rate were valid. Mr. Justice KENNEDY concurred in that opinion. Another anomaly has been therefore removed in Oxford.

It would appear that the external surface of concrete walls will be affected by the character of the timber employed for the temporary framing. In some military works by the United States engineers the plan originally followed was to build all the concrete work with frames of undressed spruce lumber, and then, on removal of the frames, to plaster the exposed face with cement. This coat of plaster could not be made to adhere to the older work, which rapidly absorbed its moisture, weakening the bond between the two, which was destroyed by the first cold weather, when the coating cracked and dropped off, much to the detriment of the appearance of the work. There was, besides, no economy in the use of spruce lumber, which warped out of shape when subjected to the moisture of the concrete, and could seldom be used more than once, and the plastering was very expensive. It was therefore decided to substitute framing made of first quality dressed white pine, grooved on both edges, and united by loose tongues of yellow pine, and to construct the masonry differently. That portion of the concrete next to the frame, 4 inches thick, was laid, and on the frames being removed, a rubbing with a float was sufficient to give a smooth surface to the face. The work was found to resist changes of temperature without scaling or cracking.

THE Coventry City Council have adopted the following resolutions:—"That competitive designs be invited from architects practising in Coventry, and from a limited number of others to be selected by the committee from architects who have expressed their willingness to compete on the terms now proposed." "That a premium of 150*l.* be offered for the best design, and 50*l.* each for the designs placed second and third in order of merit, the adjudication being in the hands of an independent assessor. That the plans and design placed first in order of merit, and in respect of which the premium of 150*l.* is paid, remain the property of the Corporation, and be retained by them, all others being returned, carriage paid, to their respective authors." "That competitors be informed that as the Council is uncertain, when, if ever, complete municipal buildings will be erected, they are unable to agree at present to employ the author of the design placed first to carry it out; but that they do propose, if no insuperable objection exists, to employ him to carry out such portion of it as can at once, or from time to time, be undertaken, on the usual professional terms, such portions to be so arranged as to be part of the entire design, and consistent with its future complete realisation. That they also agree to pay

the author of such design (or his representatives) one and a quarter per cent. on the estimated cost of the unexecuted portion of his design, if within seven years from the choice of the same no instructions are given for the completion of the buildings, having due regard to any portions which may then have been executed by the architect." Mr. CHARLES BARRY has agreed to become assessor, his fee being 100 guineas, and 10 guineas each for any preliminary conferences, with travelling and hotel expenses.

TOURISTS who are eager to behold Malmaison, in which the first NAPOLEON enjoyed a few years of happiness, should lose no time in visiting the retreat. According to Mr. DANVERS POWER, who has just visited the place, the whole estate has been sold, and is now largely cut up into building plots, but the château itself remains, with part of the park and the site of the old gardens. Malmaison presents a deplorable appearance, the floors, roofs, and woodwork being in a state of decay which would render restoration a work of great expense, even if anyone could be found who required a castle surrounded by a building estate. But the rooms, though absolutely dismantled, still bear traces of their old uses, and are easily distinguishable. The library, dining-room, drawing-room, and the Empress's bedroom in which she died may be mentioned. Malmaison is near Rueil, which is within twenty minutes' railway journey from Paris.

THE latest excavations at Jerusalem undertaken by the Palestine Exploration Fund are proceeding with a success that is encouraging. The site lies to the south of the city, outside the walls, close to the English cemetery. Traces of the ancient wall are sought, and there are already indications that this hope will not be disappointed. Mr. BLISS, the representative of the Fund, reports that having sunk a shaft at a point a little south-east of the cemetery and driven a tunnel from it in a north-easterly direction, he came at a distance of 48 feet "upon a finely-worked rock-scarp." This was traced, following its various angles and working both to the right and the left, for about 140 feet, and is thought by Mr. BLISS to mark "the veritable exterior line of fortifications of ancient Jerusalem." Whether this supposition is correct remains to be ascertained. One of the inhabitants in digging the foundations of a house to the north of the city, not far from the church of St. Stephens, has discovered a very beautiful mosaic pavement. Mr. BLISS describes it as "a splendid piece of work, measuring about 21 feet by 13 feet. . . . Within a beautiful border . . . is a vine with branches on which hang clusters of grapes, and among the branches are numerous birds—peacocks, ducks, storks, an eagle, a partridge, a parrot in a cage, &c. It is almost perfectly preserved, and near the eastern end is an Armenian inscription to the effect that the place was in memory of all those Armenians whose names the LORD knows." Underneath is a cavern in which were found bones, lamps and glass vases. Photographs of the mosaic can be seen at the office of the Fund in Hanover Square.

ON the 11th and 12th of the present month the old Roman theatre at Orange will be utilised for representations of the two tragedies "Cedipe" and "Antigone" by members of the Comédie Française. For some time past a restoration has been in progress under the direction of M. FORMIGÉ, the architect, and the seats have been reconstructed up to the first platform. As the profits of the performances will be devoted to the work, it is expected that before long the whole of the building will be restored. The theatre was intended to accommodate about 12,000 spectators, and it is remarkable that in its existing state the acoustic properties are remarkable, and words spoken in the proscenium can be heard in the most remote parts of the ruins. The site selected is at the foot of a hill. The plan is semicircular, the stage and its dependencies forming a sort of rectangular chord. At one time the theatre was adorned in a magnificent style, but the marble columns, statues, reliefs and other decoration can only be imagined by the aid of a few fragments.

LONGHOUSE FARM.

THIS farmhouse, which is for a dairy-farm on the Orchardleigh estate, is now in course of erection. The cheese will be stored in a room over the dairy. The builder is Mr. J. VALLIS, of Frome, and the architect, Mr. B. VAUGHAN JOHNSON, M.A., of Westminster.

WATERHEAD BATHS, OLDHAM.

THE building is situated on the corner of a plot of land abutting on Cedar Street on the front and Mortar Street on the side. The superintendent's house is placed at the angle of the two streets, and having lobby, sitting-room, kitchen and scullery on ground floor, three bedrooms, also cellar. In the centre of the block is ticket-office, well lighted with a large elliptic-headed bay window. This room is well fitted up with drawers and cupboards for storage of towels, &c.

On each side of this room are the male and female entrance corridors, fitted with swing doors, having upper panels glazed with lead lights, and separated from ticket-office by glazed screens, with bay window and registering turnstiles to each, a gate being provided to turnstiles for use of officials, &c.

Behind here there is a cross corridor, which leads on the left to twelve male slipper-baths, and on the right to six female slipper-baths, there being a separate waiting-room for each sex.

The whole of the slipper-baths are porcelain, glazed both inside and outside, having no wood framing round whatever. This system is the most sanitary arrangement, as it allows the attendant to have thorough supervision, so that it would be impossible for the slightest dirt to accumulate without his knowledge. Five of the slipper-baths are used as first-class, having showers and other advantages over the remainder. The supply of hot and cold water to the baths is regulated by means of valves worked by a detachable handle by attendant from the corridor. From the cross corridor the plunge-bath is reached, the dimensions of this room being 74 feet by 46 feet, with a water area of 60 feet by 26 feet, the depth being 6 feet 6 inches at one end and 3 feet 6 inches at the other; the bottom is tiled with black and white tiles formed in panels, the sides being faced with white glazed bricks. A diving platform is provided at the deep end of bath. Round the gangways are ranged forty-two dressing-boxes, there also being the necessary foot-baths, shower, water-closets, urinals, &c. Six Stott-Thorpe pendants with ornamental wrought-iron scrolls are provided. The entrances to this bath are so arranged that it can be used by either sex without interfering with private-bath corridors. At the rear of the premises are the laundry and boiler-house, the former being fitted up with all modern requisites, consisting of patent steam-power washing machine, also rinsing-tank, with wringer having rollers of vulcanised indiarubber, wringing and mangling machine, drying chamber containing six drying horses, four washing troughs, all fed with steam, hot and cold supply, the whole of machinery being worked by steam-power by means of a vertical steam-engine and shafting driven with belting.

A two-flued boiler, 15 feet by 6 feet 6 inches, made by the Oldham Boiler Works Company, supplies steam for the system throughout. The floors to the whole of baths and corridors are of steel joists, and finished with granite-faced concrete, being plentifully supplied with channels and grids to convey away surplus water. The baths and corridors have dados of white glazed bricks with ornamental bands at top. The whole of premises are efficiently heated by steam. The continuous lantern lights both over plunge and private baths are made to open from end to end for ventilation by means of cranked levers, &c., worked by attendant from the floor. The whole of the building work has been carried out by Mr. WILLIAM LÉES, the sub-contractors being:—Excavating and drainage, Mr. JAMES BRIERLEY; brickwork and concreting, Messrs. S. & J. SMETHURST; masonry, Mr. T. BEBBINGTON; steel joists, &c., Mr. EDWARD WOOD, Man-

chester; wrought-ironwork, Mr. J. KERSHAW; slating, Mr. JOSEPH JACKSON; plumbing, glazing and painting, Messrs. HARKER BROS.; plastering, Mr. DAVID ROTHWELL.

The whole of the steam, hydraulic and engineering arrangements throughout have been carried out by Mr. W. F. SPENCER, Crossbank Works, Oldham, the whole having been executed according to the plans and under the supervision of Mr. CHARLES T. TAYLOR, A.R.I.B.A., architect, 10 Clegg Street, Oldham, whose design was placed first in competition by the professional assessor.

ST. PETER'S CHURCH, STAINES.

THE new church of St. Peter's, Staines, was consecrated by the Bishop of Marlborough on Saturday, July 28. It is, we believe, the first church which has ever been erected in this country by a lawyer who has filled the high office of Solicitor-General.

In the light of this fact a few remarks concerning the church will be read with general interest.

The work was placed in the hands of Mr. George H. Fellowes Prynne, F.R.I.B.A., of 6 Queen Anne's Gate, Westminster, early in 1892. After some unforeseen delay the tender of Messrs. Goddard & Sons, of Farnham, for 6,000*l.* was accepted, this sum being exclusive of the tower and spire, which have since been given by Sir Edward Clarke at an additional cost of about 1,400*l.* The screen has also since been given at a cost of nearly 300*l.* The style chosen in design is a free treatment of Perpendicular in red brick and stone.

The nave is of four bays 26 feet wide by 80 feet in length, having a height of 40 feet to the apex of the waggon roof. The chancel is of the same width and height as the nave. Aisles are thrown out on the north and south sides of the nave. There is a narthex at the west end with western entrance. The tower, which is placed at the south-west end of the south aisle, is designed in three stages and capped with a copper-covered spire. In the lower stage on the nave floor level a baptistery is formed.

In the upper stages, which are ornamented externally with panelled work in brick and stone, are arranged the belfry and bell-ringers' floor.

A southern transept with separate entrance forms the nave of a small chapel on the south side of the chancel. On the north side of the chancel are clergy and choir vestries with the organ chamber. The altar is elevated by nine steps from the nave floor level, and ample space and height are left above and behind the altar for a baldachino or reredos. One of the main features of the church is the constructional rood-screen, which is carried right up the chancel arch, the upper portion of which is enriched with tracery. The central figure and rood are designed to be cut out of the solid stonework of the tracery, and the side figures placed on corbels formed in the panels of the tracery. This feature is quite unique, no other example of similar treatment existing. All the sculptured work has been done by Mr. J. Taylerson, of Lavender Hill.

Throughout the work has been well and thoroughly executed by the builders, Mr. W. H. Augur, of Staines, acting as clerk of works. The furniture of the church is of an appropriate and ornate character. Choir stalls have been presented by Sir Edward; and the altar, which is of very elaborate design, and which is to be highly decorated in gold and colours from the architect's design, is a gift of Lady Clarke.

Both the stalls and altar have been carried out from the architect's designs by Messrs. Lonnie & Co., of Camberwell. The iron screen-work and chancel gates and door furniture have been made by Messrs. Singer & Sons, of Frome.

The rich dossal and hangings were supplied by Mr. Alfred Stalman, of Frith Street, Soho. Mr. Puckle, the churchwarden, presented a window in the south aisle, and a pair of old Norwegian candlesticks were given by a legal friend.

Messrs. John Warner & Sons, Limited, supplied the tenor bell in E, weighing 15 cwt.

THE MANCHESTER SOCIETY OF ARCHITECTS.

A VALUABLE addition to the architectural works in the library of this Society has just been placed on the shelves at 36 George Street, namely, thirty-five volumes presented by Mrs. Whitaker, the widow and executrix of the late Mr. William Wilkinson Whitaker, architect, of Cornbrook House, Manchester. The folio volumes include several works by Sir M. Digby Wyatt, "The Ecclesiastical Architecture of Italy" by Henry Gully Knight, "Henry VII. Chapel, Westminster," by Cottingham, and "St. Stephen's Chapel" by Mackenzie, and other valuable works.

Mrs. Whitaker also supplemented her gift by a liberal donation in money for the purchase of other books.

THE TRUE PRINCIPLES OF POINTED OR CHRISTIAN ARCHITECTURE.

By A. WELBY PUGIN.

(Continued from page 60.)

LECTURE II.

WE will now proceed to consider decoration with regard to constructions in wood, which are founded on quite opposite principles to those of stone. With timber you may attain a great height or extend over a great breadth, by means of a single spar reared on its base or supported at the ends. The strength of woodwork is attained by bracing the various pieces together on geometrical principles. This is beautifully exemplified in ancient roofs either of churches or domestic build-

The stupendous roof of Westminster Hall, decidedly the grandest in the world, illustrates this principle fully, and so do all the roofs in the collegiate halls of Oxford and Cambridge, as well as those of the palatial edifices at Eltham, Hampton Court, Croydon, and many others belonging to manorial residences.

Of wooden roofs over churches we have beautiful specimens in various parts of England, but especially in Lincolnshire, Norfolk and Suffolk. The beams of these roofs are beautifully moulded and enriched with carvings (figs. 3, 4).

Ancient Roof with the Framing made Ornamental (Fig. 1).

Modern Roof with the Framing concealed by a Plastered Ceil

Blakeney Church, Norfolk (Fig. 3).

Bury St. Edmunds (Fig. 4).

ings; the construction of these, so far from being concealed, is turned into ornament. The principal tie-beams, rafters, purlins and braces, which in modern edifices are hidden at a vast expense by a flat plaster ceiling, are here rendered very ornamental features, and this essential portion of a building becomes its greatest beauty (figs. 1 and 2).

Nor were these carvings without a mystical and appropriate meaning; they usually represented angels, archangels and various orders of the heavenly hierarchy, hovering over the congregated faithful, while the spaces between the rafters were painted azure and powdered with stars and other celestial emblems, a beautiful figure of the firmament. Some of these

angels held shields charged with the instruments of the Passion, the holy name and other emblems; others labels with devout scriptures. Every portion of these roofs was enriched with painting, and when in their glory must have formed splendid canopies to the temples of the living God; and what is peculiarly useful to illustrate my present purpose, these roofs were of an entirely different construction to coverings of stone. Wooden groining is decidedly bad, because it is employing a material in the place and after the manner of stone, which requires an entirely different mode of construction.

I am aware that ancient examples of wooden groining are to be found in the cloisters of Lincoln Cathedral, Selby

made an entirely different arrangement in their upper parts, suitable to an ornamental wooden roof.

At Bury St. Edmunds is a glorious roof, of which I have given a sketch. At every pair of principals are two angels as large as the human figure, bearing the sacred vessels and ornaments used in the celebration of the holy sacrifice; these angels are vested in chasubles and dalmatics, tunics and copes, of ancient and beautiful form; the candlesticks, thurible, chalice, books, cruets, &c., which they bear are most valuable authorities for the form and design of those used in our ancient churches. The roofs of St. Peter's and All Saints, in that truly catholic city of Norwich, are very fine; and in

ng of an old House at Long Melford.

Ceiling of an old House at Antwerp.

Ceiling, Clopton Chantry, Long Melford.

Church and some others; but in these cases, as well as any others in which it may be found, an inspection of the building will clearly show that they were originally intended to have been groined with stone, and that the springing ribs have been carried up some height in that material, but that owing to a real or supposed weakness in the side walls, which were not considered capable of resisting the lateral pressure of stone vaulting, the expedient of an imitation groining in wood was resorted to as a case of absolute necessity; and I am decidedly of opinion that had not the original intention been to have groined these churches in stone, their builders would have

Lavenham and Long Melford churches, in Suffolk, [are admirable specimens of carved timber roofs.*

But, alas! how many equally fine roofs have been demolished and burnt by the brutal ignorance of parish functionaries!—how many have been daubed over by the remorseless whitewasher!—how many painted in vile imitation of marble, as at Yarmouth (especially if the churchwarden for the time being happened to be a grainer!)—how many of these

* In the last number of the *British Critic* is a most admirable article on open roofs, well worthy the perusal of all who are interested in the revival of ancient ecclesiastical architecture.

fine roofs have been spoiled of their beautiful and appropriate decorations by the execrable fanaticism of the Puritan faction, who actually have made entries in the parish accounts of the cost of their demolition!—how many concealed from view by lath and plaster ceilings of miserable design tacked up under them!—and although a somewhat better spirit has at length arisen, still how many of these beautiful memorials of the piety and skill of our ancestors are yet being mutilated or utterly destroyed under the pretext of reparation!—a plea which is not unfrequently urged by those in authority for selling the lead and massive oak beams, the solid covering of antiquity, and substituting a plastered ceiling and meagre slates in their stead which detestable practice is still in full force in many parts of England.

rapidly disappearing to make way for monotonous plaster buildings, which are constructed also of wood; but as modern architects have not the skill to ornament that construction, the whole of the timbers are concealed by mock cornices and pilasters, so that the houses of modern Rouen have all the disadvantages of the old wooden buildings, without one particle of their beauty.

As gable-ends form most prominent features of the old buildings, and as they are continually attempted by modern Gothic builders, I will draw your attention to their real use, and then point out some of the egregious blunders frequently committed by modern architects when they attempt to introduce them.

The barge-boards of gables are intended to cover and preserve the ends of the purlins which projected over to shelter the front of the building.

The hip knop which terminated the ancient gables was in reality a king post fixed at the junction of the barge-boards, and into which they were tenanted. To the upper part of these was usually affixed a vane, and the bottom was finished off in the form of a pendant.

In modern gable ends the barge-boards are generally so slight and cut so open that they become mere skeletons, and utterly useless for the purpose for which they should be fixed, that

Example of Ornamented Construction in an Ancient Timber House.

of covering the timber ends. Again, the knop really useful at the apex of the gable is repeated in modern gables at the extremities, hanging down to an extravagant depth, and loaded with bunched finials and pendants.

Of these we may say with Puff in "The Critic," when he hears the three morning guns, "Give these fellows a good idea and they will work it to death." A king post in the centre of the gable is good, because it is really useful, but at the lower extremities these excrescences cannot serve any purpose except to add useless weight and unnecessary expense.

(To be continued.)

Not only do we find the construction of roofs ornamented, but there are numerous examples of common joist floors and the carrying beams which are rendered exceedingly beautiful by moulding and carving.*

In the ancient timbered houses of which such interesting examples yet remain in many of our old cities, especially at Coventry, York and Gloucester, we do not find a single feature introduced beyond the decoration of what was necessary for their substantial construction. What can be stronger, and at the same time more ornamental, than the curvilinear bracing by which due advantage was taken of crooked pieces of timber? The ancient French cities, Rouen, Beauvais, Abbeville, Liseux and others were full of timber houses covered with carved beams and most varied ornaments; but these are

* The ground of the ceiling of the Clopton Chantry, Long Melford, is azure; the stars are of lead, gilt; the inscription on the rafters is "Ihu Mercy, and Gramercy;" the arms on the shields are those belonging to different branches of the Clopton family, with their names inscribed beneath. The scripture on the large scroll is extracted from the Psalter, the whole richly painted.

THE ROMAN WALL.

SOME important excavations have lately been commenced on the line of the Roman Wall in Cumberland, under the superintendence of Professor Pelham, Mr. Haverfield and other Oxford archaeologists, acting in conjunction with the local antiquarian society. The first object of the excavators has been to explore the Vallum and to trace the connection between it and the Wall, and sections have been made accordingly at various places between Carlisle and Castlesteads. At Brunstock Park, about three miles east of Carlisle, trenches were dug from the north side of the Wall to the south of the Vallum, this being the first time such complete trenches have ever been dug. The foundations of the wall were discovered, and close behind it the appearance of a paved footway. A few paces further south the diggers came upon the Roman road which (as we now know) ran close behind the Wall. The road was made with large stones in the centre and on the kerb, a clay basis, and a packing of freestone and clay, with gravel above. Further to the south lay the Vallum, with its ditch and three mounds, and immediately to the north of it a small ditch not unlike the Gräbchen which the German excavators have lately

found on the Limes. At Whittemoss, Bleatarn and Chapelfield (near Irthington) other sections have been dug, with curious results. At Bleatarn a quarry has been traced, out of which the Wall was possibly constructed. In August further sections will be made in the eastern part of Cumberland, near Lanercost, and digging has also begun in Northumberland.

THE PROGRESS OF ARCHÆOLOGY.*

I SHOULD forfeit your good opinion of me if I did not confess to feeling embarrassed by the position in which, by your favour, I find myself. The honour and distinction of filling a chair which has been occupied by so many better men than myself is qualified with every doubt and difficulty. When I look round this room I see before me not only those gifted with greater knowledge than I possess, but who have had greater opportunities and have not had the work which they love continually interfered with by manifold cares and duties. You will accept this as my apology for the disinterested and elementary remarks which I shall enforce upon you. In selecting a subject on which to address you, I have felt it would not be profitable or interesting to merely index the progress of archæology during the last twelve months, nor to condense the county history of Shropshire into a necessarily dry and compressed guide to local antiquities which you must know better than I can know. I have thought it more profitable to devote a little time to-day to considering some of the methods of archæological research, as they have been enlarged and developed in late years, and condense some of the more general conclusions that have been reached, and more especially to illustrate them from my own desultory studies.

The Archæological Institute has always been a most catholic mother. Her aim and object has been, as far as possible, to give a picture of the sometimes gay and sometimes gloomy procession which our race has formed as it has tramped along the avenues of Time, from the land of mist and cloud to the land of darkness. Every fact, however recorded, whether invoked in words or graven in the universal language in which the ruins of art are enshrined, has been welcome, and it has taught the lesson that history means something more than philosophy and teaching by examples; it means painting the picture of the past, and piecing together the broken bits which have escaped. It was once the custom to despise some of these lessons. The antiquary was a connoisseur, whose studies were dominated by taste and not by knowledge. To admire, to study, and to review the masterpieces of Greek art, to do the same with the masterpieces of the Italian Renaissance, these were his aims. Phidias and Michel Angelo were his ideals. It was only when the tide was flowing highest that it was deemed profitable to study it. Hence the collections and the museums gathered in former centuries are so wanting in historic value. They represent the phases of taste as applied to the acts of other days, and the various measures and standards which the change of taste has created, sometimes inspired by nature alone and sometimes by nature bewigged and powdered. We have advanced from this position. We have learnt that the ebb as well as the flow of the tide is of supreme interest to us, perhaps of even more interest. Hence, while we admire and rejoice in some masterpiece like the *Hermes* of Praxiteles, we are constrained to devote a corresponding study to the rude bas-reliefs from the temples of Copan, and the ruder and more homely products of the old stone men. We can scarcely realise that hardly a generation has gone by when, at the British Museum, it was the fashion to admit only Classical antiquities as worthy of collection, and that the priceless treasures dug up by Faussett and Rolfe were treated as rubbish unworthy of a place in that sanctuary of the arts, and had to seek a home in a provincial museum. Fifty years ago a man who had devoted his time, his purse, and his knowledge to creating a worthy department of British antiquities would not have been rewarded with the Order of the Bath, but would have been treated by the students of the so-called high art as a barbarian and a Philistine fit only to consort with people like you and I.

We have changed all this, but its mischievous results still remain. If we go to the British Museum we shall find the noblest collection of Greek art in the world. Taken altogether it is quite unapproachable, thanks to the labours, the zeal and the taste of many good men, and notably of the late and the present curators of that department. But when we turn to Rome—Rome, the mother of modern Europe—Rome, the Britain of old days—the great type of practical good sense in government, the Rome whose roads and bridges, whose colonies and towns, whose laws and municipal institutions were only rivalled by our own, and which ruled the world for a thousand years and more, where are we to look for an adequate picture of the life her citizens led, of the vast colonial

dependencies, the controlled? We have a few fads; we have a room devoted to the antiquities of Roman Britain, and then we find the mistress of many legions, and the mother of us all treated everywhere as a sort of Cinderella to her more favoured sister Greece, a mere outhouse and barn attached to a Greek palace. Our contention is that there ought to be in our great museum, if not a special department of Roman antiquities, at least special rooms devoted to them, worthy of the fame of Rome and of its importance in human history. To many of us who love art but also love history, it is quite as important to know what where the surroundings of Tiberius and of Marcus Aurelius as of Pericles and Alexander the Great. What is true of the earlier Rome is much more true of Byzantium Rome—the Rome of the mosque of St. Sophia, the Rome which inspired St. Mark's at Venice, and the glorious buildings at Ravenna and Spalato, which shook hands with the East, and by this means wedded fresh ideas to those which were becoming stagnant. Because Gibbon entitled his work "The Decline and Fall of the Romans," we have now acquired an entirely mistaken perspective in regard to the part played by Byzantium in the history of art. Byzantium lived, thrived and flourished for a thousand years after the Goths had taken Rome. Nor are the code of Justinian, the histories of Procopius and Constantine, and the magnificent buildings all over the Ægean signals of decay and decrepitude, but the reverse, and yet, where are we to look for an adequate collection of objects to illustrate Byzantine art, its rich barbaric sarcophagi, its enamels, silver plate, &c.?

My object in naming these things is to point a moral. I am afraid the Old Adam, if he is not still among us, has left his shadow behind, and there remains much for this great and powerful body to urge and to press. Archæology is the study of history by its monuments, and not a branch of æsthetics. Let us by all means guard our taste and accumulate the highest and the best, but let us also be eclectic and catholic and realise that the highest and the best of all phases of art are of supreme value, and further that what we mean by history is not only the history of kings and armies of great nobles and great philosophers, and of the arts they patronised, but also that of the crowd, by whose continuous labour the world has been, and continues to be, subdued, and whose homely and prosaic surroundings have a dramatic interest of their own.

If this be one great lesson which the wider horizon of modern archæological study has taught us, another and an equally important one is that of the continuity of art. What Herbert Spencer and Darwin have pressed upon the students of natural history we antiquaries learnt long before in regard to art, namely, that there are no jerks and jumps in its history, but a continuous flow, and not only a continuous flow, but something more. It was formerly the notion that when art took an apparently new departure and became rejuvenated after a long period of stagnation, that it was a spontaneous movement from within. We now know that in almost every case this rejuvenescence was due to contact with some new ideas which came in from the outside. A new graft into the old tree was the real source of the better fruit. Let me take some examples.

When the Mongols, who were then masters of China, conquered Persia they imported great numbers of Persian workmen, and the result was a complete change in the decoration of Chinese porcelain. The vases made by the Moors at Majorca and Valencia were probably the immediate daughters of the art fabrics of Egypt, and were certainly the mothers of Italian majolica. The blaze of flowers and ribbons which suddenly broke out this year in the hats and bonnets of English women without any apparent motive can be traced to the influence of a famous city on the banks of the Seine, where an explanation is forthcoming. The Japanese are said to have lost their eye for form and colour because their old art has changed recently for the worse. They have been in part inoculated with European taste, as they have been flooded with European products. The story is apparently universal. We see the river come out of its mountain fountain and flow down blue and sparkling. Presently we find the colour of its waters change to milky white, and realise the explanation when we trace the new colour to some effluent watering another soil which has come and joined its waters, and sometimes, as in the case of the Rhone after it enters the Lake of Geneva, the milky and the blue streams flow side by side, as the bonnets and hats of every fantastic shape and colour are mingled with older and more chaste designs on older and more sensible people. The great lesson of all is continuity.

Again, to take another illustration from natural history, a lesson of these later times in archæology has been that of "survival." We find all kinds of archaic survivals in our speech, in our fairy stories, in our clothes—everywhere, in fact, are crystallised boulders of older strata of human life, which have been accidentally preserved in another matrix, and to those who are willing to read their lesson bring, in fact, unmistakable features of another time. When we see the Italian peasant going on pilgrimages to different altars of Our Lady to be cured of different human ills, are we not reminded of the

* An address delivered by Sir Henry Howorth at the annual meeting of the Royal Archæological Institute at Shrewsbury.

similar practices in an age when Venus and her shrines were scattered over the same country and each shrine had its own Venus, just as each altar has its own "Lady" endowed with different sorts of powers? How curious it is to go to a kermesse in some old Dutch town such as Middelburg or Delft and to see the women with their curiously-shaped lace caps, and to be told that it is still quite possible to distinguish the Roman Catholic families from the Protestant ones, the distinction in the caps having arisen in the purer days of the sixteenth century, and then to turn to the bags full of curiously-shaped and coloured cakes sold in the booths, and to the roundabouts and rude swing-boats loaded with perfectly sane people, many of them sixty or seventy years old, and then to turn to Teniers's great pictures at Amsterdam and to see precisely the same cakes and the same roundabouts figured there. Are not the wooden houses coloured red ochre which dot the country the very same as were introduced by the Dutch there in the grand old days of the Norwegian herring fishing in the seventeenth century? Are not the bull-fights in Spain direct survivals of the exhibitions in the circus, no doubt introduced everywhere by the Romans, Spain having preserved its Roman colours more than any other European community, just as Spain was the most essentially Roman of all the colonies? Have we not our own fossil customs everywhere? The aldermen and common councillors of London when decked in their State robes might be living in the Plantagenet times. The beef-eating in the time of Henry VIII., the two ridiculous buttons at the back of our coats and the bands we barristers wear are useless relics of our useful garments, some dating from the time when the necessity of buttoning back the flaps of the long coats when George III. was king, and the other remains of the long collars of King James's time. Are not our judges' wigs directly traceable to the baldness of Louis XIV.? These useless things, like the many useless and monstrous and offensive adjectives used by cabmen and sometimes by school-boys, are merely survivals of things once usefully put on. The games played by school children in the gutter preserve the ritual of primæval worship and the social customs of primæval times.

Hence, as I have always urged, it becomes important and interesting not only to trace the origin of things, but also their final departure. Our dictionary makers are most diligent hunters of the first usage of words. Would it not be wise if they were also to record the last use of obsolete words, the dying flicker of a living light? The very fact we are referring to has sometimes pervaded archaeological reasoning. Because the Shetland islanders still use stone lamps and cups it does not follow, as some have urged, that a stone age in Britain is entirely a mistake. It only means, of course, that in the remote corners the very old art has lived on, just as with the names of the old mountains and rivers, the language of the earliest inhabitants has frequently been preserved. Their touches of moral poetry in our very prosaic lives are as much fossil relics of an old historical horizon as the remains which have been found by German geologists in the far-travelled limestone boulders which strew their country and belong to an age not directly represented in the solid strata of their land. The lessons we are discussing are notably prominent in the more recent works on philology, in which loan words and terms foreign to the language have been carefully rifled out, and we have thus been enabled to find not only the origin of many acts and customs, but the stage of culture at which different connected races had arrived at the time when they separated, by comparing their common names for homely or other objects. The same with folklore and the same with the rituals of different religions, all of them being among the most conservative of institutions. This multiplication of avenues by which to approach the thoughts and works of the old men has, no doubt, made our inquiry more complicated and difficult, but it has at the same time made the materials almost inexhaustible and the possibility of solving problems once deemed insoluble much more hopeful.

Let us now turn to some of the concrete results which our more powerful analysis has enabled us to compass. In the first place we have learnt that it is a mistake to confuse art with race. We cannot change our race, that is indelibly stamped upon us by nature; but art—art of every kind, including language, is not an inheritance from nature, but is as much acquired as our hats and coats. We learn all our arts. Hence we must be perpetually on our guard against the fallacy that because art has taken a new departure therefore we are in the presence of a new race. Again, we have learnt to beware of the wide-reaching, industrious and largely imaginative conclusions of a former race of archaeologists. Archaeology is a science which can only be profitably studied on inductive methods. Of this a very notable instance is the discussion on the "Origin of Man," a subject upon which there was much speculation twenty-five years ago. It has not the same living interest for us now. The fact is we realise that materials are wanting at present to enable us to carry the study very far in this direction, and the newly-fledged hopes of a quarter of a

century ago have not fructified. The origin of the human race, so far as archaeological research goes, is absolutely beyond our ken, and those who are determined to reach some result in that direction must go to the geologist for their facts and for their arguments.

The moral of the archaeological vista is this. We can take up the various specialised and elaborated civilisations which men have produced, and trace them up to simpler and less specialised forms. We can enumerate the tangle created by their mutual influence upon each other, and trace the enormous changes due to the gradual introduction of ideas and new processes, new weapons and new tools. We can trace the complicated pedigree until we reach an age when all men used very similar materials, and had very similar arts. The cramping influence of having to use them with often stubborn materials, compelled a wanting of form and of ornament which is in itself bewildering. Eventually we reach a stage where it is most difficult to discriminate among races or their characteristics by their art alone. For example, the polished stone axes left by the Caribs, then found in some parts of Europe, and then found in some parts of Eastern Asia, are almost indistinguishable. Yet how widely separated these races are in every respect. We may thus be only too easily deceived in supposing that we are getting nearer the solution of the problem of the origin of man, when our goal is the inevitable one that with his primitive weapons primitive man in many latitudes was constrained to surround himself with very similar surroundings.

A corrective to this is speedily reached when we turn to other fields of research, such as language and mythology and physical constitution. We can trace back the languages of Egypt, of Babylonia, of India and China for a long distance beyond the occurrence of regular annals in those countries; back, in fact, to the stone age in each, and similarly with the mythology, and the result is that instead of apparently reaching a common origin and common elements in them, the gap between them sometimes seems to get wider as we go further back, until we have to confess that if there was a common fountain to the various streams it must have been at a period so remote that we have no materials at present by which to trace them to it. The men who wrote the Book of the Dead, those who wrote the Epic of Sargon the First, those who wrote the Vedas, and those who wrote the Chinese classics, if they were descended, as we believe, from common parents, must have been isolated from each other for a long period in order to become so differential. At such an early date these are mere samples only. If we range further afield we shall find the same lesson meeting us everywhere. It is said that among the Indians of North and South America there are ninety languages spoken which are unintelligible to each other. The same problem meets us in the Caucasus, in Siberia, in Indo-China and elsewhere. The existence of these languages is a perpetual warning to us to be careful of dogmatism. How can we explain them except by postulating a long period, during which they have been gradually diverging from each other? We cannot measure this period by any scale or measure. When we compare Icelander with Norwegian, and remember how long ago it is that Iceland was colonised—when we compare the Mongol language, still spoken by the Buriats in Mongdin, with the language of the letters of the Mongol Khans written to the French kings in the thirteenth century, we shall have a measure of the slowness with which these changes sometimes occur. If it has taken sixteen centuries to convert Latin into the various Roman languages, how long has it taken for the diversion of the various Aryan forms of speech from their mothers' language, and how much longer to converge the Aryan, Semitic and other families of language upon a common mother? The very question is full of romantic difficulty; assuredly we are a long way from any satisfactory answer to it.

The evidence of language and of mythology is supplemented and confirmed by that of the physical features of our race—features which seem to be so conservative and so difficult to alter. If we examine the very earliest features which have been preserved in the tombs of Egypt we shall find representatives of the various races which then bordered the valley of the Nile, and we shall find that in features and in physique they are undistinguishable from the tribes still occupying the same districts. The negro, the Nubian, the Coptic Felaheen, the Semitic inhabitants of Palestine and Arabia are there pictured as we know them now. The earliest monuments of Babylonia speak the same language and discriminate clearly the various types of men in Mesopotamia. It is so with the early monuments of China, of India, of Mexico and Peru, and of the borders of the Mediterranean, and this evidence of the monuments is supported by the shapes and contours of the skulls which have been found in the earliest graves, and which show not merely sporadic variation, but variation affecting great classes. All this assuredly requires us to postulate a long period during which fresh changes were incubating and were being carried forward. We have no means of knowing how long this was. We can only very naturally conclude that since so little change has taken

place during the last 4,000 years in the languages, the customs and physical features of so many different races, we must go back a long way if we are to explain the varieties as they exist. We have no chronology of any kind for these misty regions. Dates entirely fail us. In Egypt and in Babylonia anything like positive chronological data fail about 2,500 B.C., while, as you know, the Bible dates are, before a certain period, not only based upon those of Babylonia, but they have been preserved in an entirely different shape in the Masoretic, the Samaritan and the Septuagint versions, and there is no means of rectifying them. All we can say is that the Masoretic numbers, upon which Archbishop Usher's chronology was based, and which was the basis of the calculation in the margins of our Bibles, are the least trustworthy of all, and can be shown to have been sophisticated and altered.

If I may be pardoned for referring to a work of my own in this behalf, namely, that which I have entitled "The Mammoth and the Flood," I claim to have shown that all the evidence we possess—geological, palæontological and archæological—converges with singular force upon one conclusion, namely, that at the verge of human history there was a great and widespread catastrophe, which overwhelmed a large part of the temperate regions of the earth and which caused great destruction of men and animals. This widespread catastrophe has left its mark upon the traditions of many and widely-scattered peoples. It possibly accounts for the isolation of many races in our own day, notably in districts without great natural frontiers, which isolation is due in all probability to the destruction of intervening links between the various human colonies which survived. It is a remarkable proof of this catastrophe that whereas man is the most elastic of creatures in his capacity for facing and overcoming difficulties, there is nevertheless an absolute gap in his history in large areas in Europe unbridged by any remains or by any evidence. How are we to explain this? Once man has occupied the ground he is not likely to abandon it entirely and suddenly. Wherever we find one set of men driving out and superseding another, we have evidence of gradual change (of overlapping). In the hill forts of Dorset we have Roman remains mixed with those of the Britons. In the Kentish cemeteries we have Roman remains mixed with Saxon. In the case before us, however, it is not only human art which shows a gap, but a whole fauna suddenly changes. Not a single mammoth or a rhinoceros has ever occurred with the remains of a domesticated animal. Since there are no traces of a transition, it is clear one set of men and animals did not absorb the other. To myself this sudden hiatus and gap means the occurrence of some sudden and widespread catastrophe which desolated a wide area, and destroyed its living creatures in great numbers, and the recolonisation of the wasted area by a migration from elsewhere. To this great catastrophe the traditions of mankind go back, as do the geological references we can collect. It forms the great divide in early human history. We must not, however, be misled. Some wild writers have argued as if human beings were quite different in kind before and after the divide. I see no evidence whatever of this. The human skulls found with the remains of extinct animals by Lund in the caverns of Brazil have all the characters of Indian skulls, while those found with the extinct animals in Europe have the characters of European skulls, thus showing that at this period the native races of America and of Europe had already been differentiated, and it is extremely probable that the so-called palæolithic, or, as I may prefer to call them, the antediluvial men of Europe did not belong to one race, but to several races. Those who find certain resemblances to Simian skulls in those of antediluvial man overlook the power of drawing shown in the etchings of animals on pieces of bone found in the French caves, for it is quite unmatched in after times until we reach a much later period, while the harpoons, the needles, &c., are most skillfully fashioned. Whether the Simian origin of man be a fact or not, it is clear we have no evidence in archæology as yet to bridge the gap.

If we want a key to the whole position we must turn our backs upon civilised man and explore the fertile fields of ethnography and the multiform types which we find among savage and semi-savage races. Many of these have survived from the time before the great catastrophe which did not in part affect the tropics. In these latitudes we can find abundant material to study, but man had with very rude tools fashioned for himself very respectable surroundings. These various tribes of savages are generally ignored as we study history and archæology. No greater mistake could be made. Assuredly they present us with survivals on a great scale by which we can measure and test the phases of human progress in its earlier stages, and sometime perhaps we may be able to get them all into one pedigree, and to show how a real continuity combines them all. Two lessons of great moment we may learn from them. One is that all these varieties of language, of ornament, of dress must have taken a very long time to develop, and secondly when we come into actual contact with them we are struck by the further fact that they are desperately conservative.

The so-called ring-money which marks one of the very early chapters of our archæological history, still survives in North-Eastern Africa. The ornaments and the customs of ancient Egypt may be still found lying in the Western Soudan and among the tribes of Ashanti, while, if we turn to Australia and Tasmania, we shall find human arts still in their very infancy, and so far as we know and can judge, the arts of these races have remained unchanged and unaltered since those primitive times when the Australians first introduced the dog into Australia, which means when the extinct Australian animals were still living, while we shall find among the very backward Bushmen and Esquimaux a power of designing animals, &c., comparable to that of the cave men, and languages remarkable for their structure and capacity. A third lesson which we learn is that it is quite possible, and in fact an everyday occurrence, for two civilisations which have reached very different stages to coexist alongside of each other contemporaneously in the same area, a portion in different areas. The Australian and the Englishman live alongside of each other, as the Lapp and the Norwegian, nay, to come nearer home, as the gipsy and sedentary Oxford professor, and we are led from this fact to the induction which has been too often forgotten or overlooked, that the same thing must always have been.

We talk of a stone age, of a bronze age and of an iron age, and they are excellent terms when we apply them to some particular area like Scandinavia, to which they were first applied; but they are misleading when universally applied. Many savages are still living, or were quite recently, in the stone age, the shell age, or the wooden age, like the Australians, the Marquisan Islanders and the Indians of the Amazons, while alongside of them were living the emigrants from Europe, who were not only living in the iron age, but had learnt to harness steam to iron, and to multiply human labour tenfold. Not only so, but it is obvious that in such cases there may be a great jump in civilisation from a very low to a very high step on the ladder without the necessity or the possibility even of intermediate steps. A bronze age or a copper age is not at all likely to intervene between the hewers of rude stones or of polished stones in the Pacific and many parts of America; and, in fact, it may be said that the stage we sometimes associate with palæolithic man (very wrongly, as I think), namely, that in which the Tasmanians and Australians lately lived, may be immediately followed by an iron age. I say wrongly because we cannot argue that the men who lived in our prehistoric caves and were contemporaries of the mammoth, whose portrait they scratched on ivory, were the same race themselves as the low type of men discovered in Tasmania. Diogenes was a philosopher and not a dog, as he called himself, although he lived in something very like a kennel, and the men who invented and elaborated the Vedanta philosophy, although living with the simplest surroundings, are not to be measured with the unbeloved and unreclaimed wild hunters of the Kurdi mountains, among whom the arts of life were at least as much advanced.

(To be concluded.)

THE SURREY ARCHÆOLOGICAL SOCIETY.

AT the annual excursion of the Surrey Archæological Society some forty or fifty members met at the Farnham railway station for the purpose of exploring objects of antiquarian interest in this beautiful part of the "hop country." Mr. Mill Stevenson, hon. secretary, had six or seven brakes to meet the members and friends arriving at 11.45 at the station, and quarter of an hour later they were *en route* on a visit of inspection to the historical churches of Bentley, Froyle and Cron dall. The party included Dr. Chambers, Messrs. H. M. Robson, J. F. Eastwood (Esher), T. W. Stevens, C. F. H. Lewes, T. M. Clark, C. F. Hayward, A. J. Style, A. Sprung, W. Wien, B. F. L. Potts, F. Price, Mill Stevenson (hon. secretary), C. Ekin, A. M. Cook, Ambrose Cook, T. Howse, F. Vanderpant, H. W. Vanderpant, J. Durham (St. Gabriel's, Surbiton), R. G. Price, W. F. Potter (Peckham), and a large number of ladies. Passing Alice Holt Woods Pottery Works, Bentley Church was reached about one o'clock, where the rector, the Rev. O. C. Lang, acted as conductor. Dealing with the early history of the church from his own observation, Mr. Lang said he was not aware of a record in Domesday Book stating that there was a church there of an earlier period, but when constructing a drain on the north side of the churchyard a concrete foundation was discovered which seemed to point to some earlier building. The older part of the present church, he supposed, dated from 1120 or 1130, this being also the time of the founding of Waverley Abbey. When the work of renovation took place on the last occasion it was observed that the west wall of the north aisle contained many fragments of Norman capitals (upon which were some pretty scrollwork) and mouldings, and the Norman font was also recovered, although it was very much injured. Referring to the glass found in the east chancel window, the

speaker said it had been pronounced to be beautiful English work of about 1450. He concluded by giving interesting details of the bells, the brasses and the monuments, and said the parish register dated back from 1539 and was in good order. An adjournment was made to the Red Lion Inn for refreshments. The journey was continued through magnificent country, and at about quarter to three the brakes were again forsaken for an inspection of Froyle Church. This edifice consists of a chancel and large nave, the latter, together with the tower, being rebuilt towards the end of the last century in 1772. Portions of the chancel had been destroyed completely. The principal historic part of the building is the stained-glass window in the east side, which dates back from 1360 to 1380, and consists of numerous coats-of-arms.

Mr. Stevenson was of opinion that it had the finest display of heraldry in the whole of Hampshire. He also mentioned that it was intended, when they came to Froyle, to visit the park, where, it was reported to him, was a house which existed in the time of Charles I. From observations he had made, however, he was sorry to find there was nothing to convince him that the house was occupied in those days. Leaving Froyle, Crondal Church was reached, where the party again alighted, and were escorted around the building by the Rev. M. C. Baynes, who read a paper on the church (a late Norman building) and its traditions, and explained how it suffered under Cromwell.

Mr. Stevenson considered that many things had been attributed to Cromwell which he never took a hand in. They could rest assured that if Cromwell and his soldiers desired to do anything to the church they would have erased it from the earth altogether. He was under the impression that the depredations complained of by Mr. Baynes must have taken place in the Georgian reign.

Mr. Hayward suggested that some of the younger members should visit the church to work up its history thoroughly, and to get the result of their investigations published for the benefit of the Society.

Mr. Stevenson reminded Mr. Hayward that Crondall was in Hampshire, and in going so far as they did the members of the Surrey society were already trespassing.

The party then returned to Farnham, after having spent a most enjoyable day, and partook of a cold luncheon at the Bush Hotel. Mr. J. F. Eastwood presided, and, after the loyal toasts, proposed "Success to the Surrey Archaeological Society," coupling with the toast the names of Mr. Mill Stevenson and his colleague, the Rev. T. S. Cooper, who was absent. The churches they had visited afforded them much interest, and he suggested that some of the members should pay Crondall Church a purpose visit for the collection of further particulars. The thanks of the members were due to Mr. Stevenson for the arrangements he had made for the excursion.

THE NILE RESERVOIR.

A MEMORIAL has been recently forwarded from the Society for the Preservation of the Monuments of Ancient Egypt to Nubar Pasha, in which the signatories, which include a large number of representative authors, men of science, artists and others in public positions, state that inasmuch as the monuments of Egypt are the interest of the whole world, they desire to recall to his Excellency's attention the facts which have been published in the admirable study on the subject of "Perennial Irrigation" by the Under-Secretary of State for Public Works, a report which has opened a magnificent prospect of increased prosperity to Egypt, at which they most heartily rejoice. "We remark," they continue, "that the Technical Commission have recommended the construction of a reservoir dam at Assouan which will submerge the largest and most important parts of Nubia and ruin the temples of Daboud, Gertasseh, Tafah, Kalabsheh, Dakkeh and Aff-ed-Donieh, as well as the towns, cemeteries and other remains of this region, besides leading to the removal or ruin of the various temples of Philæ, which are some of the most beautiful monuments in Egypt. We therefore express to your Excellency our deep regret at the recommended construction of a reservoir at Assouan which will cause such results, so unhappy for science and art; and we trust that some other project will be considered in order to reconcile the interests of agriculture with those of art, history and archaeology. We hope that before the immediate season for action arrives some efficient scheme may be adopted which will avoid so far as possible the destruction of valuable monuments. We do not wish to express our opinion as to the best manner of carrying out the important object of improving the irrigation of Egypt, as this is a point for the Egyptian Government; but we would venture to ask whether it is not possible that an equally good site may be found at some place south of the second cataract, when, as it is to be hoped, the country may again be reopened in a few years to civilisation under the rule of Egypt." Besides the foregoing memorial to Nubar Pasha from England, Scotland and Ireland,

others of similar tenor and purpose have been prepared in France and sent forward by the Académie des Inscriptions and by about 250 of the foremost members of the Institut de France. In Germany about 600 distinguished persons, including Egyptologists, professors, artists, antiquaries, archaeologists and literary men, have joined in a very strong protest against the submersion of Philæ.

GENERAL.

The French Minister of Fine Arts has appointed M. Charles Yriarte and M. Henri Havard to be inspectors-general in his department.

An Alteration in the rules of the Sheffield Society of Architects and Surveyors has been agreed to, and henceforth, in addition to the three classes of members, viz. fellows, associates and students, a fourth class of honorary members, not practising as architects and surveyors, may be admitted.

A Leipzig Amateur has given 60,000 francs towards the erection of the monument of Schumann, the composer, which can now be undertaken.

"Chaldea to Canterbury" is the title of a series of university extension lectures which will be delivered in Melbourne by Mr. A. Henderson, C.E.

The Late Sir A. H. Layard has bequeathed the portrait of his uncle, Benjamin Austen, by Sir M. A. Shee, P.R.A., to the Incorporated Law Society. All his other pictures (excepting portraits) are to be offered to the trustees of the National Gallery.

The Annual Meeting of the Kent Archaeological Society was held at Faversham on Tuesday, under the presidency of Earl Stanhope. There were visits to the parish church, the grammar school, Davington Priory and Preston Church.

Messrs. Debenham, Tewson, Farmer & Bridgewater have sold the site of the church of All Hallows the Great in Upper Thames Street to Alderman Sir Francis Truscott for 13,100*l.* The money will be devoted to the erection of a church in the St. Pancras district.

The London County Council intend to erect residences for 664 people in Goldsmith's Row and Cable Street, at an outlay of 25,833*l.*, "without the intervention of a contractor."

The Norwich Castle Museum will be opened by the Duke and Duchess of York in October.

A Model of M. Falguière's group, *The Republic overcoming the Monarchy*, has been set up in the Panthéon, Paris, in the place formerly occupied by the high altar.

Dr. R. Rowand Anderson recently had a conference with a sub-committee of the Lord Provost's committee as to the vote from the Residue Grant to the School of Applied Art. Hitherto 1,000*l.* has been given, a sum which it is desired should be continued, but no resolution was arrived at as to the allocation of the money.

Mr. Osler, treasurer of the Public Picture Gallery Fund, has offered to the Birmingham Corporation, for the Art Gallery, an original sketch, called *The Old Gate*, by the late Fred Walker, A.R.A.; and a letter was also read from Mr. W. B. Avery, offering the Corporation a portrait of his uncle, the late Mr. Thomas Avery, to be hung in the Council House. Both gifts were accepted.

An Anonymous Donor, it is stated, has given the sum of 1,000*l.* to the Fathers of the Oratory towards the completion of the church at Brompton.

Messrs. Clark & Moscrop have been appointed architects for the new Board schools in Corporation Road, Darlington. In the competition among local architects they gained the first and second places. Mr. G. G. Hoskins obtained third place, Mr. Frank Martin fourth, and Messrs. Pritchett fifth.

Professor Banister Fletcher has been nominated by the City Commission of Sewers to represent that body at the Congress of Hygiene in Buda Pest.

Lord Calthorpe and his son have made over Calthorpe Park in perpetuity to the Birmingham city authorities.

The Glastonbury Antiquarian Society have just made an excursion to Westbury-sub-Mendip, and inspected the parish church. Rodney Stoke and Cheddar were afterwards visited.

The Annual Meeting of the Somersetshire Archaeological and Natural History Society will take place at Langport on August 18 and two following days, under the presidency of Mr. E. B. Cely Trevilian. The excursions will be under the direction of Lieut.-Col. J. R. Bramble, and Mr. Edmund Buckle will describe the architectural features of the places to be visited.

Mr. E. Seward has been appointed architect for the exhibition buildings which are about to be erected in Cardiff.

The Architect.

THE WEEK.

THE action taken by Mr. L. O. WILLIAMS, of Liverpool, for the recovery of 130*l.* for the preparation of plans, specification, quantities, &c., which was tried before Mr. Justice BRUCE on Wednesday, did not end satisfactorily. The defendant, Mr. RAE, an estate agent, asked Mr. WILLIAMS to prepare plans for two villas at Liscard, which were to cost only 1,200*l.*, although a rent of 60*l.* was expected to be obtained for each of them. Alterations were made in the plans in spite of the plaintiff's warning that the cost must be increased. The last tender received amounted to 2,100*l.* The defendant expressed an intention of allowing the scheme to drop, but it was alleged that the villas were in progress according to the plaintiff's plan. The claim was based on 2½ per cent. on lowest tender for plans, ¼ per cent. for obtaining tenders, besides 53*l.* for the quantities. The defendant's case was that his limit of cost was 1,200*l.*, and that he was never informed that his suggestions for improvement in the plans would involve greater expenditure. The plans were no use to him. He could not build up to them, and it was not true he was using them. Evidence for the plaintiff went to prove that the kind of houses required by the defendant could not be built for 1,200*l.*, and that plaintiff was entitled to what he had charged; and for the defendant to show that considering that no tender had been accepted plaintiff was not entitled to the percentages charged. The jury were two hours engaged in considering the case, but as they could not agree they were discharged.

A STATEMENT by Sir J. D. LINTON and Mr. ORROCK about the decay of British pictures in the National Gallery is almost alarming. It is to be expected that an excessive use of asphaltum does not insure permanence; but the two artists declare that on July 31 the pigment was "running." They mention as examples of deterioration WILKIE'S *Blind Fiddler*, *Village Festival* and *Knox Reading the Bible*; STOTHARD'S *Greek Vintage*; STANFIELD'S *Zuyder Zee*; TURNER'S *Orvieto*, *Apollo and Daphne*, *Child Harold's Pilgrimage*; CONSTABLE'S *Valley Farm*. LESLIE'S *Uncle Toby* and *Widow Wadman* has also suffered; but "some housepainter's work" was placed in the deepest cracks and gashes of it, as well as in other paintings. Sir J. D. LINTON and Mr. ORROCK assert that the evil is remediable. They say there are thousands of English pictures in which asphaltum has been used which have not run, simply because they have not been subjected to a high temperature. They found that on July 31 the temperature of some of the British galleries was about 75 deg. The mean temperature of dwelling-houses is 60 deg., whereas in the National Gallery a greater heat, and a dry heat, prevails. This is the chief cause of the evil. They believe that a certain amount of moisture in the air, under the influence of a gentle draught, would save the British pictures. This process will even prevent an asphalt pavement from bubbling under a burning sun. They ask therefore, Why should water, in grated troughs, for instance, not be used to temper the hot air, and even refrigerators provided to secure an average temperature? The subject is important. The late director could be seen at all hours in the Gallery scrutinising the treasures, and his successor, we are confident, will be no less anxious. But as the decay has attained some magnitude the trustees would do well to seek the advice of a committee of experts. If the temperature and dry air are the causes there ought to be little difficulty in finding a remedy to abate their power.

MR. E. C. BOOTH, who died on Friday last, was, according to the *Leeds Mercury*, probably the oldest of the present generation of Leeds artists, having been born so far back as 1827. MR. BOOTH studied at the Leeds School of Art, and subsequently with the late THOMAS SUTCLIFFE. His name became known to the public on his first exhibiting at the Royal Academy, when Mr. RUSKIN was bringing out his yearly "Notes" on some of the principal pictures.

It was in one of these pamphlets that Mr. BOOTH'S picture, *The Roadside Spring*, was noticed, and of which—in consequence of its position (much below the line)—Mr. RUSKIN said, "You must examine it kneeling—there is no other way." Though commencing as an oil-colour painter, Mr. BOOTH devoted himself mostly to water-colours later in life. His work was always conscientious and truthful to nature, and it might be justly said that in many instances he put more work into one of his pictures than would have served for several in the hands of most artists. Of a retiring disposition and very delicate constitution, Mr. BOOTH did not achieve that celebrity which many others with probably less talent but of more robust health would have easily obtained.

THE twenty-five sets of designs for the proposed Local Board offices, fire-engine station, stables, &c., at Littleborough were submitted to Messrs. WOODHOUSE & WILLOUGHBY, of Manchester, for report. The assessors have testified to the general merit of the designs, which increased the difficulty of arriving at an equitable decision. The first place was assigned to design No. 23. The grounds for selection were:—(1) Adherence to conditions; (2) simplicity and regularity of planning; (3) ample and diffused light throughout; (4) the rectangularity of the rooms; (5) excellence of proportions of offices, staircases, corridors, &c.; (6) arrangement of lavatory accommodation at back of building, being isolated by a "blow-through" ante; (7) picturesque elevations; (8) keeping down of superficial areas throughout; (9) economical utilisation of yard space at back. It was found that No. 23 was the work of Messrs. CLARK & HUTCHINSON, of 28 John Street, Bedford Row, W.C. The second place was assigned to design No. 14A, by Messrs. DUNCAN & BUTTERWORTH, of Rochdale, and the third place to design No. 3, by Mr. CHARLES T. TAYLOR, A.R.I.B.A., Oldham, both being "very commendable schemes." The Local Board have adopted the assessors' recommendations.

THE annual meeting of the Somersetshire Archæological and Natural History Society will be held at Langport on Tuesday, Wednesday and Thursday in next week, under the presidency of Mr. E. B. CELY TREVILIAN. Among the buildings visited will be the parish church, Langport, the chapel of St. Mary, Huish parish church, Castle Dyke, Cathanger Manor-house, Isle Abbots Church, Langford House, Swell Church, Court House, Curry Rivel Church, Muchelney Church and Abbey, Low Ham Church and Manor-house, High Ham Church, Aller Church, Somerton Church, Long Sutton Church and Kingsbury Episcopi Church. Mr. EDMUND BUCKLE will describe the architectural features of the buildings.

AUGUSTE CAIN, the French sculptor, might be considered as a sort of successor of BARYE in the representation of animal forms. Work of that class obtains more admiration in France than in England. CAIN was not satisfied with lithe and active beings like lions and tigers; he also attempted, and with success, to employ the rhinoceros and crocodile in his groups. He made no concealment of animal ferocity. AUGUSTE CAIN was born in 1822, and was the son of a poor soldier. When he was ten he was apprenticed to a decorator. He was fortunate in obtaining admission to the ateliers of RUDE and BARYE, for he could not find masters among all the sculptors who were better adapted to develop his genius. BARYE was mainly dependent on the manufacturing bronzists, and he introduced CAIN to his patrons. The young sculptor was not satisfied to spend his life modelling paper weights and ornaments for the table and chimneypiece. His ambition was to produce works on a grand scale for the adornment of public gardens and buildings. In 1864 he was able to obtain a medal for a figure of a lioness, and the authorities were not slow in offering him commissions. His *Tiger Strangling a Crocodile* and *Tigers Attacking a Rhinoceros* are known to all visitors to Paris. The Duc D'AUMALE employed his talent for groups suggestive of the chase at Chantilly, and CAIN became in a few years one of the representative sculptors of France.

THE SCIENCE AND ART DEPARTMENT.

THE sight of a brave man struggling with misfortunes was, if the school books are correct, gratifying to the old gods, but if the Olympians still existed they would be likely to admire even more the efforts of a minister who endeavours to reform one of the English Government offices. Strong statesmen have been overcome repeatedly in efforts of that kind, and have concluded that ordinary courage is not equal to undertake a duty before which HERCULES himself would hesitate. The country has therefore reason to be grateful to Mr. ACLAND who, after two years' encounters, has not abandoned the contest with South Kensington officialdom. It will be said perhaps that his exertions have not produced much gain; that was inevitable. If we remember how numerous are the people not only at South Kensington but all over the country who believe it is their interest to uphold the existing system because they derive profit from the defects, it will be evident that the most zealous minister cannot overcome or convert them unless by degrees. There is no trumpet which can make the Department's ramparts fall at a sound. The abuses have become consolidated by time and negligence and they are not to be overcome without the help of years.

The new report of the Science and Art Department is, however, evidence that already something has been gained. There is, for instance, more than the average amount of plain speaking about the weakness of what is accepted as "science" and "art." Lord ROSEBURY and Mr. ACLAND, in explaining their reasons for the appointment of the thirteen new inspectors, testify that "in some subjects of science aided by the Department, we are of opinion that the instruction given is not sufficiently practical," a conclusion which, if tardy, is creditable to the official understanding. Unofficial Britain was sorrowfully aware of that fact for a great many years. They also admit that what are supposed to be organised science schools in which education is not apparently circumscribed by an official syllabus are degenerating under the influence of one of the evils created by the Department, for the President and Vice-President confess that "so long as the present system of payment on results is adhered to in its entirety, there is a danger of the neglect of those subjects which are not included in the Department's directory, and of their being made subordinate to instead of co-ordinate with them." In other words, the Department is not satisfied with retarding the education of the students in the official schools, but is endeavouring to bring about a similar result elsewhere, in order that the whole country shall be of a uniform incapacity. For a school to be affiliated with the Department may be an advantage financially, but unless Mr. ACLAND succeeds in attaining a reform, it is not an educational advantage for the students.

To dream of that reform requires extraordinary courage and public spirit. The reports which some examiners have prepared on the works of the students in the classes of the Department are enough to make any man disheartened. It is no wonder so many presidents and vice-presidents have been afraid to meddle with so appalling a condition of mismanagement. Let us take a few examples from those parts of the reports which are supposed to have general interest. Of the "Freehand Drawing of Ornament" it is said "many drawings are so bad that it is evident that some students who attempted this examination are quite unprepared to sit for the advanced stage," and the "prevailing defects are those of false proportion in leading curves and masses, of non-continuity in curvature, and lack of character in foliage." The examiner in Perspective says he is sorry "to have to report that several of the papers bear evidence of cramming." In Elementary Design the students appeared incompetent to understand plain instructions, and sometimes, in consequence, "it is only through faith in the good intentions of the candidate we could give any marks." In Advanced Design there was not any ability that was very remarkable for wall-papers, although the subject is one to encourage an exhibition of talent; while the schemes for the decoration of a school wall submitted by the candidates for honours "showed, generally speaking, a want of sense of scale in ornament and architectural proportion, and a very imperfect perception of the ornamental use of figures, as well as want of power of drawing the same." The examiner in

Anatomy was amazed when he found so few students could answer a question about proportion. "This is to me," he says, "the more remarkable, as I would have thought that this was essentially a matter of importance to the art student, and one a knowledge of which he might reasonably have been expected to possess; the more so as 'proportion' is an important topic, coming within the province of many studies in art besides that of anatomy." There are some sections in which a more creditable average of production was submitted; but, so far as can be ascertained from the report, the larger part of the work sent in for examination was faulty.

The reasons are not far to seek. The latest report is the forty-first, and when a bad method is allowed to continue for forty years an amendment is not easy. All the teachers were brought up according to that method, and they have had no chance of testing one of a different character. Every year, too, prominent men have come forward and made orations about the official method and the enormous amount of good which the country was deriving from the schools. Worse than that, artists have been discovered who readily allow themselves to be set up as the approving witnesses of all the operations, if not as examples of the products which are turned out. There are signs that Mr. ACLAND can realise the true value, not only of the teaching but of the endorsement it has received, and if we could suppose his tenure of office was likely to last for a couple of years longer, there would be grounds for anticipating a reform.

When so much is unsatisfactory about the drawings, models and other works of art, as well as about the answering in science, the increase in the number of schools and classes and in the students attending them cannot give rise to much congratulation among those who have rational views of the purpose of education. To many people the most satisfactory sentence in the report is the announcement that "many classes in which instruction of a very elementary nature had been given were closed or ceased to have any connection with the Department." If the same process were applied to classes in which "the instruction given is not sufficiently practical," it would be advantageous not only for the country but for science and art also.

The necessity for some revolution in the teaching as well as in the administration is shown by a few figures more emphatically than by any other form of demonstration. In the examinations of the science schools in 1892 there were 203,347 papers worked, and the failures were 66,569, or less than a third of the number. Last year only 201,597 papers were worked, but the failures rose to 118,086, or considerably over one-half. In art there was little compensation for the collapse of the science students, for out of 141,581 papers worked, 79,428, or eight-fourteenths of the total, were failures, while in the preceding year there were 72,001 failures upon 126,143 papers, or, say, seven-twelfths of the entire number. As the expenditure of the Department during 1893 amounted to 666,308*l.* it can hardly be said that the success, such as it was, was attained on economical terms.

ENGLISH ECCLESIOLOGY.*

IF all the subjects relating to churches and ecclesiastical buildings were prohibited from forming part of archæology, that branch of knowledge would become exceedingly circumscribed in this country at least. It was fortunate, therefore, that vandalism and other species of reform were less thorough in action than in theory. The buildings have become invaluable as evidence and as the subjects for countless controversies. Moreover the clergy, from having charge of old churches, were induced to study archæology, and for many a year they helped to foster it. For those reasons ecclesiology has claims on the attention of archæologists who devote themselves to pagan and secular subjects.

At the present time, neither ecclesiology nor archæology can be considered as popular subjects. But in the early part of the century, and in the eighteenth century also, still less attention was given to it. When "SYLVANUS

* *The Gentleman's Magazine Library: Ecclesiology.* Edited by F. A. Milne, M.A. London: Elliot Stock.

URBAN" hospitably received communications about old churches and other survivals of antiquity, he was therefore doing as benevolent work as if he founded a foundling hospital or a refuge for castaways. He helped to keep archæology alive. At first the waifs and strays that arrived at St. John's Gate were not of much account, but as years rolled on shelter was sought by a superior class. Mr. GOMME has exhibited a great many of them, and those which belong to ecclesiology are at least as interesting.

The contents of the book are arranged in three divisions, viz. Early Church Building, Church Interiors, and Church History. The first part is made up of correspondence about Lyminge Church, the question at issue being whether the existing building dates from the seventh century or from the eleventh. Mr. R. C. JENKINS upheld the former theory, while Mr. J. H. PARKER, who was disposed to be sceptical about very ancient buildings, took the other side. The problem turned on the date when churches of masonry superseded timber buildings. It is believed that a monastery was founded at Lyminge in the eleventh century, and the foundress, St. ETHELBURGA, was buried "in the north-east porch (in aquilonali porticu) of the church against the south wall, covered with an arch." Mr. PARKER considered that instead of north-east porch we should say "the north aisle," as porticus was often used in that sense by Mediæval writers. He also concluded that the present church was built of fragments of an earlier church of Roman origin. Mr. JENKINS agreed about the use of materials from an earlier church in the building, but he would not yield about the accuracy of his translation of portico into porch. According to him "porticus," in the writings of the seventh and eighth centuries, never means aisle, but always porch. When the porches of the older churches were covered and formed into aisles, carried along the original external wall, then the word became equivalent to aisle. In BEDE the word always means porch; and ISIDORE of Seville, the highest authority on the meaning of such words in 600-800, gives only the ancient meaning. In fact, it was by the ancient councils (especially of Nantes) made unlawful to bury in churches, the porch and the outer walk being alone permitted for the purposes of burial. Mr. PARKER, in reply, was able to cite many cases in which the Latin word suggests aisles rather than porches. One was from ALCUIN's description of a church in York, which was written about 780. One line, "Pulchraque porticibus fulget circumdata multis," was considered by Professor WILLIS to refer to many aisles or apsidal chapels. He also quoted passages from which the space where bodies were interred was supposed to be within the church, and must therefore mean an aisle, transept or chapel. Mr. PARKER took the opportunity to express his conviction "that the churches of the tenth century were so generally of wood only, that very strong evidence is necessary to show that a particular church of stone is of that period." Mr. JENKINS was, of course, able to furnish passages which were no less confirmatory of the identity of porticus and portico. On the more important subject of materials he referred to documentary evidence of the erection of churches of stone in Belgium, Rome, Normandy, Cambrai, Augsburg and England. Mr. PARKER, in his reply, argued that the documents supported his views. As regards Rome, where masonry might be supposed to be always in demand, he said:—"If Mr. JENKINS will arrange to make an excursion to Rome with me, I will engage to convince him by the evidence of his own senses that all the early Christian churches in Rome, from the fourth century to the twelfth inclusive, are built of brick. The brickwork is more or less hidden or disguised, but the real structure is of brick, and the marble columns are for the most part antiques." Various archæologists took part in the contest, and their opinions are of much interest. But after all it cannot be said that the communications made it any clearer whether the Mediæval porticus was within or without a church, and whether in the tenth century there were enough masons in England who were competent to erect a church.

The second part of the volume is more diversified. There are essays by WILLIAM BURGESS on "Mediæval Mosaics," and by ALBERT WAY on "Pavements of Figured Tiles." But the majority of the contributions are anonymous. Among the subjects treated are church towers and bells, chantries, confessionals, mural paintings, rood-lofts,

stained-glass, tabernacles, sculpture, &c. In the third part, relating to church history, is an essay by Mr. C. A. BUCKLER on the churches of the Dominicans, besides others on cathedrals prior to the civil wars, cathedral schools, documentary history of English cathedrals, the bishop's palace and ecclesiastical buildings of Wells. All of them merited reprinting, and it is to be hoped the present will not be the only volume devoted to ecclesiology in the series. It would be an advantage in the next collection if the woodcuts which accompanied the articles were reproduced. The absence of them diminishes the value of Mr. BURGESS's mosaics, the essay on church bells, &c., where reference is made to figures, and which are therefore necessary to make the text clear.

THE SCHACK GALLERY, MUNICH.

SINCE the days of its first art-king, Ludwig of Bavaria, says a correspondent of the *Scotsman*, Munich has been the art city of Germany. At the present time there is something almost pathetic in its distrust of all innovations prompted by the utilitarian spirit, and its determination that every one entering its gates shall bow the knee before the shrine of the æsthetic. Berlin, and Dresden, and Leipzig may engage in a series of demonstrations on "municipal housekeeping," and devote themselves with fanatic enthusiasm to the details of street cleaning and street architecture. Munich remains unswept and ungarnished. The public offices are sacrificed to the museums of sculpture and painting. A due regard to the health and convenience of the community is held as the badge of a most reprehensible Philistinism. In Munich art is king, and the artist is the aristocrat. He is the only man to whom public opinion accords the dignity of a silk hat. He is the only man, with the exception of the hotel-keeper, who makes any money. In Munich Lenbach is a mightier man than Bismarck, whose portrait he paints, and the Lenbach villa is almost as princely, and in very much better repair than the palace of the Bavarian kings.

Within the last few weeks Munich has passed through a crisis. It has been in danger of losing a possession of which for many years it has been deservedly proud—the small but very valuable collection of pictures belonging to the late Count Schack. The Schack Gallery has been for more than twenty years one of the sights of Munich, a "place of interest" that the conscientious tourist finds himself quite unable to ignore, since it stands in "Baedeker" marked with an asterisk, sharing that proud distinction with the National Museum, the Glyptothek and the two Pinakotheks. It is in part owing to the honour thus conferred upon it that not a few of the visitors to Count Schack's collection leave it with a certain sense of disappointment. In most cases they have come there straight from the Old Pinakothek, from the Rubens Gallery, where Rubens is to be seen in greater perfection than in his own Antwerp; from masterpieces of Vandyke, or Rembrandt, or the great Italians; from Murillos, whose rivals are scarcely to be found in all the galleries of Spain; and, in comparison with these, the little private collection, with its copies from the old masters and its hundred or so of pictures by contemporary German artists sinks into insignificance.

Yet the Schack Gallery fills a unique place in the history of modern art. It marks the turning-point when, after centuries of sterility, Germany once more proved herself capable of producing an artist who should rank with the great masters. The Schack Gallery contains, besides much that is of less value, pictures by the well-known artists Lenbach and Feuerbach—above all, a number of the earlier works of Germany's great idealist painter, Arnold Böcklin. The significance of the gallery lies in its possession of these pictures. The treasures of the Pinakothek bear record only to a great past, for the most part to the past of other nations, the presence of the great masterpieces of Holland and Italy in the Munich and Dresden galleries having indeed hindered the growth of an independent school of painting. Feuerbach, Lenbach, Böcklin were the first among the modern Germans to act on the principle that imitation, however excellent, is not the end and aim of art.

So far back as the fifties Count Schack recognised their merit, admiring in their work a quite new quality of strenuous earnestness in depicting what they themselves saw, a determination, in face of all criticism, to stand or fall in their own strength or weakness. He bought their pictures and opened his galleries to the public, and to his patronage it is largely due that Munich is at the present time the seat of a school of painting which has already made its mark outside Germany, which every year contributes notable pictures to the Paris exhibitions, which deserves least of all to be ignored by Scotland, since it has during the last five years extended a generous patronage to the artists of the Glasgow school.

When it became known, on the death of Count Schack some weeks ago in Rome, that he had bequeathed his gallery, not in accordance with the general expectation to the city of Munich, but to the Emperor William, and that the pictures would in all probability be removed to Berlin on the earliest opportunity, something like a panic arose. A Munich without its Schack Gallery was to its citizens almost as inconceivable as a Munich without its Pinakothek. That their loss was to be the gain of Berlin, which has quite lately been presumptuous enough to set up an art school of its own, was a prospect that it was impossible to regard with equanimity. But the Emperor has been generous. Greatly as he must have coveted Count Schack's collection for a city which it is his cherished object to make the capital of the empire in every sense of the word, he has left Munich in possession of its treasure. He has done more. He has bought from Count Schack's brother the house in which the collection has grown together, and taken steps to insure that the pictures shall remain permanently within its walls. The concession he has made is a great one. He has practically given Munich a new lease of life, with his pledge that it shall have his recognition as the art city of the empire.

The unique attraction of the Schack Gallery consists, as has been said, in the dozen or so of pictures painted by Arnold Böcklin, the one great master that Germany has produced in modern times—the greatest German painter, perhaps, since Albrecht Dürer brought his art to its early perfection in Mediæval Nürnberg. Böcklin stands alone among his contemporaries. He has studied in every school, but no school can claim him as its own. He was born in Basel, he studied in Brussels and Antwerp, in Dresden and Geneva. He was in Paris during the bloody July days of 1848, earning there a bare subsistence by illustrating surgical cases for the doctors attending the wounded. He has lived sometimes in Weimar, sometimes in Zurich, often in Munich, lured there by its art treasures, oftener still in Rome or Florence, or at San Terenzo, on the Gulf of Spezia. He has not lived in a groove, and he has not painted in a groove. Other artists have constituted themselves specialists, made themselves interpreters of nature in one or another phase, delighting above all in the reiteration of some favourite theme. Böcklin's subjects are almost as numerous as his canvases. The commonplace and the heroic, the desert and the village, tragedy, comedy, myth, fairy-tale, farce—he is inexhaustible as nature herself. Scarcely ever does he repeat himself. Men, women, witches, satyrs, fauns, dragons and sea-serpents, combinations of men and animals more marvellous than the old mythologies ever dreamed of, live in his pictures. Böcklin is painter, he is also poet and philosopher. Imbued with the spirit of classical antiquity, he is at the same time the most modern of the moderns. His tritons and naiads, his centaurs and fauns, his Pans and satyrs are no mere imitations of the bronze and marble treasures of museums, of gypsum reliefs and marble torsos. They are new creations, full of the poetry of the old world, yet in perfect harmony with the laws of organic formation as taught by the science of the nineteenth century. Without their superstition Böcklin has the feelings of the old Greeks for nature. For him every waterfall has its nymph. For him, as for Homer, the flash of lightning is a fiery bird, the clouds are the flocks of heaven. There have been in the past classical revivals enough, Dürers and Mantegnas, Canovas and Thorwaldsens, to bring to light the fossilised remains of a dead world—a world that Böcklin now reveals to us for the first time, fantastic and poetic, glowing with passion and colour like our own. His *Pan* of the Schack Gallery, whose demoniac laughter sends a shepherd and his goats flying terrified over rocks scorching in the mid-day heat, is the very Pan of Greek myth, the picture is the perfect expression of "panic fear." His dragon, stretching its scaly hideous neck down from a chasm in the rocks towards three travellers clinging together in an agony of fear is a monster with all the sinuous horror of the dragons of old times. Yet its prototype is to be found in the realms neither of natural history nor mythology. There is a singular appropriateness between these pictures and the studio where they were transmitted to the canvas, a studio as unlike all other studios as Böcklin is unlike all other artists—a long bare room, empty of the usual paraphernalia of easels and bits of drapery, and finished and half-finished canvases, the walls hung with black, with here and there a strip of brilliant colour that produces an almost weird effect on the mysterious dusky background.

Besides imagination and a striking originality, Böcklin has one other gift that has always been characteristic of the great poets—an artistic unity, a "unity of feeling," as Coleridge calls it—which he, as a critic, has found rendered in its highest perfection in Shakespeare. "Read 'Romeo and Juliet,'" he says. "All is youth and spring—youth with its follies, its virtues, its precipitancies; spring with its odours, its flowers, its transiency. It is one and the same feeling that begins, goes through and ends the play." So it is everywhere in Shakespeare—in "Lear," in "The Tempest," in "The Winter's Tale"—and in so far as the scope of his art permits, so it is also with Böcklin. He

paints Odysseus on the sea-shore, and the grey landscape, with its limitless horizon, is in perfect accord with the mood of the wanderer looking out sadly towards his far-off home. Psyche is crowned by Eros in an atmosphere of sunny radiance. The meadows are gay with flowers and butterflies; the sea reflects a perfectly unclouded sky. Prometheus lies fettered to the rocks, a dim, lonely figure in the wilderness of the great Caucasus, struggling to break the chains that bind him there. And all nature struggles with him. Heavy masses of cloud are driven across the sky, ghostly lightnings flash, the wind spends itself in blind fury on the mountain sides. The *Prometheus* is one of Böcklin's later pictures, and was exhibited in the Munich exhibition in 1893; but the same artistic unity characterises his earlier canvases in the Schack Gallery. In *The Anchorite* a hermit, an old man, half naked, kneels before a rough cross on a steep mountain side. Ravens fly above his head. A bit of blue sky that seems to belong to some other world is seen between the gnarled and twisted branches of the trees. The scenery is wild and stern, and the spirit of the man chastising himself before the cross is stern and pitiless as the rocks. Another picture in the Schack Gallery is entitled *The Ride of Death*. Death is riding a black horse through the forest on a wild autumn night. Around are great trees, many of them shattered by previous storms. The horse starts at a blinding flash. In the momentary light showers of yellow autumn leaves are seen falling to the ground. In its mingling of grandeur and desolation Böcklin's rendering of *Death* has hardly been surpassed.

Böcklin is a colourist of rare power and originality. Boldly, with an absolute recognition of their value, he has from the first made use of the clear, pure prismatic colours that other artists banished from their canvases as crimes against the æsthetic. The wonderful brilliancy and pellucid clearness of the water in his mermaid pictures, and the play of light upon the strange forms, half-fish, half-maiden, that frolic in its depths, seem indeed to have been transferred to the canvas by some sort of magic. Like Leonardo da Vinci, and with more uniform success than Leonardo da Vinci, Böcklin has made innumerable experiments in the methods of his art. He has worked in tempera, fresco and water-colours as well as in oils, and his stone masks of fauna and satyrs in the Basel Museum are characterised by the power and individuality that belongs to everything his hand has touched. The question as to the durability of his pictures is with him an all-important one. He rubs the colours himself, testing the pigments with chemicals, preparing the canvas with his own hand. The pictures of the Schack Gallery illustrate the value of this attention to detail. Although in some cases more than thirty years old, they look as fresh as though they had just left the easel.

Böcklin has been compared with Burne-Jones, with Rossetti and the French idealists. It will be seen that his range is wider than theirs. In one respect especially he differs from them. All of them have something (some of them not a little) of the morbid sentimentality, the despairing psycho-pathetic tendency of the age. Böcklin alone among the modern idealists possesses the unmodern characteristic of iron health. No better illustration of it could be found than the picture in which he has portrayed himself, like Rembrandt, holding in his hand a glass of wine, plainly in the best of humours with himself and all the world. Everywhere he is absolutely free from sentimentality, full of sanity and sunny cheerfulness, and that old Olympian jollity that seems for the most part to have passed out of the world.

The Schack collection is not rich in portraits. It possesses two, however, which would attract attention even on the most cursory visit. These are the portraits of Count Schack himself, painted by Lenbach. Both are characteristic of the man, who, as the generous and discriminating patron of art, has a wider than European fame, but neither of them pictures him as he was in his old age. He was an old man when he died a few weeks ago in Rome, as for the most part he had lived there during the last years of his life. For some time he had been quite blind, and more and more rarely of late had been able to undertake the journey to and from Munich. When he was there he spent much of his time among his pictures—a grey-haired, noble-looking old man, lingering thoughtfully before one or another of them, as though his physical nearness to them brought back more vividly the remembrance of the beauty of form or glow of colour that had first delighted his artistic sense. It is in connection with his gallery of paintings that Count Schack will be remembered; but it was not as the collector of pictures that he wished to be remembered. With the same curious twist of judgment that made Addison place his poems above the papers in the *Spectator*, that made Hogarth boastful of himself as a "history painter," he had set his heart on literary fame. In a great measure it was denied him, and the want of it left him a little bitter. In his youth he had travelled widely. He had been the friend and biographer of Mazzini, and had known almost all the remarkable men of his time. Wealth and social position enabled him to develop his artistic taste to the utmost. He went from country to country, the guest, as it seemed, of all

times and all peoples, an unconfessed epicurean, his aim self-culture, his delight the description and exposition of the things he had seen in his wanderings.

His lyrics, his "Nights of the Orient," his hymns to civilisation could only have been written by a citizen of the world. His wide culture was the thing most characteristic of him—that and an insatiable appetite for work, that grew at the last to be almost a fanaticism. All his life he was an indefatigable worker. He had written epics and dramas and art histories—histories, amongst others, of "Dramatic Art and Literature in Spain," of "The Poetry and Art of the Arabs in Spain and Sicily." During the last winter of his life he composed poems and sonnets, and translated several Spanish dramas. He died pen in hand, with an unfinished poem on his lips. But work as he would, fame always eluded his grasp. His art had its limitations. Always interesting and powerful when he speaks in his own person, he is invariably weak and colourless when he makes himself the mouthpiece of other individualities. His romances in verse, in which, taking "Don Juan" as his pattern, he himself is the hero, and where no attempt is made to rise above the subjective, are perfect works of art, sparkling everywhere with brilliant satire and graceful flights of fancy. His epics and dramas have scarcely any other charm than that which belongs to a beautiful thought expressed in blameless outward form. As a translator he is at his best; a master of many languages and of their metrical forms, his most valuable contributions to literature are his translations from Spanish and the Oriental languages.

Now, after Count Schack's death, it is pathetic to think of the deep, almost tragic, longing for recognition that possessed him—of his almost childish pleasure when chance, or a letter from some student or lover of art, brought him the knowledge that some one had found pleasure in what he had written, and of his strange unwillingness to accept, as the patron of art and the collector of the "Schack Gallery," the fame which was so justly his due.

ARCHITECTS' FEES IN SYDNEY.

THE following case recently occupied the chief justice, Sir Frederick Darley, and a jury of four, in the Supreme Court of New South Wales. The action was brought by William Pritchard and Arthur Frederick Pritchard, trading as Wm. Pritchard & Son, architects, against Frederick E. Winchcombe, E. J. Turton, C. L. Wallis and Duncan Carson, trading as Winchcombe, Carson & Co., woolbrokers, to recover the sum of 640*l.* 9*s.*, claimed to be due to the plaintiffs as commission, &c., for work done for the defendants in preparing plans for wool stores. The defendants paid into court the sum of 168*l.* 6*s.* 3*d.* as sufficient to satisfy the plaintiffs' claim, and with their pleas set out particulars showing payments to plaintiffs from July to December, 1893, to the total amount of 370*l.* 9*s.*

The plaintiffs' case was that in January, 1893, William Pritchard, the senior member of the plaintiffs' firm, had an interview with Mr. Winchcombe, who informed him that his firm contemplated erecting a large wool warehouse, and that having known Mr. Pritchard previously in connection with the erection of Goldsbrough, Mort & Co.'s stores at Darling Harbour and Circular Quay and other large buildings, he wished him to look out for a suitable site for the purpose. Plaintiffs accordingly made the necessary inquiries and defendants, first of all, selected a site at Pyrmont upon which they thought of erecting a building four storeys high. Plaintiffs prepared plans and drawings for this building, but the idea was abandoned, and plaintiffs subsequently inspected some land at Wattle Street, Ultimo, and reported to defendants, who decided to erect the building upon that site. The defendants made fresh plans and drawings, and after some delay the defendants determined for the present to erect only the central portion of the stores, leaving the wings to be added afterwards. The central building was completed on the plans furnished by plaintiffs, and "fish-plates" and "toothing" were left, so that the wings could be solidly dovetailed to the main structure when the additional work was determined upon. This was about November or December, 1893, and in January of the present year the plaintiffs, having noticed that defendants had advertised for prize designs for additions to their wool stores at Wattle Street, wrote to the defendants with reference to the matter, stating among other things, "We were certainly very much surprised at this, not having received the slightest intimation from you either that you were dissatisfied with our carrying out of the centre portion of our approved design, or of your intention to abandon the design already prepared by us and approved of by yourselves and by the City Council, and copies of which were and are still deposited in the city surveyor's office as guarantee of your intention to complete the building according to that design. On this understanding you were allowed in the meantime to enclose the centre por-

tion, which you wished first to erect, with temporary side walls of galvanised iron." In reply to this letter the defendants wrote:—"You are under a peculiar misapprehension regarding our building. We never approved or even asked for any plans from you other than those of the building which you carried out. There is no occasion for you to interview Mr. Winchcombe unless it is as probable submitters of a competitive design for our further building." The plaintiffs subsequently instituted the present action, the principal items of the claim being as follow:—"Receiving instructions to make estimate for a building on portion of lands for sale by Peyton, Dowling & Co., in Pyrmont Street, Pyrmont; taking levels, making sketch plans and detailed estimate for a building, 264 feet long by 115 feet wide, four floors in height, estimated cost 22,576*l.*, with estimated cost of additional storey 3,000*l.*, and hydraulic lifts 250*l.*; total, about 26,000*l.*—1 per cent. on estimate, 260*l.*; to receiving instructions to prepare plans for building, 400 feet by 300 feet, on land, Wattle Street, Ultimo, with estimate of same; inspecting site, taking levels, preparing plans, elevations and sections; and estimate of the said work, 20,000*l.*—1½ per cent., 300*l.*"

The plaintiffs' case having closed, the defendant, F. E. Winchcombe, gave evidence that he never gave the plaintiff, W. Pritchard, any instructions to look out for a suitable site for a store. He was continually calling and asking witness when the firm were going to build a store, and upon one occasion Pritchard submitted a memorandum containing the descriptions of a number of blocks of land, and he specially mentioned Peyton Dowling's land at Pyrmont Street, Pyrmont. Being a little bit impatient with his persistence in the matter, witness asked him what it would cost to put a building of four storeys on the land, expecting to get a reply there and then. Pritchard said he would let him know, and witness told him to give him a rough idea; but he gave no instructions to make estimates or to go out to the land and take levels. Indeed he did not know that levels would be required, and when he asked Pritchard to give him a rough idea of the cost he did so in order to choke him off, as he was so persistent in the matter. Next morning he called with the estimate, and witness told him it was out of the question. He never told Pritchard, as he had stated, the matter was one of urgency, so that they might be in time for the wool season, and he did not give him instructions to prepare plans of a building or to do any of the work charged for under the claim of 260*l.* When witness secured the land at Wattle Street, Ultimo, he stated the fact to Pritchard, who shortly afterwards brought him a sketch-plan embodying the ideas witness had conveyed to Pritchard in the course of various conversations. When he saw the plan he was pleased with it, and asked Pritchard to leave it. Pritchard said that a building like that would cost about 20,000*l.* Subsequently he called upon Pritchard formally with reference to the matter, and told him that he intended to build on 100 feet of the land, which had a frontage of 400 feet. Pritchard was instructed to prepare plans of a building covering 100 feet of the land, and so designed that wings could, if necessary, be added at some future time; but he never told Pritchard at any time to prepare plans of a complete building at a cost of 20,000*l.* The lease of the stores which defendants occupied would not be up for two years, and he told plaintiff it was not probable that the firm would complete the whole building for some years. When plaintiff sent in his estimate and plans for the central building, the amount stated was 8,935*l.*, and as defendant did not contemplate then going into a larger expenditure than 6,000*l.*, he went through the plans with plaintiff and made certain alterations, which reduced the amount. The wing to the building which the defendants were now proceeding with was not based upon plaintiff's design at all, and witness had not seen plaintiff's plans of the wings since they were first shown to him.

Counsel having addressed the court, his honour summed up, and the jury, after two hours' deliberation, intimated that they were prepared to give a verdict by majority. This was accepted by the parties, and was in favour of the plaintiff in the sum of 50*l.* above the amount paid into court.

The *Australasian Builder*, in commenting on the case, says:—"The result of the action, Pritchard and Another *v.* Whitcombe and Others, can scarcely be regarded as satisfactory. The circumstances connected with the affair, as given by Mr. William Pritchard, are so simple and straightforward that it is difficult to imagine any reasonable person coming to any other conclusion than that the right to the claim was fully made out. We, of course, look at the question from a professional point of view, but it is an unfortunate fact that, not only in the colonies but in Great Britain, both judges and juries have generally shown a tendency to regard an architect as, *prima facie*, a rogue. The late Lord Chief Justice of England, Lord Coleridge, on several occasions gave rulings which clearly showed his prejudice against the profession, and in the Sydney case now under review, Sir Frederick Darley, in his summing-up, exhibited something of the same tendency. The one consola-

tion we experience in regard to the verdict is that it will serve in some degree to show that clients cannot be allowed to throw over an architect just as it pleases them—an idea which seems to be very prevalent in these days.

TESSERÆ.

Decay in Cement.

THE primary cause of the premature decay which takes place in stuccoes and cements when used externally as a coating to walls is the presence of muddy earth and decayed animal and vegetable matter in the sand used with the lime and cement. To this may be added frequent impurities in the limes and cements themselves, particularly of argillaceous matter in the former, and sometimes to the too great proportions of lime or cement to sand. These things might, however, remain quiescent for a long time if the work were well protected from access of moisture, which is the grand exciting cause. The paint or distemper wash on the surface is generally sufficient to prevent the rain which may beat against a vertical face from penetrating, especially if the work have been well hand-floated and trowelled, to make it close and compact; but the evil arises from exposure above, and from the numberless horizontal unfloated surfaces which are constantly presented. These receive and collect the water, and convey in streams over the vertical surfaces what is not immediately absorbed, and the work thus becoming saturated, frost seizes and bursts it, or warmth calls the vegetative powers of the impurities in it into action, and the whole is covered with a green sward. Let the sand of which a plaster composition is to be formed, whether with lime or cement, be washed until it no longer discolours clean water, and be well compounded with cementitious matter free from the impurities with which it is so frequently charged; let the work be well hand-floated and trowelled, particularly on the backs or upper horizontal surfaces of projections, and protected above by projecting eaves or otherwise, and the work, with common care and attention to paint or distemper at intervals, will last as long as anything of the kind can be expected or is found to last anywhere.

The Picturesque in Greece.

Though the absence of picturesque descriptions of landscape forms a characteristic feature of Greek literature in its better periods, still there are in almost all writers either detailed passages or at least epithets and allusions from which the prevailing taste may be partially gathered. Now one of the first things that strikes us in all such is the utilitarian character of the Greek notions of scenery. From Homer to Theocritus may be traced the same principle lying at the bottom of their expressions in reference to nature, that only those objects are agreeable, and therefore by association beautiful, which minister directly to man's comfort or sensual enjoyment; objects which stand in his way and bring discomfort, inconvenience or danger are ugly and dreadful. Thus the shady or fruitful tree, the cool water, the fertile plain, the calm sea on which "go the ships," the clear bright sky, whether by day or night, are delightful and lovely; the rain, the thunder-cloud, the tempest, the precipice, the torrent, the glacier, suggest no emotions but alarm or horror. The Greeks were an eminently practical and also a highly sensual people, and both these tendencies contributed to this peculiarity of taste or want of it, as we are accustomed to say. They could see no reason for admiring a rock which was rough and hard to climb, and interposed an obstacle to the journey between Megara and Corinth, or in the lightning which blasted the oak, or in the stormy sea which engulfed their corn ships or triremes; they liked to see before them deep crops and rich pastures, vines, figs and olives; the stream whose gentle murmur invited to repose, and the grassy bank and plane tree, with its thick shade and fragrant flowers, which seconded the invitation—objects which either regaled their senses or suggested images of affluence and enjoyment. And as they were totally devoid of cant, affectation and sentimentalism, what they really loved they talked and wrote about, and never dreamed that they were under any obligation to express admiration and enthusiasm which they did not feel, merely in compliance with the prevailing fashion of the day.

The Fine Arts and Utility.

The great use of the arts is to humanise and refine, to purify enjoyment, and, when duly appreciated, to connect the perception of physical beauty with that of moral excellence, but it will at once be seen that this idea of usefulness is in a great measure distinct from the ordinary meaning of the term as applicable to the productions of human ingenuity. A positive use results, indeed, directly from the cultivation of the formative arts, precisely in proportion as their highest powers are developed, for it will be found that at all times when the

grandest style of design has been practised with success, and particularly when the human figure has been duly studied, the taste thus acquired from the source of the beautiful has gradually influenced all kinds of manufactures. Again, as illustrating science, the fine arts may be directly useful in the stricter sense, but this is not the application which best displays their nature and value. The essence of the fine arts, in short, begins where utility in its narrower acceptation ends. The abstract character of ornament is to be useless. That this principle exists in nature we immediately feel in calling to mind the merely beautiful appearances of the visible world, and particularly the colours of flowers. In every case in nature, where fitness or utility can be traced, the characteristic quality or relative beauty of the object is found to be identified with that fitness—a union imitated as far as possible in the less decorative parts of architecture, furniture, &c., but where no utility save that of conveying delight (perhaps the highest of all) exists, we recognise the principle of absolute beauty. The fine arts in general may be considered the human reproduction of this principle. The question of their utility therefore resolves itself into the inquiry as to the intention of the beauties of nature. The agreeable facts of the external world have not only the general effect of adding a charm to existence, but they appeal to those susceptibilities which are peculiarly human, and it becomes necessary to separate the instinctive feelings which we possess in common with the rest of the creation from that undefinable union of sensibility and reflection which constitutes taste, and which, while it enlists the imagination as the auxiliary of beauty, is in its highest influence less allied to love than admiration. It is this last feeling which the noblest efforts of the arts aspire to kindle, which not only elevates the beautiful, but reduces ideas of fear and danger to the lofty sentiment of the sublime, which, as its objects become worthier, is the link between matter and mind, and which tends to ennoble sympathy and increase self-respect.

Arts Among the Aztecs.

The Aztecs had made some progress in the arts of social life. The monuments of architecture, sculpture and painting which still exist, though very far behind that degree of perfection which these arts had obtained among some of the nations of the old continent, are not devoid of merit. The Aztec painters had no knowledge of perspective nor of light and shade. Their designs are coarse and uncouth; their figures are fantastical and only drawn in profile; but they are remarkable for the brilliancy and durability of their colours. In these paintings the lands of the king were painted red, those of the nobility scarlet and those of the people light yellow. Their works of architecture and sculpture evince a far superior degree of excellence. The Aztecs were also acquainted with the art of casting in metal figures of natural objects. Their mosaic, or rather works of embroidery, were admirable. The method they adopted was to glue feathers of different colours upon a piece of canvas, and then place it upon a tablet of wood or a plate of copper. They laid the feathers so even and matched the colours so admirably as to give to objects thus represented the appearance of painting. Another work, which might with greater propriety be called mosaic, they made with pieces of shells of different colours. This work was done by separate artificers, every one of whom undertook a certain part of it, and then another artist arranged the different parts together, so as to complete the performance. The houses of the poor were made of reeds or of unbaked brick, and were roofed with a certain species of grass, upon which they placed leaves of the aloe cut in the shape of tiles. They had but one apartment, where all lived together. The houses of the citizens had besides an *ajauhcalli*, or oratory, and a *temazcalli*, or bath. The nobles had their houses built with stone and mortar, and consisted of two storeys, covered with a flat roof or terrace. The stone most commonly used for building was the *tetzontli*, a red stone, very hard and porous.

Early Norman Castles.

Our Saxon ancestors reared few places of strength. Their habits were peaceful and agricultural rather than warlike, and they lived, as William of Malmesbury informs us, in low and mean houses, having no pretensions either to splendour or strength. This defenceless condition of the island rendered it so easy a prey to the Norman conqueror. And it was to remedy this defect and secure his newly-acquired dominions, as well against invasions from without as rebellions within, that William lost no time in erecting strong castles in all the principal towns of his kingdom, as at Lincoln, Norwich, Rochester, &c., for the double purpose, as we are told by Stow, "of strengthening the towns and keeping the citizens in awe." His followers, among whom he had parcelled out the lands of the English, had likewise to protect themselves against the resentment of those they had despoiled, and imitated their master's example by building castles on their estates. The turbulent and unsettled state of the kingdom during the succeeding reigns caused the rapid multiplication of these strongholds, until, in

the latter end of the reign of Stephen, there are said to have been no fewer than 1,115 castles completed in England alone. "The whole kingdom," says the author of the Saxon Chronicle, "was covered with them, and the poor people worn out with the forced labour of their erection." It was soon found also that they were likely to be no less inconvenient to the sovereign, enabling a cabal of barons to beard the power of their liege lord; and one of the first acts of Henry II. was to prohibit the erection of any castles without a license. Some of these are extant. The oldest known is that granted by Richard II. to Richard Lord Scrope, his chancellor, for the building of Bolton Castle. It is styled in the document "*Licentia batellare, kernellare (crenellare), et machicolare.*" Many of the castles of this age were of great size, and possessed a certain rude grandeur of design. To the single keep-tower of earlier date several other towers, both round and square, were added, united by flanking walls, so as to enclose a polygonal courtyard, the entrance to which was usually between two strong contiguous towers. An outwork, called the barbican, often still further defended the approach, as well as a moat and draw-bridge. Plates of iron covered the massive doors, in front of which the grated portcullis was let down through deep grooves in the stonework; and overhead projected a parapet resting on corbels, between which were the openings called machicolations, from which melted lead, hot water and stones could be thrown on the heads of the assailants who should attempt an entrance by forcing, or, as was the usual mode of attack, firing the doors. The gateways of Caerlaverock, Tunbridge, Conway, Carisbrook and Carnarvon are good specimens of this kind. The keep-tower or stronghold rose pre-eminent above the rest, and generally from an artificial mount. It contained the well, without which the garrison would not have been enabled to hold out in this their last place of refuge; the donjon or subterranean prison, the name of which was often extended to the whole keep; and several storeys of apartments which were probably not occupied by any but retainers, except during a time of siege. The staircase which communicated with these storeys was either pierced in the thickness of the walls or built on the outside of the tower.

Elizabethan Mansions.

When the intercourse between the different states of Europe had become considerable the fame of the Italian architects was a subject of deep interest in this country, where the rage for building was no less strong and general than in Italy. In the brilliant reign of Elizabeth the English nobles and princely proprietors vied more than ever with each other in the magnificence of their mansions. It might have been supposed that the noble Tudor houses, with their panelled walls, buttresses and battlements, traceried windows, sculptured dripstones, florid pinnacles and embossed chimney-shafts, were sufficiently rich and gorgeous to satisfy the prevailing taste for splendour; but in their anxiety to strike and surprise the admiration of their countrymen many deserted the native styles and sought for designs and even artists from abroad. Italian architecture became by degrees the mode, and even where the indigenous style was adhered to in the general design, many of the enrichments and ornamental features were borrowed from the Italian. First of all the porch or gateway, as the most conspicuous points on which to exhibit these exotic novelties, were decorated on either side the entrance, and perhaps a second and third storey above with pilasters, belonging to the different Greek orders; the doorway itself exchanged the low Pointed or Tudor for the circular arch—the deep, elegant and sweeping Gothic mouldings for the Vitruvian architrave, cut across by the awkward projecting imposts. The porch of Milton Abbey, built in the reign of Henry VIII., is one of the earliest examples of this innovation. Lower Marney Hall, in Essex, built in the same reign, is another. In plan it is a regular embattled quadrangular mansion, built entirely of brick. The gate-tower is flanked by large and lofty octagonal turrets with narrow pointed windows, but topped with lotus-leaf ornaments and scrolls instead of battlements, while the mullions of the large windows terminate above in debased Ionic capitals; all these enrichments are moulded in brick. Next was introduced the cupola whose invention in Italy had made so much noise that it appears our country squires were anxious to have miniature specimens of it at home. It was applied as a covering to the high turrets, round, square or polygonal, which flanked the entrance or terminated the angles of the building, and surmounted with gilded vanes certainly produced a rich and imposing effect, as we experience in Burleigh and Cobham. The parapet over the porch and the projecting windows was at the same time exchanged for the pediment, and busts of the twelve Cæsars and similar devices took the place of the ancient heraldic animals and shields. Then followed the removal of the panelled battlements and the substitution of a parapet carved into fantastic notches or scrolls, or perforated with oval openings and ornamented with obelisks, balls, busts, statues and other singular decorations.

These ran up the gables, which were often twisted into strange shapes, and sometimes wholly replaced by the level balustrade. And thus the most characteristic features of the old style, its numerous steep gables and spiry pinnacles, were succeeded by the uniform horizontal straight lines of the new. At length the whole building was surrounded by columns or pilasters, rising tier above tier to the exhaustion sometimes of the four orders—open arcades took the place of the entrance porch—and nothing remained of the Tudor style but the mullioned window, which, however, was of itself sufficient to give a peculiarly picturesque and old-fashioned aspect to the whole building.

The Bezant in England.

Camden, noticing the coined and other money in use among the Saxons, says:—"Gold they had also, which was not of their own coin, but outlandish, which they called in Latin Bizantini, as coined at Constantinople, sometimes called Bizantium, and not at Besançon in Burgundy. This coin is not now known, but Dunstan, Archbishop of Canterbury (as it is in the authentic deed), purchased Hendon in Middlesex of King Edgar to Westminster for two hundred Bizantines. Of what value they were was utterly forgotten in the time of King Edward III.; for whereas the Bishop of Norwich was condemned to pay a Bizantine of gold to the abbot of St. Edmundsbury for encroaching upon his liberty (as it was enacted by Parliament in the time of the Conqueror), no man then living could tell how much that was, so as it was referred to the king to rate how much he should pay." In Domesday Book no mention whatever occurs of the Bezant; but it occurs twice as a denomination of money in the Winton Domesday of the year 1148, and several times in the Boldon Book, a survey of the palatinate of Durham made in 1183, both printed among the Supplementary Records to the Great Domesday. The monks of Oseney, in consideration of the manor of Hampton-Gay in Oxfordshire, in the 6th of King Stephen, gave ten marks of silver to Robert de Gait, and one bezantine to his wife. Madox says that in Henry II.'s time Cressalin, the Jew of Winchester, was amerced one hundred marks, and he paid, instead thereof, one hundred bezants, which were accepted by the king, *mera gratia*. Madox also says that in the 17th year of King John, 10s. of Venetian money and two bezants were used at the Exchequer for counters, the Venetian shillings valued at 15s. and the two bezants at 3s. 6d. There of course were silver bezants. From the narrative of William de Braose's treasons (recorded in the Black and Red Book of the Exchequer) against King John, it is clear that silver bezants were in use in that reign; for when Maud, Braose's wife, was to make the first payment of a fine of 40,000 marks, which she and her husband had consented to pay on being restored to the king's favour, she told the justiciary and the rest who were sent to distrain upon their goods that they must expect nothing, she having no more money in her purse than twenty-four marks silver, twenty-four shillings of bezants, and fifteen ounces of gold. John of Glaston in his "Chronicle" informs us that Michael, abbot of Glastonbury, dying A.D. 1253, left to his successor "quadraginta Bisancios et viginti libras sterlingorum." Chaucer names the "Besaunt" in the "Romaunt of the Rose," and Wicliffe, in his translation of the New Testament, uses the term "besauntis" for the ten pieces of money in the parable. The probability seems to be that the bezant of gold was current in England, if not from the ninth, certainly from the tenth century till the time of Edward III., when the coinage of the English noble drove it out of use.

The Nude in Art.

To make the display of the nude an essential of high art is approximating the absurd, as it amounts, except on rare occasions, to rendering high art impossible. In accordance with this view, the elevated and the beautiful can seldom be united with the probable, for how few passages in history will admit of the introduction of the naked figure, and yet how vast is the field of history wherein to display the moral and the beautiful. The skilful arrangement of drapery involves as much taste and judgment as the proper management of the nude, and the draped figure may be represented as beautiful and as dignified as the undraped. A skilful arrangement of drapery does not consist in displaying the exact form of the nude, as if the drapery were a wet sheet or blown against the person by the wind, but in showing the exact position and proportion of the covered, though not concealed parts. Raphael seldom painted the naked form, yet his figures are pre-eminently distinguished for dignity of character, and this is not owing to any display of the nude beneath the drapery, but to the position of the figures themselves, and the just arrangement of the folds of their draperies. This hankering after the nude is one of the morbid symptoms of the taste of that period. With what success such a display is made may be seen in some of the monuments in St. Paul's and in Westminster Abbey. A well-draped figure implies a thorough understanding of the nude in the artist.

NOTES AND COMMENTS.

HENCEFORTH all the operations of picture restoration will be carried out at South Kensington, and the risks of damage to which paintings were liable when they were sent from the Museum to other premises will be obviated. Mr. ARMSTRONG has been able to have the oil-paintings examined. Most of them were found to be well preserved, but in those on which bitumen was used as a pigment there are cracks through which the ground can be seen, forming a series of white lines. In such cases the lines have been tinted with tempera colours like the adjacent sound parts, but the cracks are never filled up or concealed. In many cases it was found desirable to remove the accumulated coats of varnish which, in course of years, had obscured the original freshness of the paint. This removal was always effected by chafing, no solvent being used. Where it was found that copal varnish, or some substance which would not give way to the friction of fingers, and also where there was reasonable ground for expectation that old restoration would be found between or beneath the coats of varnish, nothing but the removal of dust or surface dirt was attempted. An experiment with a landscape by G. BARRETT deserves mention. It was so brown as to resemble a work in sepia, while now it shows all the delicate freshness of BARRETT'S best water-colour work. When the varnish was in process of removal it was decided to leave untouched a small portion of the sky, about 6 inches square, so that after every other part had been effectually cleared, the contrast between the original colour of the paint, as brought to light, and its former aspect when seen through the dark and yellow mastic, might be fairly judged. While this square of brown varnish remained a photograph was taken of the picture. Captain ABNEY then employed his system of chromometry to gauge the colour within the square and that of the adjacent parts of the sky from which the varnish had been removed. The colour of each portion can at any time be therefore exactly reproduced on a screen from certain rays of the spectrum of the electric light combined in definite proportions. Such a scientifically accurate record of the colour of pictures has never been achieved before. No repainting with the object of concealing damage has been attempted in these processes. In a few instances previous restorations, which in course of time have become obvious and offensive and which would have been dangerous to remove, have been hidden or made less apparent by the use of tempera colour applied over a thin coat of mastic varnish and covered and secured by another. This can at any time be easily removed without danger, and each case has been noted in a book kept in the Museum, where every process of lining, cleaning or repairing is carefully recorded.

By a new rule of the Department of Science and Art the total of the building grants made in any one year will not exceed 10,000*l*. The regulations for schools continue unchanged, and are as follows:—The rooms for study should be not less than 15 feet high to the wall-plate, if ceiled flat, or 12 feet high to the wall-plate if ceiled to the collar-beams or the common rafter. The windows should be large, and in art schools free from mullions or small panes. The classrooms should, as far as possible, communicate with each other directly as well as by passages. When there are more storeys than one, the staircase should give access to all rooms without passing through rooms; also to cloak-rooms, lavatories, &c. The arrangements for lighting with gas, for warming, drainage, &c., should be complete. The rooms should be well ventilated by the admission of air below the gas-lights, and by the extraction of vitiated air by means of shafts carried up above the roof. Water-closets, urinals and a lavatory must be provided; the accommodation for female students must be separate. The external walls of the school, if of brick, should not be less than one brick and a half in thickness, and if of stone, not less than 20 inches in thickness. All the roofs must be either tiled or slated. Gutters and drains to carry away the roof-water must be provided. If the roof be unceiled to the tie-beam or collar-beam, there must be ceiling to the rafters. Rooms which are top-lighted should in all cases be ceiled to the common rafters in order to give increased height; and all tie-beams or other heavy roof-timbering should be avoided, and iron tie-rods used where practicable.

No grant will be given for a school of science unless there be a room properly constructed and fitted up for lectures on experimental science, and at least one room properly arranged as a laboratory for practical work in one or more subjects of science. For a school of art the following dimensions are considered to afford adequate provision for fifty students. Proportionately increased accommodation must be provided for greater numbers. One elementary room, 20 by 30 feet. This room should be not less than 16 feet high, and may be lighted by skylights as well as by side windows. One room for study from life or life-size casts, not less than 20 by 24 feet. This room should be lighted from the north side by a single large window, the top of which (carried up in a dormer if necessary) should be at a height above the floor equal to three-quarters the depth of the room, or if the pitch of the roof be steeper than 60 degrees, a skylight should be made in continuation of the windows, so as to gain the same effect in lighting. One modelling room, 20 by 15 feet. One master's room, 12 by 15 feet. This room should be lighted by a side light from the north if possible. One cloak-room for females, 12 by 8 feet 6 inches. A kitchen and bedroom for the attendant, each 12 by 10 feet.

On September 4 Mr. A. N. PATERSON, M.A., the president of the Glasgow Architectural Association, will deliver his address. In the course of the session the following lectures and papers will be read at the meetings:—"Art Metalwork," by Mr. GEORGE ADAM; "Planning of Country Houses," by Mr. WM. FRASER; "The Abbeys and Cathedrals of Scotland," by Mr. P. M'GREGOR CHALMERS, F.S.A., Scot.; "On Tramp," by Mr. J. KENNEDY HUNTER; "Planning of Farmhouses," by Mr. CHAS. J. DAVIDSON; "The Thirteenth and Fourteenth Centuries in Italy," by Mr. T. L. WATSON; "Monumental Buildings," by Mr. W. J. BLAINE; "An Architectural Chat," by Mr. J. A. MORRIS; "The Development of School Planning," by Mr. R. W. HORN; "The Monks and their Abbeys," by Mr. S. HENBEST CAPPER, M.A.; "The Early Development of the Christian Church," by Mr. W. J. ANDERSON; "The Work and Influence of the ADAMS in Scotland," by Mr. JOHN WHITE; "Decorated Gothic," by Mr. DAVID B. DOBSON. The subject selected for the competition for the travelling studentship is a village institute, comprising a large hall to seat 800 and a small hall to seat 200, with committee-rooms, library, small museum and caretaker's house. According to the last report the Association consists of 16 honorary, 70 ordinary and 20 corresponding members. It may now claim to be fairly representative of the junior members of the profession in Glasgow.

Of late years changes of diocesan boundaries are not unknown in England. In Mediaeval times, when there were no Ordnance maps on which dioceses could be distinctly laid down, a good deal of confusion used to arise. We lately described one case, viz., the county of Westmorland, which although in England was supposed to be subject to the Bishop of Glasgow. A paper which was read by Mr. S. W. KERSHAW, F.S.A., before the British Archaeological Association on "Winchester and the Channel Islands" contains much curious information about dioceses. It is shown that Lincoln extended to the border of Middlesex, while Reading, Newbury and Windsor formed part of Salisbury. Few may be aware that there was also a see of Ramsbury, which comprised parts of Wilts and Berks. The Channel Islands at one time formed part of the diocese of Dol, afterwards they came under the jurisdiction of the Bishop of Coutances. At the end of the fifteenth century they were in Salisbury, and about the same time Calais was annexed to Canterbury. In 1568 the Channel Islands were transferred to Winchester. Their history would appear to have interest for all who can enjoy ecclesiastical squabbles, for, says Mr. KERSHAW, "the existence side by side of the English with that of the foreign Reformed Church forms a striking episode in these ecclesiastical annals, and called into play many incidents which disclosed more fully political undercurrents and the complexity of State correspondence." But neither church appears to have cared much about architecture. Mr. KERSHAW'S paper must have required arduous labour, but he has succeeded in revealing much which hitherto was obscure.

NEW WESLEYAN CHAPEL, ARGYLE STREET, HULL.

THIS building, which is now in course of erection on a site in Argyle Street, Hull, is in the Waltham Street Circuit. The chapel is designed in a free Romanesque style, and will be built of bricks, faced with Lincolnshire red facing bricks, with dressings in Howley Park and Ancaster stone. The turrets will be framed in oak covered with lead, and the windows will be glazed with leaded lights. The ground floor will fall 18 inches towards rostrum. The pewing and all inside joiners' work will be in redwood, stained slightly and varnished. The ceiling will be in plaster, with modelled plaster panels, and coved on wall sides.

Accommodation will be provided in the chapel for nearly 1,000 people, with vestries, &c., at the rear, the total cost being about 3,300*l.*, exclusive of land. The work is being carried out by Mr. DAVID ROBINSON, builder, Freehold Street, Hull, under the supervision of the architect, Mr. W. ALFRED GELDER, F.R.I.B.A., of Hull. Mr. JABEZ THOMPSON, of Northwich, is supplying the moulded brick and terra-cotta.

SURGERY AND ART.

A REMARKABLE address on the relation between surgery and art was given by Professor J. Greig Smith at the meeting of the British Association of Medicine in Bristol. He said that amongst the arts and crafts the surgical stands alone in the extraordinary breadth of its foundations on science. The painter is not expected to know chemistry, botany, geometry and optics, which intimately relate to his art; nor is the sculptor supposed to be familiar with geology because he works in clay and marble. To the surgeon wide scientific knowledge is of prime importance. Something of all the sciences, a good deal of a few, and everything of two or three he must know. It was a brave display, but, he asked, is it all genuine? In the claims of the science there was a real danger that it might lose something of its art. And it was a pity that science so often killed art. Science and art should flourish together, and certainly it was so in surgery. The art of the surgeon may be viewed from two aspects. The one was allied to the art of workers in wood and iron. It was mechanical. He would place the surgeon's tools on the level of the sculptor's spatula or chisel. But the surgeon is more than a mechanic. He has work to do which brings him to the level of the true artist. The other side he compared to that which produces works of art, and this side was by far the most important. Here the work of the fingers was of small moment as compared with the work of the brain. The brain is supreme, and yet in delicacy, deftness and general preciseness of obedience to the brain's behests, the fingers and hands have great calls made on them. In painting, music or sculpture, mere manual dexterity rarely is deficient to him who has the artistic soul, or if there is, practice and education will do much to remove it. So in surgery, the hands rarely fail to rise to the demand that the brain makes upon them—if they are trained in the highest part of the surgical art—"Brain's craft" uttered through the fingers. It is not mere manual dexterity or cunning. The surgeon's art demanded breadth and variety in manual training. The highest cultivation of the sense of touch is essential to the surgeon. The sense of touch is trained through the intellect as much as through the fingers. Those who bring the sense of sight to help out the impressions of touch ought to surpass the blind in tactile power. There are no limits to the demands made in the surgeon's tactile powers. Touch is to the surgeon what hearing is to the physician, but always it is the intellect which interprets. Amongst the plastic arts sculpture perhaps gave most points for comparison with the surgical. The surgeon artist forms a clear conception of the work he has to do—makes straight for the ending of it between detail and bulk. He determinedly keeps a true artistic proportion. The finest work of the surgeon makes demand on the delicacy of the fingers little, if anything, less exacting than that made on the fingers of the etcher or the line engraver. The demand made on the hand, the eye and the brain was the same for surgery as for the fine arts. Of this art of surgery where and what is the teaching? There is no real teaching of this art in our country. Surgeons had to teach themselves by practical experience. Surgeons alone had, unassisted, to grope their way to excellence in their art. The

art can be taught in only one way of teaching. In all the plastic arts the young artist must have a master at his elbow—a master who will criticise his methods and correct them; who will guide him in the use of hand, eye and instruments; who will lead him step by step to such excellence in the art as he himself has acquired. If, then, the art of surgery is to be properly taught, it must be taught to the young surgeon actually operating. But that is only possible after the surgeon has become qualified legally. He thought that the young surgeon ought not to object to such tuition and criticism from a master. He could conceive no finer ending to a great surgeon's career than to devote it to the education in his art of the men who are to succeed him. He has handed his legacy of science to all mankind, and his art would survive in the hands of the pupil he has trained. He did not say how this was to be attained. We might ask, he said, to be put on the level of the fine arts and seek for a Royal Academy of Surgeons. To such an academy a school with teachers would be attached. The teachers would be those supreme in surgical art; the pupils, men already qualified, who sought for practice in the higher walks of surgery. Art thrives on appreciation. There is no academy to bestow gold medals on the surgical artist. No crowds gather round to admire his finished work. His science may be trumpeted far and wide. His art is known to his own small circle. It has little recognition beyond, and we let it die with him. The art of the surgeon has its best reward in blessings, not in fame.

EARLY ROAD-MAKING IN ENGLAND.

A PAPER was read at the meeting of the British Archaeological Association by Dr. J. S. Phené on "The Early Occupants of the Vicinity of the Mersey, Morecambe Bay and Manchester." When Whitaker wrote his history of Manchester it was said he laid the real foundation-stone of British archaeology, the grand *coup* being the proving, through their names and style of execution, that the roads of Britain were of pre-Roman formation. Dr. Phené avowed that the pre-Roman occupation of Britain was a commercial and hence a civilised one. After giving a description of the peculiar features of the roads, he sought to show that the pre-Roman roads of ancient Italy bore exactly the same peculiar features as the early roads of Britain; and, following this up, he gave a great variety of evidences showing a close commercial intercourse between Britain and Italy in pre-Roman times. His own surveys, studies and observations had been made without any knowledge that others had been, or were still, working in the same direction. But he was now in possession of the researches of others, which entirely supported the conclusions he had come to as to an early occupation of Britain by foreign communities who resorted here for trade purposes. He was able to show in the locality he selected evidences of two distinct Italian tribes, the Vennones and the Senones, located in Britain long prior to the Roman Conquest. These points were quite sufficient to suggest Italian occupation of a very early date and to account for the formation of roads in Britain which might thus be correctly called Italian roads. The settlements on the Mersey and Morecambe Bay (meaning "the great winding"), which, supplemented by the Great Orme's Head, formed the great winding Serpent's Head; the Lesser Orme's Head, Ormskirk, the Serpent's Temple, and other names showed the location of foreign people having a mythology common to Scandinavia and to Etruria. These Italian colonies had their *entrepôts* of commerce always at the intersection of the ancient roads, as at High Cross, where the Vennones held their stronghold in the forest of Arden unmolested by the Romans; also at the two crosses cut in the chalk cliffs near Risborough; also at the junctions of branch roads, as at Winchester and in the localities of the other great figures in the chalk. Vast figures of the serpent and the dragon were found in Latium and in Etruria, where these tribes had originally been—hence it was probable that, as the roads and ways appeared scientifically constructed on the old Italian style, these figures, in every case in the vicinity of such roads, were by the same people. The flint and bronze implements found at Holyhead and in Sussex agreed in design in many particulars. The word Arden followed the course of these people through the Continent to Rome; it was always applied to vast woods by which they located, and was clearly the old Italian word *ardente* (burning), thus revealing their traffic by smelting, and near these places crucibles had been discovered.

The Town Council of Aberdeen have renewed a grant of 100*l.* from the Corporation funds towards the support of the Art Gallery. It was stipulated, however, that during at least six months of the year the gallery should be open to the public on payment of a small charge for admission, and that, as regards the remainder of the year, the gallery should be at the disposal of the art gallery committee for special exhibitions.

THE TRUE PRINCIPLES OF POINTED OR CHRISTIAN ARCHITECTURE.

By A. WELBY PUGIN.

(Continued from page 76.)

IT is a common practice, when a chimney shaft is carried up in the centre of a gable end, for the barge-boards to be fixed before it. This is absurd; flues must necessarily stop the passage of timbers; consequently the barge-boards, which are only coverings of those timbers, should stop also (see next page).

If we examine the ancient woodwork which decorated rooms, we shall find that it consisted of mere panelling more or less enriched by carving, with large spaces left for hangings and tapestry.

but that to which they properly belong. The modern admirers of the Pointed style have done much injury to its revival by the erroneous and costly system they have pursued; the interiors of their houses are one mass of elaborate work. There is no repose, no solidity, no space left for hangings or simple panels; the whole is covered with trifling details, enormously expensive, and at the same time subversive of good effect. These observations apply equally to furniture; upholsterers seem to think that nothing can be Gothic unless it is

Panelling of Rooms.

Were the real principles of Gothic architecture restored, the present objection of its extreme costliness would cease to exist. In Pointed decoration too much is generally attempted; every room in what is called a Gothic house must be fitted with niches, pinnacles, groining, tracery and tabernacle work, after the manner of a chantry or chapel. Such fittings must be enormously expensive and at the same time they are contrary to the true spirit of the style, which does not admit of the introduction of these features in any situation

found in some church. Hence your modern man designs a sofa or occasional table from details culled out of Britton's "Cathedrals," and all the ordinary articles of furniture, which require to be simple and convenient, are made not only very expensive but very uneasy. We find diminutive flying buttresses about an arm-chair; every thing is crocketed with angular projections, innumerable mitres, sharp ornaments and turreted extremities (see next page). A man who remains any length of time in a modern Gothic room and escapes without being

Treatment of Gables.

wounded by some of its minutiae may consider himself extremely fortunate. There are often as many pillars and gablets about a pier-glass frame as are to be found in an ordinary church, and not unfrequently the whole canopy of a tomb has been transferred for the purpose, as at Strawberry Hill. I have perpetrated many of these enormities in the furniture I designed some years ago for Windsor Castle. At that time I had not the least idea of the principles I am now explaining; all my knowledge of Pointed architecture was confined to a tolerably good notion of details in the abstract; but these I employed with so little judgment or propriety that, although the parts were correct and exceedingly well executed, collectively they appeared a complete burlesque of Pointed design.

I now come, in the last place, to consider decoration with reference to propriety; what I mean by propriety is this, that the external and internal appearance of an edifice should be illustrative of, and in accordance with, the purpose for which it is destined. There is a vast difference between a building raised to God and one for temporal purposes; again, in the first of these a great distinction necessarily exists between a cathedral and a parochial church, between a collegiate chapel and a private oratory, and in the second, between a royal residence and a manorial mansion—between monuments raised for public or national purposes and erections for private convenience.

The scale of propriety in architecture must always be regulated by purpose, and to illustrate this more fully I will divide edifices under three heads, ecclesiastical, collegiate and civil. The greatest privilege possessed by man is to be allowed, while on earth, to contribute to the glory of God; a man who builds a church draws down a blessing on himself both for this life and that of the world to come, and likewise imparts under God the means of every blessing to his fellow creatures. Hence we cannot feel surprised at the vast number of religious buildings erected by our Catholic forefathers in the days of faith, or at their endeavours to render those structures, by their arrangement and decoration, as suitable as their means could accomplish for their holy and important destination. It must have been an edifying sight to have overlooked some ancient city raised when religion formed a leading impulse in the mind of man, and when the honour and worship of the author of all good was considered of greater importance than the achievement of the most lucrative commercial speculation. There stood the mother church, the great cathedral, vast in height, rising above all the towers of the parochial churches which

surrounded her; next in scale and grandeur might have been discerned the abbatial and collegiate churches with their vast and solemn buildings; each street had its temple raised for the true worship of God, variously beautiful in design, but each a fine example of Christian art. Even the bridges and approaches were not destitute of religious buildings, and many a beautiful chapel and oratory was corbelled out in massive piers over the stream that flowed beneath.

The great object I have in directing your attention to such a Catholic city is to illustrate the principle of decorative propriety in ecclesiastical buildings. We have here various edifices of various dimensions, various degrees of richness, various in arrangement, yet each bears on its very face the stamp of Catholic. Cathedral or abbey, church or oratory, they all show that they are dedicated to the one true faith, raised by men actuated by one great motive, the truly Catholic principle of dedicating the best they possessed to God. It would be both unjust and unreasonable to expect a few parishioners to erect as sumptuous an edifice to the Almighty as the clergy of a vast cathedral, and even if they could practically achieve such a result, it would be out of character for the use and intentions of a parish church; neither ought we to look to a private chapel or oratory erected by the unassisted piety of an individual for the extent or ornaments of a public church, unless indeed that individual was possessed of great wealth, and then, although not in dimensions, it should surpass in glory the usual decoration of such buildings. In a word, architectural propriety as regards ecclesiastical buildings requires

Early Victorian Gothic.

that they should be as good, as spacious, as rich and beautiful as the means and numbers of those who are erecting them will permit. The history of our present vast and magnificent churches fully exemplifies this principle; many of them in their origin were little better than thatched barns; it was the best that could be done at that early period; but when the wealth and influence of the Church increased they were soon demolished to make way for more fitting structures; these in their turn were rebuilt with still greater magnificence. The ancient clergy were never satisfied, never content, never imagined that they had done enough; the scaffoldings were round the walls and the cranes on the towers of many of the English abbeys at the time of their suppression.

falsehood, which cannot escape the all-searching eye of God, to whom churches should be built, and not to man. Even under the Mosaic dispensation, the Holy of Holies, entered only by the high priest, was overlaid with gold; and how much more ought the interiors of our tabernacles to be lined with precious material, which are ten times more holy and deserving of it than the figurative tabernacle of the old law!—and yet in these times all that does not catch the eye is neglected. A rich-looking antependium often conceals rough materials, a depository for candle-ends, and an accumulation of dirt, which are allowed to remain simply because they are out of sight. All plaster, cast-iron and composition ornaments, painted like stone or oak, are mere impositions, and, although very suitable

Front and Side of a Deceptive Church.

It is not incumbent on all men to raise vast and splendid churches; but it is incumbent on all men to render the buildings they raise for religious purposes more vast and beautiful than those in which they dwell. This is all I contend for; but this is a feeling nearly if not altogether extinct. Churches are now built without the least regard to tradition, to mystical reasons, or even common propriety. A room full of seats at the least possible cost is the present idea of a church; and if any ornament is indulged in, it is a mere screen to catch the eye of the passer-by, which is a most contemptible deception to hide the meanness of the real building. How often do we see a front gable carried up to a respectable pitch, and we might naturally infer that this is the termination, both as regards

to a tea-garden, are utterly unworthy of a sacred edifice. *Omne secundum ordinem et honeste fiat.* Let every man build to God according to his means, but not practise showy deceptions; better is it to do a little substantially and consistently with truth, than to produce a great but fictitious effect. Hence the rubble wall and oaken rafter of antiquity yet impress the mind with feelings of reverent awe, which never could be produced by the cement and plaster imitations of elaborate tracery and florid designs which in these times are stuck about mimic churches in disgusting profusion.

It is likewise essential to ecclesiastical propriety that the ornaments introduced about churches should be appropriate and significant, and not consist of pagan emblems and attri-

Christian Churches in Pagan Style.

height and form, of the actual roof; but on turning the corner we soon perceive that it is a mere wall cramped to hold it in its position, and that it conceals a very meeting-house, with a flat roof and low thin walls, perforated by mean apertures, and without a single feature or detail to carry out the appearance it assumes towards the street (see woodcut above). Now the severity of Christian architecture is opposed to all deception. We should never make a building erected to God appear better than it really is by artificial means. These are showy worldly expedients, adapted only for those who live by splendid deception, such as theatricals, mountebanks, quacks, and the like. Nothing can be more execrable than making a church appear rich and beautiful in the eyes of men, but full of trick and

butes for buildings professedly erected for Christian worship. If the admirers of Classic decoration were consistent, on the very principles which induced the ancients to set up their divinities, they should now employ other and more appropriate ornaments, as all those found in the temples and other buildings of the pagans were in strict accordance with their mythology and customs. They never introduced any emblem without a mystical signification being attached to it. It would be unjust to charge the advocates of revived pagan decoration with an actual belief in the mythology of which they are such jealous admirers, hence they are guilty of the greater inconsistency, as the original heathens proceeded from conviction. They would not have placed urns on the tombs had they not practised

burning instead of burying their dead, of which former custom the urn was a fitting emblem, as being the depository for the ashes. Neither would they have decorated the friezes with the heads of sheep and oxen had they not sacrificed those animals to their supposed gods, or placed inverted torches on the mausoleums, had they believed in the glories of the Resurrection. But what have we as Christians to do with all those things illustrative only of former error? Is our wisdom set forth by the owl of Minerva, or our strength by the club of Hercules?

Modern Tomb in the revived Pagan Style.

What have we (who have been redeemed by the sacrifice of our Lord himself) to do with the carcasses of bulls and goats? And how can we (who surround the biers of our departed brethren with blazing tapers denoting our hope and faith in the glorious light of the Resurrection) carve the inverted torch of pagan despair on the very tomb to which we conduct their remains with such sparkling light? Let us away with such gross inconsistencies and restore the Christian ideas of our Catholic ancestors, for they alone are proper for our imitation. But

not only are the details of modern churches borrowed from pagan instead of Christian antiquity, but the very plan and arrangement of the buildings themselves are now fashioned after a heathen temple, for which unsightly and inappropriate form modern churchmen and architects have abandoned those which are not only illustrative of the great mysteries of the Christian faith, but whose use has been sanctioned by the custom of more than twelve centuries.

(To be continued.)

THE PROGRESS OF ARCHÆOLOGY.

(Concluded from page 79.)

LET us now apply these lessons a little more concretely to the complicated story of human progress. If we take our archaeological telescope and look back through the avenues of time, we shall reach a period when the great civilisations of the world were still incubating, and when in Europe, in North Africa, and in Asia, the many and scattered tribes were living very much as we can see tribes now living in savage countries, some by hunting, some by fishing, and some, no doubt, leading a pastoral life. This stage in Europe and its borders is marked archæologically by what we call palæolithic or antediluvian man. Some have compared him with the Esquimaux, because the Esquimaux, like him, has artistic instincts and can draw well, and because his surroundings are supposed to have been ruder. All this is very doubtful, and, in fact, misleading. So far as we know, the cave man of Europe was completely exterminated, as his companions the mammoth and the hairy rhinoceros were, and he has left no descendants. His remains are found in the caves, are cased with stalagmite, which effectually separates them from their successors. The immigrants who succeeded them are recognised by their long, narrow skulls, by their employing domesticated animals and cultivated plants, and by their burying their dead in long barrows. Whence they came we cannot positively say, but we may reasonably conjecture it was from some country where the animals and plants just named were indigenous in the wild state. In these graves in Britain no metal objects have been found, no tongued or barbed arrowheads, while the pottery is of the rudest character, marked by cylindrical shapes.

In one respect these long mounds present us with a puzzle. We can hardly doubt that among barbarous races few things are more likely to have been closely studied and more important, and yet we find the practices of burial and of cremation both in vogue. It has been thought that the two practices were, in fact, contemporary from the commencement. In this I cannot agree. In the South of England burial was almost universal among the long barrow men. In Scotland, on the contrary, cremation; but Mr. Anderson has shown that even there burial seems to have preceded burning, and it seems to me that burning the dead body was distinctly an innovation introduced by the men who succeeded those with the long heads, and that originally it was unknown among these men. Again, there is another curious distinction, which is apparently a superficial one. When stone was not to be had the bodies were laid on the ground in a more or less crouching attitude, and covered in. Otherwise, chambers were built of boulders or other rough stones, which were approached by long galleries open to the outside, apparently simulating underground dwellings, in which whole families or clans were buried. These, again, were sup-

planted, when the new men with round heads came in, by stone boxes or cists closed all round, the introduction of which was, in general, coincident with that of burning, although there was undoubtedly some overlapping.

Who, then, were these long-headed men? The early long-headed race of Britain has, according to fair evidence, left its trace in Europe in the long-headed, dark-skinned, black-haired Basques, and in Britain itself they seem to have survived in the Silurians of Glamorganshire (described by the Roman writers) and in the small black-haired people of South Wales and of parts of Ireland. Traces of the Basque language have been said to be found in the Celtic languages, but this particular branch of the field has been hitherto very little explored, nor have the local place names in those districts where the race may be supposed to have survived. Then we seem to have a clue which points to the men with the long heads having come from the south-west. The Basques have their nearest relations in North Africa, where a race which buried, and did not burn, its dead once occupied the country, whose remains are still to be found among the Berbers and Kabyles of the Atlas range and among the Guanches of the Canary Islands. And these races of the Atlas take us on again to the Valley of the Nile, where the early Egyptians are now recognised to have had close relations of blood, &c., with them, and who were, as you know, almost fanatically devoted to the practice of burial, as contrasted with burning, in disposing of their dead. In this behalf it is curious to remember the distribution of the so-called cromlechs, which are merely chambered tombs of another form. They are found all round the northern part of Africa, in Spain, in the maritime parts of Gaul, all over Britain, where they have not been displaced by the plough and harrow. They abound in Holland, and occur again in Scandinavia, specimens of their primitive stock having migrated from West to East in Europe along the sea-board. This line of migration leads us to the Nile Valley as a goal, and it seems to some of us that the earliest inhabitants of that valley were first cousins of our long barrow men. Then, under favourable conditions of a pure climate and access to the necessary tools and weapons of culture, there developed a race which, although unacquainted with metals, produced a wonderful culture—that of the Egyptians of the old Empire. We have as yet found no traces of a beginning of this culture on the spot, and until quite recently, when Professor Petrie has made some remarkable discoveries at Koptus, which may throw some light on this aspect, we seem to have in the monuments of the fourth and fifth dynasty every kind of excellence we associate with Egyptian art fully developed, including its hieroglyphical writing, its strange mythology, &c., and all the while Egypt was still in what the Scandinavian antiquaries describe as the stone age. Whether this art was imported with the race which developed it in the Nile Valley, or was entirely indigenous, we do not know. It may be that it was the discovery of the ancestors of the tribes who are now represented by the Bishir Kadanlowahs and other wild tribes of the Eastern Soudan, or by the Bishirs of the Atlas range, who border the Nile Valley on either hand, and must have done so for a very long period. One thing seems clear, that for a very considerable period the art of the Nile Valley was isolated, and does not seem to have affected that of its neighbours. To us this art is supremely interesting, because we can trace its progress step by step through manifold vicissitudes for 4,000 years. Let us now return again to our own country.

The long-headed people here were displaced very largely by a race with round heads, who burnt their dead and put their ashes in beautifully constructed urns, and then deposited them in stone cists or boxes in round or saucer-shaped and not in long barrows. As we have said, there was considerable overlapping between them and their predecessors, who adopted in some cases their customs, including that of burying in round mounds or barrows. The shape of the skulls of these new men shows us what a profound racial difference there must have been between them and their predecessors. They apparently came from another direction, and with different surroundings. So far as we know, they were the first wave of that migration of tribes from the East which have successively followed each other in Europe, and are represented by the earlier Celts in central and southern France and large parts of Spain, and among the Irish or Scottish Gael. Just as their art-remains proved the round-headed folk to have mingled with other predecessors, so do we find among these earlier Celts evidences of mixing with their predecessors, the Basques.

If we follow our maps eastward, and track the steps of those races who burnt their dead, we shall find them linked step by step, if not by race by a certain relationship, in their arts to the early dwellers in Mesopotamia. There a similar development of culture to that we all know so well in the Nile Valley, and likewise in the stone age, took place in the valleys of the Euphrates and the Tigris. Here, however, we seem to have evidence that the culture was not home grown, but there are reasons for believing that the men who founded the earliest known communications with Chaldea brought with

them the arts by which we know them from the Elamitic mountains to the East, whence they seem to have sent colonies westward into Mesopotamia and eastward into China. This curious and interesting induction is one of the most important discoveries of recent years. It enables us to link the culture of the furthest East to that of the West, and it also enables us to conclude that the arts are not the peculiar heritage of any one race, for here we seem to be compelled to admit that the formation and venue of that culture that we call Aryan or Indo-European is really among the now despised Turkish and Finnish races. It was a race very nearly akin to Laps and Finns which certainly invented the cruciform writing, and apparently developed the earliest religious system in Chaldea.

From this race it was directly learnt by the Semitic races, whose original home was Arabia, and whose enterprise and vigour distributed them far and wide. One thing we must remember, that so far as our present evidence goes, the arts of Babylonia were as different from those of the Nile Valley as the language, the mythology and the appearance of the people were. These Semitic peoples founded the successive kingdoms of Babylonia and Assyria, but it was the Phœnicians who were chiefly instrumental in multiplying and distributing the wares which the older men of Mesopotamia had made. They were to be found trading and trafficking everywhere, from far-off Britain to far-off Thule, and still further to that land of mist and snow where the dragons were supposed to guard the gold deposits of Siberia. Their settlements and trading ports were to be found all over the Mediterranean. These same Phœnicians were also great metallurgists, and if not the discoverers of bronze, which added so much to the renown of the early craftsmen, they were so far as we know the great distributors of the knowledge of making and also of the materials of it.

Let us revert once more to northern Europe, and notably to our own country. It was during its occupation by round-headed people that the use of bronze was first introduced here. Gold was apparently their own discovery, but bronze, I believe, was an imported art, and had nothing to do with the introduction of a new race. The bronze workers, as we know from the numerous hoards discovered, and also from the numerous moulds which have been found, were travelling tinkers and metallurgists, such as the metal-workers of Finland still are, and as the Mediæval goldsmiths in Scotland were. The weapons, ornaments and tools are of the same type, differing in slight details only, from one end of Europe to the other, and showing that the art was spread over a wide area occupied by many races, and it seems to have spread from the Mediterranean lands perhaps by the agency of those traders who took Baltic amber to Greece and Italy, and who in the first instance were probably the Phœnicians. It is curious that this bronze culture should have advanced to very different stages of style and elaboration in different areas. In Spain it advanced only to a small degree, as we may learn from the explorations of my friends the Brothers Siret. In England and France considerably further. In Scandinavia and Hungary further still, and I would suggest as an explanation that the reason is that in Spain and the western countries bronze was displaced by iron at an earlier date. Thus, while in Scandinavia we have no reason to suppose that iron was used until about the Christian era, in Britain it must have been used several centuries earlier. Thus the later and more developed bronze culture of Denmark and Hungary corresponded in age, and was synchronous with the earlier use of iron in Britain and probably also in Gaul and Spain, and hence it represents a later and more developed art. As I have said, the introduction of bronze was the introduction of a new art and not a new race, and it is a great mistake for people to wash off the bronze folk as if they were nothing different to the iron, wood and stone races.

The next art revolution in their latitudes did, however, mean the importation of a new stock. This was coincident with the introduction of iron. This problem, as it presents itself in Britain, is one of the great puzzles of early archaeology, for it means a great deal more than the mere introduction of iron for cutting weapons and tools; it means the introduction of an entirely new style of ornament, consisting of the most graceful scrolls known as trumpet scrolls of endless variety and taste. Alongside of this we have the most wonderful skill in metallurgy. Nothing can exceed the delicate manipulation with which the old artificers fashioned the objects of manifold shape and of entirely new designs, bone tracings, shields, helmets, sword and dagger sheaths, spoons, mirrors, &c., and the dexterous way in which they ornamented them with enamel, which they were, apparently, the first to discover and to apply. These objects have occurred in the greatest numbers in Great Britain and in Ireland, but they have also been found in Belgium, in Eastern France and in certain parts of Switzerland, such as La Teûle, &c., and it would seem, therefore, that they reached us by some migration down the Rhine. One important fact about this art is,

that we know its relative date. We know that it was living when the Romans conquered Britain. The remains of the early Roman conquerors are found buried with objects of this date in the hill parts of Dorsetshire, &c., and the descriptions of Cæsar apply to this charioteeing people. Not only so, but it survived in that part of these islands untouched by the Roman Conquest, namely, in Ireland. The art of Ireland until it was displaced and sophisticated by the Norsemen was a mere development and growth of this art, and it is found abundantly exemplified in the so-called letter ornaments illustrated by Westwood in his work on Irish MSS. How long it had flourished here before the Roman Conquest and at what date it displaced the art of the bronze people we do not know. As I have said, this same art is found in the Rhine Valley and in Switzerland; it is not found in Denmark and Germany, where the objects of the iron age have an entirely different origin and different history. Nor, again, is it found in Western France or in Spain, and the only avenue, therefore, by which it can have reached Britain is that found out by my friend Mr. Arthur Evans, namely, the valley of the Rhine. In his very original and suggestive memoir on the subject he traces this art to Switzerland. There it seems to have incubated and developed itself in contact with the art of the Etruscans, with which at some points it has an analogy, but as a whole its inspiration is not Etruscan, but it goes back further to that primitive Mediterranean art which, for lack of a better name, we call Mykenean—the art of the Homeric poems. It is in the Mykenean objects that we find the same scrolls and the same dexterous manipulation of metal and the use also of enamel. The distinction, of course, is that the use of iron had been meanwhile introduced. This, however, was only for cutting objects; the ornaments, the sword sheaths, the shields, helmets, mirrors, &c., all continued to be made of bronze. The introduction of iron merely displaced the kind of metal and did not affect the art, nor did it do so in Denmark or in the far West. The art in both these places no doubt grew, but it grew out of the old art of the bronze age, supplemented by new models and new objects imitated from those which traders brought from Rome and elsewhere. To revert for a sentence or two to the people who developed and used this later Celtic art, who also used coins. These coins have been traced partially to the early coinage of Marseilles and partially to the coinage of Philip of Macedon, large quantities of whose gold statues were probably taken back by the Gauls after their invasion of Greece. The gradual sophistication of these fresh models has been traced and followed out by my friend, Sir John Evans, with his usual ingenuity and acumen.

On another side we seem to have evidence that Druidism, which differed from the old polytheistic religion of the Gauls and Germans, which was related to the religions of Rome and Greece, was imported from the far East, and, having apparently reached Thrace, was carried back with them by the Gauls who invaded Greece, and who thus acquired the notions of metempsychosis, &c., and I am not at all sure that the old notion of Godfrey Higgins, which has not had many adherents lately, is not true—that Druidism was largely the outcome of the teaching of the Buddhist monks, who, we know, penetrated into Persia and Syria, as they spread the ideas and the artistic instincts of India further east from Japan to Java. But to return to Europe.

The art I have been describing, which has been styled neo-Celtic by Sir A. Wollaston Franks, who has done so much to illustrate it, was imported by a new wave of population, to which the name Belgic has been given, and whose original home was apparently in Switzerland and South Germany. This race is now best represented by the Welsh and Britons, but we must not forget that it also had large colonies in Ireland, where neo-Celtic art became predominant, and where it outlived the Roman domination elsewhere. In Great Britain, as on the Continent, this art was displaced, as the art of so much of the world was, by the Romans—itself a daughter of Greece. It is not my purpose to discuss such a well-known subject as Roman art. I would only point out to you how the newer school of archaeology has shown that Roman art was very largely the art of the Roman provinces, and not so much Italian. Alexandria was a great centre of silversmiths and other artistic metalwork; Treves and Cologne and Lyons and Clermont of pottery, of glass and also of metalwork; and there can be no doubt that Greece, both continental and insular, continued to be under the Roman domination a fertile mother of sculpture, architecture, &c. Rome was the great assimilator and distributor of these various provincial wares, as her language became the *lingua franca* of half the known world; her laws embodied and displaced other forms of jurisprudence, her generous Pantheon welcomed the foreign gods, and her military system mixed and mingled the natives of very different countries and climates. I would only say, by the way, how necessary it is that we should have a complete survey of Roman Britain such as has been begun so well at Silchester, and how some of us long to see the spade put into your own Uriconium.

When the Roman capital was removed to Byzantium new

and fresh ideas were apparently developed, or perhaps old ones which had been localised there were distributed in all directions. In one direction Parthians and Sassanians drank at the well, and it is not possible now to say whether the embroideries, the damasks, the silver bowls, &c., which we associate with these eastern peoples were Byzantine or not. In another direction the art of Byzantium spread all over the Teutonic world. The art we call Teutonic is really Byzantine. The tribes which were planted on the various frontiers of the Empire and were largely in its service and its pay were all directly indebted to Byzantium for their art. Hence we find the same art with slight local differences among the Goths of the Crimea, the Lombards in Italy, the Burgundians in Austria and Switzerland, the Alemanni on the Rhine, the Merovingians in Gaul, the Angles and Saxons in Britain, the Visigoths in Spain, the Vandals in Africa and the early Scandinavians in Denmark and Scandinavia. The cloisonné jewellery, the interlaced dragon patterns, &c., all of which have such a common likeness, have an equal resemblance to the work which we can trace to the Queen of the Bosphorus, and as Lindenschmidt was never tired of preaching, there is no Teutonic art. The art of all the Teutonic tribes who founded the modern States of Europe was in reality the art of Byzantium, and this was so in later times also. The art of the Carolingian empire and of the later Anglo-Saxons was the art of the exarchate of Ravenna, just as the art of south-eastern Europe, as preserved in the churches of Kiev, was the direct daughter of Constantinople. The enamels, the bronze works, the ivories, the illuminations on the books, the jewellery, &c., are all directly traceable to the same opulent mother.

But it was among the Arabs that the seeds of Byzantine art flourished and thrived the most. The Arabs themselves in regard to art were always a sterile race. Like their own sands they do not seem to have had the instinct for art, but they had the instinct of government, and at Bagdad, at Cairo and at Granada they founded communities which are as famous as any in the world's history. They had the Semitic instinct, too, for making money, and, having made it, for spending it freely as munificent patrons, but they initiated nothing. When we speak of Arab art we mean the art of Byzantium, which had a curious Renaissance of its own under the impulse of fresh ideas gathered together from every wind of heaven by the enterprise of these Arab traders, who crossed all the known seas from China to the Straits of Gibraltar. Cæsarea, Antioch, Damascus and Alexandria, the mother of Cairo, were Byzantine cities with flourishing arts before the Arabs annexed them, and, so far as we know, the arts of Damascus and of Cairo were the daughters of Byzantine art. The mosques of St. Sophia and of Omar were Christian churches before they became the models for the stately buildings of the later caliphs. Embroidery, pottery and glass and metal-working, including damascenery and bronze casting, all passed from Byzantine craftsmen to those of Arabia, and the chief development they received was in response to the injunctions of the Prophet against the making of graven images and of painted representations, which compelled those employed by the Arabs to devote their energies to developing conventional ornamentation and so-called arabesque work. Their contact with the Chinese and the Hindoos enabled them in pottery, and probably also in bronze work, &c., to supplement the lessons they learnt nearer home with fresh lessons from the farthest East. And then came a curious phase, as is often the case in the modest life of our homes; the daughter, having outgrown her mother's teaching, returned some of the lessons and became in turn the fruitful mother of new ideas and of a new inspiration. From Egypt and from Syria art workmen found their way to Venice and Pisa and other Italian towns, and started men along new roads by presenting them with new models. The glass, the brass-work and the pottery of Venice, when Venice headed the Renaissance of the industrial arts, were all the children of Eastern workmen imported by the rich Republic. Another wave of Mohammedan art influence passed through North Africa into Southern Spain and its islands. There the lusted wares known as the majolica had, if not their origin, their great development, and thence they were transplanted to Italy. The fine tiles which the Moors made were widely imitated, as their azulejo by the Spaniards, and thence also largely came the astrolabus, the clocks, and other inventions which Arab science had produced.

One feature in the panorama we have hastily traced is obvious, namely, that it has been the nations and peoples with great mercantile enterprise who have not only been rich enough to patronise, but who have also been in contact with fresh ideas, which have given art its new departure. The Flemings at Bruges and the Hanse traders all over the Baltic accumulated and developed ideas which they picked up at Novgorod and in the far-off districts of Perim, &c. On the other hand the Venetians and the Genoese had their factories all over the Black Sea and among the isles of Greece. They shook hands then with the caravan traders from China and from the far countries of Siberia, and had to supply each other in return

with objects suitable to their tastes and needs. The Mongols were masters of the greater part of the Asiatic world. Their ruthless conquests drove the artificers of Persia into India and into Egypt, and in either country a great rejuvenescence of the arts took place at the same time in the same style, and it is a most curious piece of history as well as interesting in art to compare the tombs of the caliphs at Cairo with those of the Pathan sultans at Delhi. Then the Mongols themselves became civilised and settled, and their artificers crowded back and brought new ideas with them, and at Tiflis and Samarcand erected buildings and decorated them in a manner previously unattained. Not only so, but great masses of workmen were transported eastward and westward under the control of the same exacting masters, and thus the designs on Chinese porcelain—the phoenixes and dragons, &c.—invaded Persia, and similarly the Chinese learnt how to make what we call blue-and-white porcelain, which they did not know until the time of the Ming dynasty.

To take one more illustration. We cannot wander about the glorious ruins of your county—such ruins as Wenlock Priory—without being reminded of the lessons in every stone. It is not only that we realise how much we owe to Gregory and to Augustine, who planted Christianity here, to Benedict and St. Bernard, and their indomitable disciples and scholars, who reared aloft high standards of purity and simplicity of work, and of duty in a community which was disintegrated under the influence of a barbarous soldiery and of brutal and uneducated manners. We are further reminded, as we can almost hear the jingling spurs and iron encased feet of the knights trampling down the aisles, that it was the romantic enterprise of the crusading nobles, prelates and monks which brought back the genius of Gothic architecture to Europe and the taste for poetry, for sentiment and for art which they had learnt from the Saracens, followers of Saladin, and it was very largely their handiwork that flooded Western Europe with new ideas, which blossomed in the magnificent images of our minsters, and the equally fresh and novel ideas which Froissart and Chaucer and Malory enshrined in immortal verse and prose.

I do not propose to carry this disintegrated story further. My purpose and object have been to press home as a universal factor of human progress the element of continuity which we all concede in regard to particular cases, and also to press home the lesson that we cannot do justice to our subject if we limit our horizon, as we are apt to do, to our parish, our county or our island. These are only outlying pieces of much larger areas, and the true way of studying and of profiting by the study of art is not only to be catholic, but to be continually conscious of its interdependence and continuity.

Lastly, one lesson let us carry away with us. We forget the humility which becomes the students of the venerable past. If it is true that we are the heirs of all the ages, it is true also that the memory of much of our inheritance is blighted and sophisticated. It is not exhilarating to our vanity and self-respect to think that human progress is not a continual growth, that men reach levels very often which those who come after cannot emulate. The men who built the Parthenon, no less than the unknown architects of so many of our great minsters, the artificers who manufactured the lovely embroideries, the matchless tiles, the radiant decorations of the Alhambra and the Taj at Agra have left no heirs, and we are mere scholars sitting at their feet. Our strength is not great enough to carry the lamps which they carried in so many ways. Every generation of men, it may be, has its triumphs, yet it is not altogether reassuring to think that in the great meeting in the happy hunting-grounds, beyond the screen of night, it will not be the nineteenth century which will occupy the foreground. Homer will still lead the procession of the poets, Socrates of the moral philosophers, Phidias of the sculptors, Raphael of the painters, and not only so, but we shall have to give place to many unknown and unchronicled masters of their craft in the days of old. When that day comes I know not what I shall say to the archæological giants, whose disciple alone I can claim to be, for my presumption in addressing you in this incoherent fashion, save to remind them that if the men of Shropshire have not all the gifts of their forefathers, we still command the virtues of patience and long-suffering, of urbanity and kindness; and I may be allowed to conclude with the hope that the sun may continue to shine brightly on your homes. *Floreat Salopia!*

A Copy of the supplement to the *Egyptian Journal Officiel* containing a statement of the conditions under which architects are invited to compete for the prizes—amounting in all to £1,000—offered for the best and four next best designs for the new Museum of Antiquities at Cairo, can be seen at the Commercial Department of the Foreign Office, London, between the hours of 11 A.M. and 6 P.M. It is hoped that additional copies of the programme will shortly be at the disposal of persons who may decide to compete.

MONUMENTAL BRASSES OF SHROPSHIRE.

A PAPER on the Shropshire brasses was read by Mr. Mill Stephenson, F.S.A., at the meeting of the Archaeological Institute. He said:—Shropshire does not afford a large field for the study of this class of memorial—more incised stones are to be found in the churches—consequently, as in all stone countries, fewer brasses are to be looked for. As far as I have been able to ascertain but eighteen brasses with effigies remain in the county, though two others are reported to exist at Clun and Upton Cressett. These I have as yet been unable to investigate. Others may also be brought to light in the remoter districts, and I would suggest that the Shropshire Archaeological Society should find some member with leisure to visit all the churches in the county and make a complete list, including at the same time a list of the incised slabs and of the effigies on high tombs, such lists to be eventually published in the Transactions, and added to from time to time as new discoveries take place. These lists would be of great service to all workers in this line, and by their aid a check would be placed on an attempt to alienate them from their respective churches. It so often happens that after restoration some brass, or part of a brass, is missing. This more especially occurs in the case of fragments or little-known brasses. The larger and well-known examples can take care of themselves, for they are well known and constantly inquired for, but the less known, though equally valuable, examples are constantly in danger; either they are lost through sheer ignorance of their value or else they are divorced from their original stones and placed on the walls of the church as ornaments. Take the case of the brasses at Withington, in this county. When the church was rebuilt they were taken out of their original slabs, and were for some time in the custody of a neighbouring incumbent. Eventually they were returned to the church. There was nothing left to show how they should be arranged, so they were nailed to the tower wall, with the result that one shield belonging to the Only family now appears under the effigy of Adam Grafton, a former parson of the church. A more serious injury was done to the brasses by the use of iron nails, which, as might be expected, produced corrosion. Brass screws or rivets should alone be used in cases where it is absolutely necessary to remove a brass. To return to the subject before me, the brasses of the county may be roughly divided as follows:—Armed figures sometimes accompanied by ladies, 6; civilian ditto, 5; ladies alone, 2; ecclesiastics, 4; curious (shrouded figures), 1—total, 18. Inscriptions alone are not included in this list. A few are exhibited to-night, but the list is not complete. Brasses at Harley, Ightfield, Middle, Tong (Ralph Elcock, 1510), and Withington exhibit marked peculiarities, and are probably the work of some local artist, possibly of a school of metal-workers established at Coventry in the latter half of the fifteenth century. A good deal of their work is to be found in the adjacent counties of Warwick, Stafford and Northampton. The fine brass at Acton Burnell may also belong to a local school, but in this case a northern origin must be looked for, and in all probability it may be attributed to the earlier provincial school established either in Yorkshire or Lincolnshire, more probably the former, in the end of the fourteenth century. Much of their work remains in these two counties. Of these local schools of engravers very little is known except in the case of the Norwich school, where some trace of a family named Brasier, bell-founders and brasiers, has come down to us. The finest military effigies in this county are the ones at Acton Burnell, 1382, to Sir Nicholas Burnell, lord of the manor of Holgot, and that at Tong to Sir William Vernon, constable of England, 1497. The later examples at Harley, c. 1475, Middle, c. 1490, and Withington, 1512, all belong to the local school, and exhibit marked peculiarities. At Adderley is a very late example, of date 1560. There are no early examples of civilians to be found in the county; all five examples belong to the last half of the sixteenth century, and present no points of interest. Of ecclesiastics there are but four examples, but one of an unknown abbot, c. 1390, at Adderley, is of great interest. So far I have been unable to identify him. He has unfortunately lost his head, and the rubbing exhibited does not show the indent as it should do. The abbot wears the amice, alb, dalmatic, maniple and chasuble, but has neither the tunic, stole, sandals nor gloves. In his right hand is a crozier, and in his left a book. The next example is a small figure at Tong to Ralph Elcock, 1510, a brother of the college. He wears a cassock, surplice and amice. The figure is of local origin, and the inscription is somewhat blurred. In the same church is a fine figure to Sir Arthur Vernon, warden of the college and rector of Whitchurch, 1517, showing him in the dress of a master of arts of the University of Cambridge. Above the figure is a very pretty little chalice with a rayed wafer inscribed "I.H.S." The last of the series is a figure in cassock, surplice, almuze and cope to the memory of Adam Grafton, "the most worshipful priest living in his days," but at the same time a great pluralist, for the inscription states he was not only chaplain to King Edward V. and to Prince

Arthur, but also Archdeacon of Stafford, Warden of the Battlefield, Dean of St. Mary's College, Shrewsbury, and Parson of Withington, where apparently he was buried. This is also a local figure.

EDINBURGH SCHOOL OF APPLIED ART.

THE following awards have been given in the Edinburgh School, of which Dr. Rowand Anderson is the director:—Class of General Design.—Architectural designers; second year students (first section):—1 and 2, John Stewart and Alfred Greig (equal), 5*l.*; 3, John S. Syme. Second section:—1, James H. M'Lachlan, 3*l.*; 2, James H. Rutherford; 3, Hal Wright; 4, Wellesley Bailey; 5, A. Balfour Paul; 6, Alexander Law. First year students (first section):—1, Andrew Muirhead, 3*l.* Second section:—1 and 2, James Smith and George Henderson (equal), 1*l.* 10*s.*; 3, Arthur J. Driver; commended, Edward J. M'Ardle. Decorators.—Second year students:—1, John M'Isaac, 3*l.* First year students:—1, James Ballantine, 2*l.* Furniture Designers.—Second year students:—1 and 2, John D. Trail and John Ednie (equal), 3*l.*; 3, Wm. Simpson. First year students:—1, Robert Reid, 1*l.* 10*s.* Masons, Plasterers, Wood-carvers, &c.—Second year students:—1 and 2, Alexander Kelman and Robert Aitken (equal), 3*l.*; 3, George Hunter, 3*l.* First year students:—Commended, John Horne. Silver-chasers and Engravers.—Second year students:—1, John Hutchison and Thomas Pringle (equal), 3*l.* First year students:—1, Alexander Reid, 1*l.* 10*s.* Colour Class.—Second year students, morning class:—1, Alfred Greig, 5*l.*; 2, Hal Wright and John S. Darlington Proposed New School Competitive Designs.

SIR,—My attention has been called to a paragraph in your last issue referring to these designs, and stating that Mr. E. R. Robson, architect, London (to whom the designs had been submitted by the School Board), had placed them in the order given in your paper. Mr. Robson did not place any other plans in order of merit beyond the first and second.

I think, in fairness to the other competitors, this letter should appear in your next issue.—Yours truly,

F. T. STEAVENSON, Clerk to School Board.

Darlington School Board, Clerk's Office:

August 8, 1894.

GENERAL.

Mr. J. L. G. Mowat, the senior bursar and librarian of Pembroke College, Oxford, who committed suicide on Monday night, was an enthusiastic student of archaeology, and had just returned from a survey of the Roman wall. One of his last acts was to draw a cheque for his subscription towards the fund for exploring that work.

The Directors of the Halifax and Huddersfield Banking Company, Limited, offer two premiums of 100*l.* and 50*l.* for designs for a bank to be erected in Commercial Street, Halifax.

Mr. J. H. Appleton has been appointed head-master of the School of Art at Oldham. He was formerly assistant-master at Lincoln.

The Hull Town Council have considered various sites proposed for the new buildings which will be used for the public hall, technical school and free library. It was decided to select one in Albion Street which will cost 57,000*l.*

Mr. F. M. Simpson has been appointed professor of architecture in University College, Liverpool, and will consequently have direction of the Municipal School of Applied Arts.

The Dresden Gallery has secured Lord Dudley's *Death of St. Clara* by Murillo for the sum of 3,000*l.*, which is considered a large price in Germany.

Mr. William Gibb, of Edinburgh, has received Her Majesty's permission to select subjects and make water-colour drawings of objects in her private collection at Windsor Castle for an important work on naval and military relics.

The Late W. Calder Marshall, R.A., has, it is said, left property valued at 48,000*l.*, but this may include his unsold works, which are numerous.

The House of Commons Improvements which will be carried out during the recess will cost about 14,000*l.*

The Architect.

THE WEEK.

BUILDERS have often reason to believe that building acts and by-law committees are rather arbitrary, if not despotic, in their dealings. It is supposed that much is done of a disagreeable sort, especially when the owners and builders are not influential. The people of Carlisle will soon have an opportunity of judging whether the urban sanitary authority of that city does or does not resemble many other authorities, in permitting an infraction of the by-laws because the culprits are supposed to be a higher class than the majority of people who are concerned in buildings. A flagrant breach of by-laws has been committed: a wing has been added to the local infirmary, although the plans were not approved. It appears plans were sent in by Mr. FERGUSON, the architect. The committee directed that the cross walls should not be less than 4 inches thick. The plans were withdrawn, and others, with amendments, were not submitted. That would be acting according to precedent, and therefore unworthy of a man of spirit. Not only was the sanitary authority snubbed for its presumption, but it was reviled because it did not take the prompt action that was necessary. In a document issued by Mr. FERGUSON it was said "the board of health objected to the plans submitted on the advice of the city surveyor; that partitions between the bedrooms were cross walls and must therefore be of specified thickness; that 4-inch drain-pipes should not be allowed on account of an alleged agreement of the committee to that effect. No notice, however, was taken of these illegal objections, there being a strong infirmary committee." To suggest that a public body is cowardly and afraid of a strong committee is like a revival of the preliminaries to a scrimmage in the old days of border warfare. But whatever may have been the case in those days about Carlisle, it is no longer, we hope, considered there a sign of strength to be a law-breaker. Wrong has been done, and it is the bounden duty of the sanitary authority to assert the law. The wing has been raised by means of donations, and we suppose another appeal will have to be made to the benevolent if it should be demolished. Let the consequences be what they may, it is necessary to demonstrate, and without any compromise, that by-laws are to be general in their application. The fiery spirits of the northern city may rebel against the petty laws which tradesmen administer, for we suppose some of the citizens must, like SIMON TAPPERTIT, feel it is irksome to drag out an ignoble existence "unknown to mankind in general," and as they cannot be raiders, brigands, genteel highwaymen, or corsairs, they have to be satisfied with illegalities for which the innocent can be made to suffer.

AN ingenious point was raised by Mr. TOBIN, the solicitor for Messrs. MONK & NEWELL, the contractors, in an action against them for damage to roads which was lately heard in the Birkenhead County Magistrates' Court. The claim of the Wirral Highway Board was for 410*l.* 10*s.* 7*d.*, and arose out of the transit of materials for the Connah's Quay and Birkenhead Railway. For a long period a traction engine, weighing from ten to twelve tons, with trucks of rails, sleepers, &c., passed over the roads, some of which were only constructed for agricultural traffic. When a summons was issued the contractors offered 100*l.* in settlement of the claim. The surveyor to the Highway Board gave evidence that beyond ordinary expenses 310*l.* had been spent in Burton Road, Nessie Road and Denhall Lane, besides 109*l.* 7*s.* 5*d.* on Storeton Lane. The solicitor elicited in cross-examination that the surveyor had given a certificate for the expenses incurred on the four roads up to December 7 of last year, which showed that the extraordinary expenses amounted to 285*l.* 6*s.* 11*d.* On May 31 he gave four certificates, amounting altogether to 419*l.* 10*s.* 7*d.*, including the 285*l.* 6*s.* 11*d.* certified in December. The difference between these sums was 134*l.* 3*s.* 8*d.* It was contended that the Highway Board should have recovered the sum certified for on December 7 within six months after the certificate was issued. As they had not done so they could not now recover under the new certificate issued

on May 31. The magistrates adopted Mr. TOBIN's view, and 285*l.* was struck out. Messrs. MONK & NEWELL offered to pay the balance if no further proceedings were taken, but the offer was declined. After hearing evidence on both sides the magistrates ordered the payment of 129*l.* 15*s.* It generally happens that when roads are used by contractors excessive demands are made, and it is only equitable that some points should be allowed, by which charges are modified.

It is a long time since the Libyan desert was brought under public notice. BAYLE ST. JOHN's book was considered to have exhausted the subject, at least for a couple of generations; and many other regions were discovered which possessed the interest of novelty. Mr. HERBERT WELD-BLUNDELL was able to excite some curiosity about the desert by a paper which he read before the British Association on Monday. At Abbas he saw an extensive tract of ruins dating from the Roman occupation, the central point being a large square fortress fitted inside with a complete system of small vaulted cells and surrounded by groups of ruined buildings, all showing the same series of round arched vaults. They show no definite plan of arrangement, and may have been simply the various buildings in which prisoners were confined. Mention of penal settlements was met with among Egyptian monuments dating as early as the nineteenth dynasty, and they are alluded to by various Christian writers. Within the precincts of the prison grounds was a half-domed temple, with Christian inscriptions rudely scratched in Greek letters. Apparently through the silting up of the wells, which were very elaborately vaulted and tubed underground, or in consequence of earth movements, the water supply failed, and the place was entirely abandoned from Roman days till about twenty years ago, when a runaway camel was followed and traced to the spot. Another place, called Muth, is a village which deserves attention from French Impressionists, for it is built on a mound of bright golden ochre, the streets and people being covered with a bright yellow dust, a relief to the usual dull mud colour of an ordinary Egyptian village. Gasr is principally interesting from the vicinity of an Egyptian temple of the second century of our era. The walls inside and the chambers are thickly inscribed with hieroglyphs, but the work is late and inferior in artistic quality. At Siwah are the remains of the Temple of Jupiter Ammon, but there is not much remaining of the oldest of the oracles to indicate its plan and appearance. Mr. WELD-BLUNDELL's paper was one of the most interesting of those read this year in the geographical section.

A DESCRIPTION of the city of New York has been issued by the Otis Elevator Company, Limited. The illustrations of buildings are most numerous, and suggest the character of public, domestic and ecclesiastical architecture in the great city. The number of lofty buildings introduced is remarkable. We may in this country criticise unfavourably the excessive height, as if the whole question was one of style. But it should be remembered that in New York, as in London, business is concentrated within a very limited area, and the owners of the ground naturally desire to derive as much revenue as possible from their property. The Otis elevators have removed all the difficulties that used to belong to height. The use made of them is suggested by the plan of the Havemeyer Building, in which seven elevators are seen. The Morse Building may be considered as being the earliest of the modern high buildings, but offices are in course of erection for the American Tract Society which will be double the height. What makes the buildings possible and profitable is the abundant and rapid elevator service, so that any tenant entering a building, or a visitor intending to call upon an attendant, is sure of an instant and very rapid transit to the floor desired. It is also the practice for a certain number of elevators to make no stop below a certain floor, so that persons seeking the upper floors would take what might be called an express elevator, which would not stop, say, before the tenth floor, and thereafter as might be required. No less remarkable is the safety with which the countless journeys are accomplished by the Otis elevator.

ENGINEERING CONSTRUCTION.*

IF iron and steel were endowed with voices they could set up a claim not only to pre-eminence as materials of construction, but as having inspired more books than all other materials during the last half century. It is only necessary to compare a list of engineering books which appeared before and after the publication of EDWIN CLARK'S work on the Britannia Bridge as evidence to support the assertion. That structure soon became as obsolete as one of the pyramids. A bridge or beam with a continuous web seemed to be no more than a makeshift to provide against contingencies. It was an admission of the certainty of strains, but as no one could tell in what direction they operated, the only way to insure safety was to provide as much material as possible where they could operate. BRUNEL, with his customary daring, erected a sort of truss bridge which still serves its purpose, but as his reputation for economical construction was on the wane, his Chepstow Bridge was not accepted as the germ of a new system. It was considered that something could be gained by substituting a lattice for a solid web, and an effort was also made to reduce expense by employing cast-iron along with wrought-iron. The Americans were, however, compelled to practise a more rigid sort of economy, and they were as little able to afford to span their valleys with English lattice bridges as with bridges of the type of STEPHENSON'S Victoria Bridge across the St. Lawrence. They deserve the credit for first introducing truss bridges on a grand scale and for showing their fitness to carry railways over rivers and chasms where construction of any kind might be supposed to be an impossibility. Mr. RUSKIN at one time sneered at railways by saying that by their aid man was only emulating the gnat; if he could have seen some of the American bridges he might have added that they were mere imitations of the spider's web.

The truss bridge, having demonstrated that it was both safe and economical, began to exercise a sort of fascination over engineers. Bow, of Edinburgh, devised a couple of hundreds of varieties of bracing, which to many of the old school were no more than exercises of imagination; but they were soon surpassed in number and complexity in America. Every new firm of bridge-makers was expected to have its own special systems, and as the country was wide there was room for them all. An impetus was therefore given to the study of principles, and in consequence an immense number of books made their appearance.

Some centuries hence philosophers will probably be found who will be able to demonstrate that the truss bridge is as representative of the end of the nineteenth century as any of the old French and English cathedrals were of the Middle Ages. It is the type of utilitarianism—or shall we say of state socialism? Every part has its function, and cannot help performing it. There are no superfluities, for material is not employed for the sake of appearance. A margin of strength has to be allowed—or rather is insisted on by public authorities; but it is solely on the understanding that contingencies may arise when that material must exert itself. There is no concession to conventionalism. People who have derived their notions of construction from antiquated examples wonder why iron and steel bridges are not ornamental. With as much reason they might object to mathematical and chemical formula, because there is nothing rhetorical or impassioned about them. As long as the bridges are severely scientific they have a character which demands respect. When an effort is made to transform them into something else they become despicable. Every Londoner who passes under the railway bridge across Ludgate Hill receives a lesson about the absurdity of an endeavour to make an iron bridge ornamental, and in other places more repelling examples are to be found.

It is an advantage in Professor WARREN'S book that he does not attempt to delude a student by suggesting that construction in iron, steel and timber can be made to vie with construction in stone for architectural effect. When he refers to stone, brick or concrete, it is about the capacity to resist stresses and similar problems. The book was, we suppose, primarily intended for colonial students who

cannot at all times have a supply of drawings at hand, and therefore care has been taken to give ample descriptions of a great many structures. The author says:—"The special feature of the work lies in the various examples which illustrate the design of the most important classes of structures in iron, steel and timber; these have all been selected from existing works. The author's experience in teaching has convinced him of the necessity of thoroughly illustrating the various principles underlying the theory and practice of construction, and the student is never certain whether he understands these principles or not until he has attempted to apply them."

The colonial origin of the book is also suggested by the appropriation of a part to construction in timber. That is interesting, because timber trusses are of ancient date, although they may not have inspired the employment of steel. But the pages also reveal in a brief form the advantages possessed by the Australians in having stronger timber than is available in other parts of the world. Professor WARREN says he has tested the tensile strength of nearly all the varieties of Australian timber. He found that while red pine and spruce had a tensile strength of about 10,000 lbs. per square inch, most of the Australian timber exceeded 20,000 lbs. per square inch. The compressive strength was no less remarkable, but it is observed that "Australian timber is liable to decay at the heart and form a pipe, the area of which must be deducted from the area of the log in calculating the strength." The shearing strength of Australian timber is much in excess of any that is found in America. Professor WARREN says that "the strength and durability of Australian timber are greater for winter than for summer felled timber, and the strength is greater in seasoned than in unseasoned timber; but experiments prove that natural seasoning is better than either kiln-drying or steaming. The average life of timber bridges in Australia is about 25 years."

The observations on timber which we have copied are suggestive of the character of the book. It deals with "Engineering Construction." A great part of it treats about strains, elasticity, moments of resistance, and the like, in the abstract, but only as subservient to construction. The practical information is not of the stereotyped kind. The difficulties which the Australian engineer has to encounter and overcome are not unlike those which arose before now in America, and accordingly Professor WARREN gives as much attention to what has been accomplished in the States as he does to English practice. His book, in consequence, has a sort of freshness which is welcome to the student of engineering literature in this country. The information given is sometimes curious, especially when it relates to particulars which are passed over in English treatises. For instance, we are told that "experiments made by the United States Government show that smooth rods have a greater holding power than ragged ones; that the resistance ten months after being driven is 10 per cent. greater than the resistance immediately after driving; that round drift bolts are 25 per cent. more efficient per pound of metal than square ones." A more exact notion of the author's method of treatment may be derived from the following passage in the chapter on "Wind Pressure":—

The British Board of Trade rules require that bridges in exposed situations should be calculated for 56 lbs. per square foot, and this pressure is to be considered to act over twice the area exposed by the girder, the resistance to be provided by the dead weight of the structure. In the present state of our knowledge of wind pressures on structures, it is only possible to estimate roughly the loads which may be expected. The experiments of Sir B. Baker, although probably the most valuable for our purpose, require to be extended considerably before the wind loads on structures can be estimated as accurately as the ordinary live or dead loads. The importance of the subject in connection with the design of large structures may be realised by a consideration of Sir B. Baker's estimate of the stresses in the Forth Bridge, which are as follows:—

Stresses due to dead load	2,228 tons
" " live "	1,022 "
" " wind "	2,920 "

The pressures deduced from anemometer experiments are for an instant only, and do not represent the pressure at the same instant over a large structure such as a bridge, the maximum pressures being due to gusts in advance on the main body of the moving mass of air. It is known, however, that the velocity of the wind is greater the higher the surface exposed is from the ground, and Rankine has deduced the greatest average pressure which could be realised on tall chimneys as 55 lbs. per square foot. By calculating the overturning moment of

* *Engineering Construction in Iron, Steel and Timber.* By W. H. Warren Challis, Professor of Civil and Mechanical Engineering, University of Sydney. Longmans, Green & Co.

railway carriages and trucks, it is clear that the average wind pressure on the surface exposed in such cases but rarely exceeds 30 lbs. per square foot, as only in very exposed situations, and under exceptionally strong winds, have railway vehicles been overturned. Since 30 lbs. would overturn most of the rolling-stock on existing railways, it is not necessary to estimate a greater pressure on the exposed surfaces of a bridge and train, although a greater pressure may be allowed on the bridge itself without the train. The correct estimate of the exposed surface is very important, and the amount of shelter afforded by the truss on the wind side to the truss on the lee side. As the pressure of wind on structures which rise a considerable distance above the ground is greater in proportion to the height above the ground, tall chimneys, piers of viaducts, Eiffel towers, &c., may be calculated for from 50 to 56 lbs. per square foot of exposed surface for heights above 100 feet; the first 100 feet may be calculated for 40 lbs. In a circular chimney the surface exposed is equivalent to a flat surface, the width of which is half the diameter of the chimney. In braced piers, towers and bridges, in order to allow for the effect of the wind on the lee side, the area on the exposed side should be multiplied by two. The American practice in estimating the force of wind over bridges is as follows:—The train surface is taken as 10 square feet for every foot in length, and the pressure of wind at 30 lbs. per square foot, or 300 lbs. per lineal foot of train, which must be added to the exposed area of the truss in square feet multiplied by 30 lbs. The former is treated as a moving load and the latter as a fixed load. The bridge is also calculated for the case when the train is not on the bridge by multiplying the exposed surface by 50 lbs. per square foot. The maximum stresses produced by either method of loading are used for designing the wind bracing.

Professor WARREN deals with all the structures of iron, steel and timber which are commonly designed by civil engineers. As he treats questions of strength by calculation as well as by graphics, the book will not only help in preparing designs, but shows how one process can be made to verify another. In new countries and in districts which are remote from libraries the advantages of the author's treatment will be felt by young engineers. For those who have not been able to obtain systematic instruction in the principles of design, or for students who are desirous to supplement the lessons of the classroom, the volume will be found an efficient aid. It is to be hoped the author will soon be enabled to bring out the companion volume, which will treat of brickwork, masonry and concrete.

HORSHAM PARISH CHURCH.*

IN common with several of the surrounding parishes, no mention is made in Domesday Book of any church existing when that work was compiled, and the first record of the existence of a church at Horsham occurs in 1229, when John de Braose conferred the impropriation on the prioress and nuns of the priory at Ruspur, an adjacent convent then recently founded. The charter of endowment on this occasion was granted by Ralph Neville, Bishop of Chichester, in 1231, and confirmed by his successor, Stephen Berkstead, in 1281. The deed above mentioned shows clearly that either an edifice of some importance was then in existence, or immediately contemplated, as it provides that the vicar should have "one chaplain as his assistant and two subordinate ministers, namely, a deacon and subdeacon, to officiate with him in the same church." In fact, the town of Horsham had attained some importance at the close of the thirteenth century, at which period we meet with the first record of the return of a member of Parliament for the borough. The donation ordains that the prioress and nuns should receive the whole tithes of corn, &c., and the vicar the small tithes and the altar offerings. Mention is made of the benefice in the accounts of the taxation of Pope Nicholas in 1291. In 1307 the Trinity Chapel on the north side of the nave was founded by Walter Burgess, and in 1341 the Nona Roll, which includes Sussex, but not Kent or Surrey, gives the worth of the living as being of the total sum of 13*l.* 6*s.* 8*d.*, or twenty marks; this return was made on the oaths of four of the leading parishioners. In 1447 license was given to found a chantry, afterwards called "Butler's Chantry," at the altar of St. Nicholas, which Mr. Cooper says was in the northern aisle of the chancel, finally called Roughtey Chantry. He adds that the chantry priest's house was sold in 1550 to Edward Sucknor. There is still a house near the churchyard called the chantry house, and it probably replaces the one above referred to.

A brotherhood or guild was formed in 1457 by several inhabitants of Horsham, among whom we find the names of Agate, Lintott, Mitchell, Potter and Waller, all names still well-known and respected in our town, after a period of more than four hundred years. The guild was dedicated to St. John Baptist and St. Anne, and masses were said for the welfare of

the members at the altar of the former saint, who was extremely popular in the Middle Ages. The fraternity had somewhat of the nature of a modern benefit society, and possessed two houses inhabited by poor persons rent free. Mention is made in 1548 of the brotherhood house in North Street, and at the same date the guild held a croft in South Street, which probably gave the name of Tanbridge to the spot now so called in the Worthing Road, as St. Anne, corruptly known as "Tan," was the patroness of the society. Doubtless, as in other guilds and companies, there were convivial meetings of the members, as we find that in 1521 Richard Nutley, of Horsham, bequeathed a nine-gallon brass pot to the brotherhood of St. John and St. Anne. Similar guilds existed in Sussex at Chichester, Donnington, East Bourne, East Grinstead, Pagham and Steyning.

In 1534, at the dissolution of Ruspur Priory, the rectorial tithes were leased to Thomas Thurley and Thomas Mitchell for sixty years; at the end of the term they passed to Robert Southwell and his wife Margaret. James I. conferred them on Mr. Bostock, of East Grinstead; they then passed through the hands of the Wicker and Broughton families, and finally into those of the Hursts, with whom the rectorial rights now remain. At the suppression of Ruspur Priory the patronage of the vicarage was granted to the Archbishop of Canterbury, whose successors have held it ever since. The troubles of the sixteenth century appear to have affected the ecclesiastical history of Horsham Church in a very slight manner. But in the seventeenth the Puritan party dispossessed the vicar, and appointed a Mr. Chatfield their lecturer, as we are informed in Miss Hurst's "History of Horsham," though one esteemed member, Mr. Phillips, calls my attention to certain marks on the west front of the tower, which are traditionally said to have been made by the Cromwellians, and he also informs me that similar holes are to be found on the tower at Hailsham, and are likewise attributed to the Republicans of the seventeenth century.

Having presented my hearers with a concise history of the ecclesiastical events connected with our church, a few remarks may be made on the history of the fabric itself. I think there can be little doubt that a church of some importance existed in Norman times, but of this edifice we have no records left. In the thirteenth century the present nave, aisles and chancel were erected; in the fourteenth the north porch and chapel; whilst the fifteenth and the early part of the sixteenth centuries saw the erection of the south chapel and the two-storeyed vestry. No alteration in the fabric of the church took place until the year 1864, when, extensive repairs being necessary, they were not only taken in hand, but important additions and alterations were made. The plan before us shows the church as it existed previous to the above date. Of the church which was here before the almost total rebuilding in the thirteenth century we have only the lower part of the tower left us, and a doorway which has been shifted from its original position in the north aisle in 1864, and a small Norman lancet, which is, perhaps, an old one. It has been said that Norman towers were nearly always central; that is to say, placed between the nave and chancel. This is quite an unsupported assertion. Not only is the tower of Horsham a western one, but we have several undoubted Norman western towers in Sussex, as at Feltham and Seaford. It will be noted that the tower stands south of the present nave, and not in the centre of the west wall. This shows the greater age of the tower and that the former nave was narrower by about 3 feet than the present one. The reason for this statement is that when a nave was widened or an aisle or chapel added, it was usual in the Middle Ages to take the additional space required from the ground north of the church, and not from that south of the edifice, where the graves of the departed chiefly lay. The repugnance against being buried on the north side of a church is well known, and is, I believe, still strong in many places, especially, I am told, in Warwickshire, and an old print of Horsham Church shows very few graves north of the building. The tower arch appears to have Norman jambs, over which an Early English arch has been awkwardly placed, and the plain character of the upper part of the campanile would indicate that it is of a date anterior to the noble nave and chancel. The lofty shingled spire is one among many such in Sussex, and there are two in the immediate vicinity—at Billingshurst and Wisborough Green. The west lancet is modern. The nave of our church is supposed to have been erected at the expense of the parishioners, the chancel at that of the nuns of Ruspur, the result being the very beautiful church in which we are assembled.

The plan presents some remarkable features, of which perhaps the most striking is the omission of the chancel arch and of the cross arches of the chapels. This omission is seldom met with before the fourteenth century, at which period we have an example at Fratton. The continuation of the aisles to the extreme east end is rare in parish churches of the thirteenth-century date, but is seen at Eastbourne. Lastly, the continuous clerestory is a noteworthy feature in an early Pointed parish church not cruciform. The architect, it will be seen, depended entirely on beauty of proportion for the success

* A paper read by Mr. J. Lewis André, F.S.A., at the annual meeting of the Sussex Archaeological Society.

of his design, as here we have a simplicity of conception worthy of a Cistercian abbey in the plainness of its details. Here are no marble shafts, no rich mouldings, no floriated capitals, and yet the effect of the whole produces an impression of great dignity, and in no way suggestive of parsimony in outlay or poverty in design. In planning the chancel a geometrical proportion has been followed, as the space between each pier is equal to half the width of the choir; this is not observed in the nave except in the easternmost bay. The nave arches have no labels over them in the body of the church, but those in the chancel have them, with peculiar little heads at the points of the labels. The chancel clerestory lancets are also slightly richer externally than those of the nave. The bases of the nave have carvings at their junctions, with their square plinths, as at Donnington, but those appear to be modern. At the east end there was originally a triplet of lancets, of which fragments were found in 1864. The lancets now in the outer walls are either entirely modern or restored from indications discovered at the same date. Externally we see two pinnacled turrets at the east end of the clerestory. These were not entirely ornamental adjuncts, but designed to counteract the thrust of the arcades. Although there were the northern entrances to the north side of the church, there appear to have been none in the south, a peculiarity found in several Sussex examples, as at Clayton, Framfield and Ifield. Early in the fourteenth century two coupled two-light windows were placed in the north wall, an unusual feature, but of which there still remains an example at Kenilworth, Warwickshire; the one here perished in 1864. Soon after the insertion of this window the large north porch and the chapel connected with it were added; a somewhat similar arrangement of porch and chantry may be noticed at Rye. Here, at Horsham, under the east end of the chapel, was constructed a vaulted chamber, partly above and partly below the ground. There is, I think, little doubt as to its use, namely, as a receptacle for the bones found in the cemetery. There is a like contrivance in the south aisles at Bosham, and some large churches had a building quite apart from the main structure devoted to this purpose, as at Norwich Cathedral and St. Margaret's, King's Lynn. The outer doorway of the porch is ancient, and has by its sides two very singular unglazed lancets, set low down and of no use for lighting, but which appear to me to have been used for confessional purposes. The beautiful chapel windows are correct restorations of the original openings.

About 1350 a three-light window of neat traceried pattern was placed in the south wall and a rood-screen erected, of which more further on. The screen perished in 1826, the window in 1864. In the fifteenth century the eastern lancets of the chancel were displaced to make way for a large Perpendicular window similar in design to the one before us. Other windows were also inserted in the south aisle. Later on, in the same century, the south chapel was built, an addition calling for no special remarks. At the same period, however, the roofs throughout were replaced by others with tie-beams and of waggon-shaped panelling; of these much remain in the present roofing. The cornice to the chancel and the carved bosses, which are in some cases old and in others faithfully copied from the originals, are all worth notice.

The last structural addition was the erection of the two-storeyed vestry north of the church. Vestries of more than one storey are rare, but there is one very similar to this at Hamstead, Hertfordshire. The external doorway is quite modern, all old vestries being entered from the inside of the church only. Like the adjacent churches of Rusper, Shipley and Warnham, Horsham Church was dedicated to the Blessed Virgin Mary, but it is not easy to fix the position of the altars formerly existing. The north chapel was dedicated to the Trinity, and I think the altar of St. Nicholas was at the end of the north aisle of the choir; St. John Baptist appears to have had an altar at the end of the south aisle, and St. Michael one in the south chapel. The piscina of the high, or master altar, as the French term it, remains, but in a much restored state; its position in the east wall was occasioned by the arcades running to the extreme end of the chancel. A plain piscina in the north aisle of the choir was similarly compelled to be in the respond or east column—an unusual position. Trinity Chapel has also a piscina now in the east wall; one in the south chapel also remains. The font is a plain specimen of late fifteenth-century art, and the bowl rests on a modern shaft. I need hardly say it is not in its original place. The rood-screen had openings of trefoil headed arches or circular columns, and had figures of saints painted on its panels and was otherwise richly gilt and embellished. The rood-beam probably rested on the octagonal strips of masonry at the junction of the nave and chancel; a similar arrangement is seen at Great Stamburgh, Essex, the only other example I have met with, though in many cases the rood-beam was quite independent of the screen beneath it, as at Temstead, Norfolk.

In the fifteenth century the walls of the nave were painted with various scriptural scenes. The north wall, which then entirely cut off the Holy Trinity Chapel from the rest of the

church, was covered with a series of incidents in the Passion, whilst the west wall was ornamented with the Annunciation and the Last Supper. These last have been repainted as we now see them, but with little regard to the ancient pictures, which were extremely rude and inartistic, though I trust that Mr. Honeywood exaggerated their faults in the sketches which he made and which I am enabled to exhibit to you. One of the subjects was, I believe, our Lord between SS. Peter and Paul, of which we have an undoubted example at West Meston. If this surmise is correct it is somewhat remarkable, as this symbolical representation is often found in early Christian art, but not so in that of the Middle Ages. The scene of the Last Supper in the old work showed the table-cloth looped up with flowers, a custom I am informed still kept up in Germany at family festivals, such as birthdays and marriages. The decorations of the main roofs are I believe a correct reproduction of the original work, and Dallaway informs us that there was a text in letters a foot long, placed under the cornices, but which had been deliberately destroyed before he wrote. The south chapel roof is likewise decorated in colour, but the vulgar-looking shields at the ends of the hammer-beams are modern, probably replacing busts of angels. None of the ancient stained-glass remains, but a visitation book of Philpot and Owen, made in 1634, gives a list of the coats of arms then to be seen in the large east window and those of the south aisle. There is a remarkable old chest of large size in the upper vestry, and which from its dimensions must have been put together in that apartment. Many of the old pews had panels of coarse Jacobean carving, one or two of which will be found worked up into the present sedilia in the sanctuary. The tower contains eight bells, weighing 23 cwt. 3 qrs. 16 lbs. Three are dated 1752, two 1815, one 1838, and there are two undated. It is interesting to observe that the curfew was daily rung until 1891.

In conclusion a few words must be devoted to the very interesting monuments which still remain here, though unfortunately many perished at the time of the alterations forty years ago. The fine high tomb now on the south side of the chancel justly claims our attention. It commemorates Thomas de Braose, a knight who died on September 2, 1395. He married a lady whose christian name was Margaret, but whose surname does not appear to be known. They had two children, who, sad to say, died in little more than a month after the decease of their father. The widow married twice, and died in 1446. This fine effigy is a good example of military costume, and it is noteworthy that the three adjacent churches of Horsham, Ifield and Horley each possess an excellent knightly monument. The shields round the tomb bear the arms of De Braose, D'Aubeney, Bigod, Clare, Clifford, Molyneux and others. On the floor of the chancel is a mutilated brass effigy of a priest in alb, stole, maniple and cope—a very unusual combination of ecclesiastical vestments, of which there are only two other examples in English monumental brasses, but not unfrequently seen in pictures of the early masters. The brass has the initials "T.C." on the orphrey of the cope, and is supposed to commemorate Thomas Clarke, a vicar here, who died in 1441, and with which date the work corresponds. A figure of a lady will be seen in the vestry. It is a fragment of a brass in memory of Richard Foyes and of his wife Elizabeth; he died on April 22, 1513. The canopied tomb on the north side of the chancel was erected to the memory of Thomas Hoo, half-brother of Thomas Hoo, Lord of Hoo and Hastings, who was an ancestor of the unfortunate Anne Boleyn. The Thomas here commemorated represented the county of Sussex in Parliament in 1446 and 1448 and the borough of Horsham in 1472. He was a staunch Lancastrian, and was employed in some important matters by Henry VI. He died October 8, 1486, and left no issue. The tomb is in the very latest style of Gothic art, and at present bears no inscription. The brass enamelled shields had perished before 1634. There is a tradition that Queen Elizabeth caused this monument to be repaired, which has some probability, as she was related to Thomas Hoo through her mother's family. The flat slab under the canopy, and the position of the tomb, suggest that it may have been also intended as an Easter sepulchre. The very beautiful monument, now placed against the south wall, but formerly standing quite detached, commemorates Mrs. Elizabeth Delves, a daughter of Hall Ravenscroft, Esq., and wife of Thomas Delves, Esq., son and heir-apparent to Sir Henry Delves, of Dodington, Cheshire, Baronet, the baronetcy being now extinct. Mrs. Delves died December 2, 1654, about twenty-five years of age. Dallaway states that the beautiful recumbent effigy is a "work of Francis Fanelli, one of the most celebrated sculptors of his day." The same author records monuments for members of the Eversfield, Gresham, Mitchell, Tredcroft and many other families, in all thirty-nine in number, many of which have now disappeared. Among the memorials was one of Sir Bysshe Shelley, Bart., who died January 6, 1815, aged eighty-three, and other slabs, one for his wife, Mary Catherine, and another for Catherine, their daughter. A plain slab has been fixed recently in the tower to com-

memorate the poet Shelley, who was born in the adjacent village of Warnham. Dallaway records twenty-nine other memorials besides those named above, and most of which have entirely perished. A helmet and crest will be found at the east end of the south chapel.

FLINT IMPLEMENTS IN NORTH KENT.

AN important discussion took place at the meeting of the British Association at Oxford, in which the sections of anthropology and geology combined for the occasion, concerning the plateau flint implements in North Kent.

Professor T. Rupert Jones, F.R.S., said the subject had been fully treated by Professor Prestwich in memoirs which elucidated the general geology of the local drift-deposits, the geological stages of their formation, and the peculiar flint implements of the plateau. He has shown that certain superficial soils on the North Downs between Sevenoaks and Rochester contain numerous rudely worked flints, discovered by Mr. B. Harrison; and that these were derived from a gravel of very great antiquity, originally formed on the side of the old Wealden Hill range or mountain, which once rose about 3,000 feet above where Crowborough and other hills in Sussex now are. Man existed at the time of these gravels, and used the flints for tools. These gravels and the implements left in them were removed by natural agencies, such as rain, rivers, sea, frost and ice, and distributed by torrential streams on the chalk slopes (now part of the North Downs) at a lower level on the flanks of the range. These rude old flint implements have an ochreous colouring, due to ferruginous gravel whence they came, and are now found on the plateau, sometimes with limited patches of some of the ochreous flint gravel, together with tertiary pebbles, less-worn flints, and fragments of lower greensand, on the red "clay-with-flints" covering the chalk. It is shown how desirable systematic excavations, to prove the extent and thickness of the implementiferous soil, would be. Professor Prestwich's history of the origin of the ancient Wealden dome, island and hill ranges, and of the gradual destruction of those uplands in the course of untold ages, with the resulting formation and removal of successive geological groups of strata, such as the Thanet sands, Woolwich and Reading beds, London clay, Lenham beds, and the old ferruginous gravel with its rude implements above mentioned, are noticed in detail. The Diestian or Lenham beds were formed in the early pliocene period, and the denudation of Holmesdale probably began directly afterwards, at about the time of the red or the Chillesford crag, in lake-pliocene or in post-pliocene times; and the old ferruginous gravel had not only been formed, but washed away to a lower level before that time. The ultimate denudation of the valley cutting off the chalk from the Weald being subsequent to the formation and removal of that gravel, the latter must have been pre-glacial in age.

Mr. Whitaker said that the flints exhibited might be divided into two classes, the few that would be allowed by every qualified observer to be the work of man, and the many as to the authenticity of which judgment should be deferred. He then alluded to the two points of view from which the subject was approached—the anthropological and the geological. In the former the work of man was the starting-point; but, as a geologist, he thought that nature should be duly considered, and the varied way in which she worked, sometimes leading to results that were somewhat unexpected. The district in question, too, was of a double character. In the first place, we had to do with a tract, south of the chalk range, over which there were in parts beds of gravel, sometimes along the courses of the stream valleys, but sometimes having no connection with the present drainage system. In the latter case the composition and position of the gravel seemed to point to a time when the features of the country were not the same as now, when the streams ran in different courses, and when the chalk escarpment, and other similar ranges of hill, reached further south than now. He pointed out that the district was at and near the watershed between the Medway and the Darent, and that in such a position alterations in the flow of streams could be brought about by smaller causes than lower down along the river valleys. The other part of the district was along and north of the great chalk range, and the deposit here mostly met with over the chalk could not properly be called drift; it had not been brought into its present position from elsewhere, by sea, river, or ice, but had grown where it stood; it was a residuum, the matter left from long-continued gradual dissolution of the chalk and the leaving behind of its flints and other insoluble matter, to which was added a mass of loam, resulting presumably from the remains of old tertiary beds. With regard to the gravels, flint implements of undoubted workmanship having been found in them, it must be conceded that man existed at the time of the deposition of those gravels. This certainly carried man back locally at all events beyond the time of the river gravels, which occur in the bottoms and

along the slopes of the valleys. He could not admit, however, that there was any good evidence to connect these ancient men with pre-glacial or even with glacial times, as there were no deposits of undoubted glacial age in or near the district. Over the clay-with-flints of the chalk tract many implements had been found, but these were on the surface, and therefore we had no evidence of their age other than that given by their form. He understood that it had been said that a very few implements had been found in the clay; but even were it so we should be little wiser as to their age, the formation of the said clay having continued over a long time right down to the present day. Elsewhere implements had been found in a brick-earth that was associated with the clay-with-flints; but in this case we were still ignorant of the age of the deposit, no other bed having been found above. He thought that in such a matter great caution was needed lest observers should be carried away by their zeal in discovery, and that the right spirit was to approach the question with wholesome doubt, contesting the views of those whose faith led them to believe very ordinary looking chippings to be the work of design, so that they should have to prove that the balance of probabilities was in favour of their view.

Mr. Montgomerie Bell confined his remarks to the anthropological part of the question, and proceeded to give reasons why the collections of flints from the plateau-gravels showed evidence of human handiwork. He produced implements with a hollow curve in the side, which are found in all successive periods of flint-using man, and were used for rounding pieces of wood or bone. Why the type from the plateau-gravel should be rejected because the flint did not possess other qualifications, he could not see. He next pointed out how some flints were worked symmetrically all round, and asked how nature could work in such a way. The real point was not whether some particular and well-known style of working flint was present, but whether order, regularity and purpose were visible in the working, for these were the traces of reasoning and of man. Next, the points of similarity between the primitive and common river-valley type were touched upon, the same shapes, the same curves, the same flaking were to be seen, although in ruder forms. His final conclusion was that all the evidence pointed to the working of a race of men with strongly-developed body but weakly-developed mind, and that this was exactly the conclusion which we should expect to find. The actual geological date of these drifts seemed to him unimportant, though, in his opinion, they belonged to pre-glacial or pliocene time. The great dispersion of man in quaternary times made his pre-existence a logical necessity; to find his actual relics here or there was no doubt an additional satisfaction, and, considering what that lapse of time meant, and that even flint was worn by time, we should not expect the relics of such an age to be in themselves artistic or their material to be in a brand-new and easily recognisable condition.

Sir John Evans inquired whether implements of the ordinary palæolithic type had not been found in the plateau deposits, and was answered in the affirmative. Agreeing in the main with the statement as to the geological features of the case, he pointed out that any intervention of a glacial period, as suggested by Professor Rupert Jones, was inadmissible, while the evidence as to the palæolithic age in Suffolk being locally post-glacial was irrefragable. The principal outcome of the recent discoveries was, to his mind, the fact that the existence of palæolithic man could be carried further back in time than the valley gravels, inasmuch as they are now found in gravels on the plateaux at far higher levels. He could not regard Kent as the cradle of the human race, nor care to trace the development of its stone implements from flints of natural forms. The endeavours to enlarge the catalogue of implements in use in palæolithic times he regarded as praiseworthy, but any inference drawn as to the co-existence of two races of men in Kent in those early times seemed to him absolutely unfounded.

Dr. H. Hicks said he had much pleasure in supporting the views of Professor Prestwich. In following Sir J. Evans he was reminded of the many discussions in which they had taken opposite views on the question of pre-glacial or glacial man during the past ten years, and it was a great satisfaction to him to find that Sir John Evans was now prepared to assign a much higher antiquity to man than he had previously been inclined to do. It was well known that until a comparatively few years ago Professor Prestwich had shown much caution in giving man the antiquity that he now did, and he had stated that he had come to the conclusion largely owing to the researches of Mr. Tiddeman in the Yorkshire caves and to those which he himself had carried on in the caves of North Wales. Mr. Tiddeman was certainly the first in this country to claim that implements fabricated by man occurred under typical boulder clay. Dr. Hicks said further that for the past ten years he had been collecting evidence in the South of England to see whether there were any facts available which would be of service in showing that man occupied that area in glacial or in pre-glacial times, and he was perfectly satisfied, from

evidence which he had personally obtained from the gravels on the South Downs and also from the Hertfordshire hills, that man had occupied that area before the close of the glacial period. Evidence, which he would refer to more fully in another section, had been recently obtained which proved that flint implements containing very distinct evidence of having been worked by man occurred also in the subangular gravel underlying the chalky boulder clay at Whetstone, Finchley and Hendon.

Professor Boyd Dawkins pointed out that the question before the meeting was not the evolution of palæolithic culture of the human race, but the age of the high plateau-gravels, in which and on which flint implements are met with. In the course of the debate it had been amply proved that these deposits are not of such high geological antiquity as to be out of the range of the palæolithic period, the characteristic implements of which occur on and below the surface. The argument that the ruder implements are older than the higher types found along with them was negated by the repeated discoveries of all the forms in question in the same deposits in caverns underneath the stalagmite, such as those of Cresswell. He agreed with the views of Sir John Evans as to the implements, and with Mr. Whitaker as to the geology. In his opinion neither wear nor stain is of importance in fixing age; they are merely local accidents. He was unable to take the existence of man in North Wales and in the area of London in pre-glacial times as otherwise than non-proven, and he knew of no proof of pre-glacial man in any part of the world.

General Pitt-Rivers said that he did not think the authors of this ingenious idea had added much towards proving their position since the subject was brought before the Anthropological Institute some short time ago. He was quite of opinion that some ruder implements than the tongue-shaped flints of the drift must have been used by earlier races of men which had led up to them, and, on the other hand, he had, some twenty-five years ago, published a diagram in which he ventured to show that many connecting links could be found between these tongue-shaped implements and the neolithic flint celt of the surface period. But he did not think the majority of the stones exhibited were of artificial fabrication; some of them were, but not all. He disagreed with one of the speakers in thinking that a single bulb of percussion was sufficient to prove human workmanship. The bulb of percussion on a facet shows the direction in which the blow was given, but any hard knock would produce it. What was wanted to prove design was to have two or three blows at least given in the same or some definite direction, so as to show continuous evidence of design on the part of the fabricator. He thought that the hollow scrapers exhibited might have been formed by taking up a sharp-edged flint and scraping a round substance or stick with it. The flint in this process flakes off so as to form sharp edges and facets in a concave shape, exactly as if they were purposely formed. He thought the geological evidence was more or less shaky, but on that subject the opinion of so many experienced geologists had already been given, and he would not therefore occupy the attention of the meeting upon that point.

Sir Henry Howorth said there are only two geological barometers which are trustworthy—superposition and the presence or absence of certain extinct or domesticated animals. In the absence of these criteria it is most unsafe to discriminate between the different classes of stone implements and especially to attach any special age to surface finds. The only evidence available for testing the relative age of the plateaux-gravels goes to show what Dr. Hicks and himself had fought for years, namely, that they are older than the distribution of the so-called glacial drift. The gravels are of two kinds—one water-worn and round, the other angular. The pebbles of the rounded gravel are probably due to the disintegration of much older beds of tertiary or secondary age. The trituration of the stones in these gravels and their distribution belong to two different stages of the problem. This distribution, like the distribution of the angular drift (which has to be explained on the other side of the Channel as well as on this), cannot be explained by any subaerial decay of the surface or by any fluvial agency, since surface disintegration cannot explain the formation of these angular flints, nor can rivers explain the spread of the gravels which occur continuously in unbroken sheets in an undulating country. They mantle the surface irrespective of its drainage in a wide district where there is no gathering ground for large rivers. The facts, as Mr. Flower and Professor Prestwich have strongly urged, are only consistent with the implement-bearing gravels of the plateaux having been distributed by a widespread diluvial force, and with their belonging to a horizon underlying the so-called glacial drift.

Mr. Clement Reid questioned the extreme antiquity of the implements, pointing out that careful search had led to no discoveries in undoubted pliocene and pre-glacial deposits.

Colonel H. H. Godwin thought the chopping of the ruder forms might be due under cold conditions to what he had seen

himself on the steep ice slopes in the larger glaciers of the Himalayas. Capping these cliffs are thick accumulations of more or less subangular gravel. During the night stones get frozen into the crevices of the face of the ice; as soon as the temperature rises showers of stones fall down the slopes often 40 feet and 50 feet, and are quite capable of striking off flakes on the edges of the fixed stones. This example might be carried to the slopes of frozen mud and gravel on the sides or vicinity of the ice.

TESSERÆ.

The Romans in Art.

THE architectural achievements of the Romans deserve the greatest admiration. The Greeks have the boast of having formed their temple from an idea so that everything was in keeping, but the Romans, although they did not invent new forms, had the wit to develop and combine existing forms so as to supply appropriately the demands of an Imperial city, the capital of the world. They managed to solve the discord between columns and arches and used them together. The taste of the Romans was not so delicate as that of the Greeks, who always managed to hit the happy mean between too much simplicity and over-elaboration; the Romans pile on all sorts of ornament to increase the effect, but they surpass the Greeks in their management of large spaces, for their buildings were practically unlimited in size, and became models for imitation owing to the ingenuity of the grouping together of large and small rooms, so that each should be in the right place and serve its purpose, and yet be subordinate to the effect of the whole. A great architect and archaeologist has said that the art of building in Imperial Rome was the art of ruling the world expressed in stone. In sculpture the Romans achieved very much less; indeed they hardly played any independent part in it except in portraits and historical scenes, and in this narrow field they remained under Greek influence, so that their efforts exhibit grace and even beauty as well as truth to nature. They certainly, however, have the merit of having provided a place of refuge for Greek artists when the earlier order of things was destroyed; and when they stole treasures from Greek cities to bring to Rome they were thereby the means of preserving them for a long time from destruction. Most of the Greek originals were lost in the storms of the Middle Ages, but innumerable imitations had been made by artists of technical excellence, so that Rome shone in a sort of reflected lustre of Greek beauty, which, before the Greek soil began to yield up some of the treasures concealed in its depths to modern investigators, had more than once raised and ennobled the debased taste of the civilised world.

Monge and Descriptive Geometry.

The father of the great mathematician was an innkeeper, who was described by Madame Roland as a "maçon parvenu." At fifteen he went to the college of Lyon to study natural philosophy, and in the following year he was employed to teach it. Afterwards he obtained an appointment as teacher in the military college at Mezières, where he remained till 1780, when he was appointed professor-adjoint with Bossut, in teaching hydrodynamics at the Louvre. During his stay at Mezières, observing that all the operations connected with the construction of plans of fortification were conducted by long arithmetical processes, he substituted a geometrical method, which the commandant at first refused even to look at, so short was the time in which it could be practised. It was, however, received with avidity when further inspected, and Monge, continuing his investigations, soon generalised the methods employed into that great alphabet of the application of geometry to the arts which is now called descriptive geometry. Such, however, was the system of the French schools before the Revolution, that the officers who had been trained in this application were strictly forbidden to communicate its methods even to those who were engaged in other branches of the public service. Monge himself, in 1780, conversing with his pupils Lacroix and Gayvernon, was obliged to say, "All that I have here done by calculation I could have done with the ruler and compass; but I am not allowed to reveal these secrets to you." But Lacroix set himself to examine how this could be, detected the processes employed, and published them in 1795, under the title of "Compléments de Géométrie." The method was published by Monge himself, first in the form in which the shorthand writers took them down from the instructions given at the Normal School, also in the collected edition of the "Leçons de l'Ecole Normale," 1800; and finally in the well-known work "Géométrie Descriptive (fourth edition, 1820), which, in simplicity, style and choice of details in a subject which might easily have been overloaded with them, stands second to no elementary work whatever. The methods of descriptive geometry recalled the attention of geometers to the properties of projections in general, of which such only had been particularly noticed as could be applied in the arts of design or in the investigation of

primary properties of the conic sections. From the time of Monge to the present this subject has been cultivated with a vigour which has produced most remarkable results, and promises more. Pure geometry has made no advance since the time of the Greeks, which gives greater help to its means of invention than that which the labours of the school of Monge have effected.

Centring for Groins.

It is obvious that in forming the ribs for each vault the outer curve must be the arc of a circle or ellipsis within the curve of the vault, and distanced from it towards the axis equal to the thickness of the boarding. In making the groined centre, it will be necessary to find the place of the angles on the boarding of the large vault, in order to ascertain the place of the ribs and boarding of the transverse vault. This may be done by three different methods. First, let two straight edges be placed vertically at the angles, and a third straight edge, or an extended line, be made to touch the surface of the boarding, and marked at all the points of contact, keeping the latter straight edge or line always upon the edges of the two vertical straight edges. The defect of this method is, that the place of the angles at the bottom can never be found, since it would require the cross straight edge or line to be of infinite length, and the vertical ones of infinite height. A more eligible method, therefore, where there is room, is, secondly, to fix two ribs in the transverse part, and direct a level straight edge upon their edges, so that the end may come in contact with the boards, and mark the boarding in this place; find a sufficient number of points for the purpose, in the same manner, and draw curves through the points, which will give the curves for fixing the end of the filling-in ribs, otherwise called jack-ribs. In constructing groins to be finished with plaster the angle-ribs must be first fixed, then straight longitudinal pieces parallel to the axis of the groin fixed, either flush with the under side of the angle-ribs, or their under sides a little below those of the angle-ribs, so as to admit of their being nailed together; this is the most eligible method of constructing plaster groins.

The Chinese as Colourists.

With respect to colour the instinctive art of the Chinese is instructive and admirable. They are colourists of remarkable skill, though in this surpassed, as in some other points of art, by the Japanese, also a Mongolian race. Colour as used by these nations is unlike anything else in the world. We hear it called Oriental—that broad and convenient word—but it is not the Orientalism of India, even of Burma, not of Persia, Arabia, or of Turkey, as we now see it. The chief characteristic of Chinese colour is its dependence on the secondaries and tertiaries, and in the use of some of these as pale green, pink and a broken blue, they are unsurpassed by any ornamentalists. They understand the application of the most vivid red, yellow and the brightest white, but in very small quantities in proportion to the broken colours, which give the peculiar character to their work; their skill is so great that by the magic of colour they succeed in harmonising the discordant elements of form which intrude into their compositions and conceal errors or failures that would otherwise be fatal. In considerable surfaces of one tone their management of colour is admirable. The senseless uniformity of hue which mars the effect of many a piece of Sèvres is skilfully avoided by the Chinese potter; his colour on a vase deepens and ripens in parts as the sunny side of an apple or cherry, and it palpitates as do the hues of nature. This true source of effect is at length known to and sought to be realised by some of our potters and by the French. It does not seem to have reached Dresden, and those who are acquainted with the cold opacity of tone which marks so much German porcelain, will agree that the sooner this law of colour is understood among Saxon potters the better for Dresden.

Muriatic Gas as a Disinfectant.

About 1773, Guyton de Morveau, the French chemist, achieved the important discovery of the means of destroying infection by acid vapours, and of all his labours it is this for which his name will be transmitted to posterity with those of the benefactors of mankind. In one of the churches of Dijon a practice had prevailed of burying the dead in considerable numbers within its walls; this proceeding occasioned an infectious exhalation which brought on a malignant disorder, to the great alarm of the inhabitants of the city. When other attempts to remedy this evil had failed, it occurred to Morveau that the vapours of muriatic acid might be successfully employed to remove it. With this view he made a mixture of sulphuric acid and common salt in wide-mouthed vessels, which were placed upon chafing-dishes and in different parts of the edifice; after closing the windows and doors for twenty-four hours and then suffering the air freely to pervade the building, no remains of the fetid smell were perceptible, and the church was cleared from infection. The same process was tried on other occasions, and the practice was afterwards continued

with the improvement of substituting chlorine gas for muriatic or hydrochloric acid gas. Although this was probably the first employment of muriatic acid gas as a disinfectant on a large scale and with results so striking as those detailed, it appears nevertheless that Dr. Johnstone of Worcester had recommended the use of the same gas for this purpose in the year 1756; it is even stated that he employed it in the prison of Worcester, but no evidence exists of his having published an account of his process before the appearance of Morveau's tract on the subject.

Mediæval Treatment of History.

In the painter's treatment of his subject he has to consider the local scenery of the action, the costume and the national character of the actors, and to determine not merely what these were, but how best he may make them tell on the feelings of his spectators. This would appear very easy of solution, but it is not really so. The mosaic of the battle of Arbela, found in Pompeii, shows that local scenery was at least considered, and that the costume and individual characteristics both of Greeks and Persians were carefully attended to in that work, and our offhand decision would be that in all cases these should be strictly adhered to. It must, however, be recollected that the original from which this work was taken was most probably executed at or near the time of the occurrence, or at least while the peoples and nationalities represented were in actual existence, and when it would have been perhaps as great an outrage on the common sense of the spectator to do otherwise than treat them literally as it would be for an artist of our own day to paint the taking of Magdala and represent the English general and his forces either naked or in a classic costume. Yet even this treatment, when set aside by Benjamin West in his picture of *The Death of Wolfe* in favour of a more literal one, was considered a great error in judgment on his part—an error which only his success justified. Then the question is widely different when the incident or action took place in times long past, and when the ideas of the general public, to whom the painter has to appeal, are either quite unsettled or, it may be, wholly at variance with the literal truth. Thus, when art revived in Italy in the Middle Ages and was patronised by the Church in the interests of religion, the knowledge of the East and of its people was very limited, and the painters treated Scripture subjects with the costume and accessories of their own time. This is seen on the fresco in the Campo Santa of *The History of Joseph*; it is not the sandy plains of the delta of the Nile, nor the massive palaces of Egypt that compose the background, but the lighter architecture and hilly scenery by which the painter was surrounded; while the tabard coats, the tight hose and the quaint caps of the fifteenth century are the costume of the children of Jacob. The same, with slight variations, are to be seen in *The Life of Moses* and *The Passage of the Red Sea*. Even where in these compositions the dresses are not literal, they certainly have no relation to historical fact. This may have had the effect of bringing such subjects more home to the feelings of the ignorant; there was no attempt to carry them back to a remote age with which they were unacquainted; they saw, as it were, their own people, the great men of their own time (for many of the spectators are no doubt portraits) forming a part of the history and as witnesses of its truth. Whether or not this feeling was really aroused it is difficult to say, but certainly the Mediæval artists most frequently treated the facts of Scripture history wholly different from the manner in which they must have occurred, and in accordance with the habits of their own age and time.

Pompeian Mosaics.

The mosaics at Pompeii are of two sorts; the first has a groundwork of stucco, with a pattern formed of little squares of white marble or sometimes of black, or of both fixed into it. The footway of the streets is generally done in this manner; the white squares are placed diagonally in continued lines at a considerable distance apart, and more appearance of design is produced from this simple arrangement than you could easily conceive; in the houses, where it is executed with more care, the effect is very good, but that composed of black squares is decidedly inferior to that where white alone are employed. The more finished mosaics are composed entirely of small squares, or tesserae, generally black and white, but sometimes also of various colours; the patterns are very fanciful, some of them very good, but among the good there is nothing which has not long been in use in modern times for one sort of ornament or another. These mosaics do not seem very ancient in Pompeii, for wherever one finds them in use among the ancient architecture, they uniformly bury a portion of the lower part of it.

The British Association will meet next year in Ipswich under the presidency of Sir Douglas Galton. For the meeting of 1896 Liverpool has been selected, and it is likely that in 1897 there will be a meeting in Toronto.

NOTES AND COMMENTS.

THE first part of a new work on "The Churches of Shropshire" has been published by Messrs. HOBSON, of Wellington. The descriptions are by Mr. H. S. CRANAGE, M.A., who has obtained the aid of Mr. M. T. HARDING for the photographs and Mr. W. ARTHUR WEBB for the ground plans. The work is to consist of ten parts, and it is intended to be "a history of the actual fabrics of the churches and not in any sense a history of the parishes of the county or of the chief families who have inhabited them." It has been written after careful study of the architecture on the spot. The first part treats of the Hundred of Brimstree. The churches illustrated by photographs are Claverley, Shiffnal, Tong (supposed to be the church where Little NELL of the "Old Curiosity Shop" found her last refuge) and Worfield. Some other churches are described, including St. Mary's, Bridgnorth, a Classic building of which TELFORD, the engineer, was the architect. Mr. CRANAGE has been very careful in his accounts of the buildings, and the order of the description being uniform, reference becomes easy. He is not afraid to condemn the weakness of some modern buildings. The collotype illustrations are beautiful and have a softness that is in keeping with the old masonry. Mr. WEBB's plans are hatched in such a way as to suggest the parts belonging to different periods. Altogether the "Architectural Account" promises to be a most valuable record, and it is likely to incite the production of similar books in other counties. It would be an advantage if Mr. CRANAGE could persuade the clergy to remove the banners, altar decorations, &c., while the churches are photographed. They do not enhance the charm of the architecture, although they may be prized by some simple rustics.

It cannot be said there is any monotony about the "Portfolio Monographs." For the sixth of the series we have "Frederick Walker" by Mr. CLAUDE PHILLIPS, and then comes "Fair Women" by Mr. WILLIAM SHARP. Like their predecessors they are themes which are well adapted for treatment by pen and pencil. WALKER is the LYCIDAS of modern English painting, and pity for his fate balances the admiration for his works. He may have attained as much maturity as became his talent, but it is no less reasonable to suppose that all the works he produced were only preliminary exercises by the aid of which he was attaining power. He was a great experimentalist, yet he could hardly be said to have attained a style. There are drawings by WALKER which if considered apart from the colour may be said to have the fidelity of photographs, while in others there are peasants so idealised they recall Greek heroes. It would also seem from some of his later works as if he thought he was a landscapist rather than a figure-painter. He was susceptible to every sort of influence that could be expressed by art, and it would be hard to say whether any of them would ever exercise supreme control over him. The "Portfolio Monograph" contains many illustrations of his works, and there is not one among them which is not interesting. The plate of *Philip in Church* by itself is worth more than the price of the monograph. Mr. CLAUDE PHILLIPS does not write as an advocate or an apologist, for he is candid in expressing his opinion of WALKER's shortcomings. In "Fair Women," Mr. SHARP is able to indulge in an imaginative sort of treatment of the subject and performs a difficult feat with skill. The illustrations extend from Greco-Roman portraiture to that of our own time, and it is needless to say they justify the title given to the monograph.

ARCHITECTURE is receiving much attention in the Edinburgh Museum of Science and Art. The refreshment-room, which received little patronage, has been utilised for the display of casts. The museum had acquired a large number which had been originally made under the direction of Sir CHARLES BARRY for the use of the stone and wood-carvers employed in the building of the present Houses of Parliament. Many of them had been taken from work in the Lincolnshire and Norfolk churches. But they could not be described and labelled, as the identification was

neglected. That onerous work is now complete, thanks to the curator. Photographs were obtained of the casts, then Norfolk and Lincoln were explored until the original subjects were discovered. Parts of the buildings showing the subjects were also photographed, and the value of the casts is consequently enhanced, for their relation to the surrounding work can be ascertained. The museum has also obtained casts of the Tuam cross, parts of the transept doorways of the cathedrals of Bordeaux and Beauvais, and part of the rood-loft in Limoges Cathedral.

ACCORDING to Sir A. GEIKIE, the Director-General, the original Ordnance 1-inch maps of the centre and south of England, on which the work of the Geological Survey has been engraved and published, were in many cases engraved from inaccurate surveys, and their topography has become, over large parts of the country, so antiquated as to be of little use. They are now entirely superseded by the new series of 1-inch Ordnance maps. The re-surveys for drift and for coal-field purposes now being made by the Geological Survey are conducted upon the latest 6-inch Ordnance sheets. It is found difficult, sometimes indeed impossible, to make a satisfactory reduction of the geological work from these field-maps to the old, inaccurate and antiquated 1-inch maps of the Survey. The expense of alteration of the old plates would be so serious, sometimes involving the entire cancelling of a plate and the preparation of a new one, that on the ground alike of efficiency and of cost it will be desirable and indeed necessary, as the re-survey advances, to cancel the old series and to adopt the new, as has been done by the Ordnance Survey.

THE report of the select committee of the House of Commons on the Patent Agents Bill has been issued. The committee concur in the opinion formerly expressed by the committee of 1865 and 1866. The committee consider that while it is desirable that there should be a roll of duly qualified agents practising at the Patent Office, there should be no regulation which should prevent solicitors or other professional men from doing the same, or compel the inventor to employ any particular class of agent, or any agent at all. The committee believe that it would be most undesirable to put the exclusive right of communicating with the Patent Office in the hands of any body of men, or to create a monopoly for their advantage. At the same time the committee are of opinion that it would be of public advantage to give to persons practising as patent agents an improved professional standing and organisation, and to establish disciplinary control with reference to them. The committee also think that it would be desirable to a certain extent to associate with patent agents persons who, as trade-mark agents, transact business at the Patent Office, and have patent agency work frequently entrusted to them. Finally, the committee hope that the Bill reported by them as amended will give all reasonable facilities for such persons to become registered patent agents.

ON Wednesday there was a meeting of the Huddersfield Town Council to consider the subject of the proposed hospital for infectious diseases at Mill Hill. The designs sent in had been examined by Mr. A. GRAHAM, architect, and Dr. WHITELEGGE, who had awarded the premiums to the following competitors:—First, "Aspect," Messrs. ED. THOMAS & SONS, Queen Anne's Gate, London; second, "Microbe," Messrs. GROLL, MINTY & WEBBE, Hampstead Road, London; and third, "Efficiency and Economy," Messrs. R. THORNTON, SHIELLS & THOMPSON, and "Hygeia," Mr. J. W. DONALD, South Shields (bracketed). The chairman of the health committee stated that they would not undertake the erection of the buildings until a necessity arose. The town clerk said that by the conditions they were not obliged to commence operations at once, but whenever they did so they were bound to give the work to the authors of the first design and to pay them a commission of 5 per cent. One of the aldermen said he considered the first design was not the best adapted for the site. A decision was not given.

WHEATFIELD LODGE, HEADINGLEY, YORKS.—THE HALL.

WHEATFIELD LODGE, HEADINGLEY, YORKS.—THE BILLIARD-ROOM.

A SMALL COUNTRY HOUSE AT STEEP, NEAR PETERSFIELD.

THIS house, a perspective sketch of which forms one of our illustrations this week, is now in course of erection at Steep. The site is on the southern slope of the downs, and commands most extensive views towards the coast, which can be fully enjoyed from the balcony and verandah.

The plan has been specially arranged with a view to possible future extension. The work is being carried out by Messrs. GAMMON & SON, builders, of Petersfield; from the designs and under the superintendence of Messrs. CHAS. SMITH & SON, architects, Reading.

MALABAR, TRURO.

THIS residence, approaching completion, has been erected near Truro for Mr. W. CHIVELL. It stands in its own grounds of about 25 acres, and takes the place of an old building. The elevation is somewhat lofty, taking advantage of the fine views which the site commands.

The walls are faced with a green-tinted freestone from Bodmin quarries, the dressings being of granite from Messrs. FREEMAN'S works at Mabe, and the pilasters to entrance porch of polished Aberdeen.

The joinery of the principal rooms on ground floor is of teak wood, and some very effective carving is introduced in the dining-room, hall and doors. The ceilings of dining and billiard-rooms are panelled and enriched in plaster, both rooms having a moulded teak-wood dado. The dining-room has an oak parquet floor, and the floor of billiard-room is laid with solid wood blocks.

The house throughout is extensively fitted with all modern appliances, and well lighted in every part.

The whole of the internal fittings have been specially designed by the architect, Mr. SAMPSON HILL, of Redruth, and the work has been faithfully carried out by Mr. M. CLEMENS, of Truro, through his own staff.

SUSSEX ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Sussex Archæological Society was held in Horsham on the 9th inst. The remains of antiquity in the town were visited under the guidance of Mr. A. Garraway Rice, F.S.A. Among the buildings pointed out were the half-timbered building known as North Chapel, and Horsham Park House. The Carfax, an open space on which fairs were held, was described. It still retains the ring to which bulls were tied for the barbarous sport of baiting, which was practised in Horsham until 1811. It was pointed out that a band-stand with its surrounding flower-beds might be considered as marking the space formerly known as the Gaol Green, which was in front of the old gaol. That building was superseded in 1775 by a prison in East Street, and had the unenviable reputation of being the last place in England where the sentence of pressing to death was carried out on prisoners who declined to plead. The cellars of some houses in Richmond Terrace are believed to have formed parts of the gaol. The old Horsham houses, judging by the few that have survived near the Green, were not remarkable for height. A house on the Causeway is supposed to have been erected in the time of Henry VIII., but the front has been modernised. The Manor House dates from 1704. If Horsham cannot display surprising examples of Domestic architecture, there is enough remaining to suggest a respectable county town.

The parish church was, however, the principal attraction for the visitors. In the parish room was exhibited a collection of antiquities, mainly from Sussex, including firebricks and other examples of local iron manufacture, rubbings of brasses, chests, &c. On such occasions nothing seems more interesting than relics, and as some bones in one of the cases were described as the remains of the wife of Richard I. the show became a success. Horsham Church was described by Mr. L. Lewis André, who of late years has rendered efficient service at the meetings. The vicar prepared a paper on his predecessors in office. Among the later clergymen who had charge of Horsham was Hugh James Rose, who was said to be the best preacher in England, but for the purpose of increasing the accommodation in the church to enable people to hear him old

work was sacrificed, the chancel screen being one of the victims. John Fisher Hodgson, who was vicar from 1840 until 1884, was zealous for improvements. His first important act as vicar was to rebuild the Parsonage House upon a better site, and to surround it with the lawn and gardens which give it a peculiar charm, but his great work was the rescue of the parish church from decay and in some points from absolute ruin. Opinions may differ as to the taste and judgment displayed in this "restoration" by the architect, but this should not in any way detract from the gratitude due to the vicar for the zeal and munificence which he displayed in the achievement of a great and costly undertaking.

After luncheon the annual meeting was held. The hon. secretary, Mr. H. Griffith, expressed a desire to have a representative of the Society in every parish of the county, in order that all discoveries might be at once notified to the committee.

Mr. Davis said he should be glad to obtain subscriptions towards the amount required, about 700*l.*, for the preservation of the castle, gateway and church at Rye. It was decided to submit the subject to the committee for consideration.

A journey was next undertaken to Shipley Church, which was described by the Rev. E. S. Arkle. He said the date of the building of the church was unknown, but that one existed in the twelfth century is evident from a grant to the Knights Templars. The church was subjected to restorations in the latter part of the seventeenth century, and in 1832, when much injury was inflicted. In consequence, the remains of antiquity were few. The recent restoration at the expense of Sir Robert Loder enabled examples of the old painting and carving to be revealed.

At Knepp Castle the members were received by Sir Raymond Burrell. Afterwards West Grinstead Church was visited, and it was described by the Rev. Knatchbull-Hugessen. It contains many objects which are interesting, and the visit was a satisfactory ending for a day which afforded much enjoyment to all who were able to take part in the proceedings.

THE GLASTONBURY PREHISTORIC VILLAGE.

A REPORT on the Lake Village at Glastonbury was presented to the British Association on Monday from the committee, consisting of Dr. R. Munro, chairman, Mr. A. Bulleid, secretary, Professor W. Boyd Dawkins, General Pitt-Rivers and Sir John Evans. The work at the British Lake Village, near Glastonbury, has been much retarded by the flood-water that accumulated during the winter and by the heavy rains during the spring. The following facts have been established:—(a) That the village was originally surrounded by the water of a shallow mere; (b) that 5 feet of peat accumulated during its occupation; (c) that a strong palisading of posts and piles protected the village; (d) that the groundwork of the village, so far at least as its margin is concerned, is artificial for the depth of 5 feet. Numerous and important objects have been unearthed this season from the peat outside the village at all depths down to 7 feet 3 inches, and as far as 80 feet from the village border. Pottery—hand and wheel made—clay pellets (so-called sling-stones), baked and unbaked, and bones of animals are still met with at all points in great quantities. Recently a decorated wheel-made bowl of black ware has been found in perfect preservation and highly finished, 4 inches high and 5 inches across the rim, besides numerous other pieces of pottery elaborately marked with designs of circles, curved and flowing lines, and triangles. The find of greatest importance in bronze has been a well-preserved bowl measuring 4½ inches across the rim. Among the other objects of bronze are two more spiral finger-rings and a penannular ring brooch. In iron there is a reaping-hook, together with its wooden handle 16 inches in length, and a primitive sickle, with rivetted wood handle complete, in length 10 inches. More human remains have been met with this year than previously, including a complete skull showing several sword or axe marks; no other bones belonging to the body were discovered near it. There still remain two-thirds of the village border to be traced, and nearly fifty dwelling-mounds and about five-sixths of the entire village area to be examined. All the objects that it has been possible to move to the Glastonbury Museum have already been placed and arranged there in the cases.

The Examiners of the London water-supply say that the conviction has been forced upon them that the samples of water collected and presumed to be respectively from the New River and Chelsea mains, were, through some systematic error, really the same water. It has been discovered that the samples, which were drawn from standpipes supposed to be supplied by the different companies, were really both supplied by the New River company.

THE TRUE PRINCIPLES OF POINTED OR CHRISTIAN ARCHITECTURE.

By A. WELBY PUGIN.

(Continued from page 93.)

I WILL now give the following distinct reasons why the architecture of the Greek temples cannot be introduced or imitated with propriety by Christians.

1. These temples were erected for an idolatrous worship, and were suited only for the idolatrous rites which were performed in them. The interior, entered only by the priests, was comparatively small, and either dark or open at the top, while the peristyle and porticoes were spacious, for the people who assisted without. There is not the slightest similarity between our worship and the idolatrous worship of the Greeks. We require that the people should be within the church, not outside. If, therefore, you adopt a perfect Greek temple, your interior will be confined and ill-suited for the intended purpose, while your exterior will occasion an enormous outlay without any utility.

If, on the other hand, you strip a Greek temple of its external peristyle, and build your external walls in the place of the pillars, you entirely destroy the most beautiful feature of the architecture, and the building becomes a miserable departure from the style it professes to imitate.

4. Our northern climate requires an acute pitch of roof to prevent the accumulation of snow and to resist weather.* The Greeks, whose climate is the reverse of ours, had their roofs and pediments exceedingly flat, nor could they be raised to our proper pitch without violating the character of their architecture.

Elevated Greek Roof.

In short, Greek temples are utterly inapplicable to the purpose of Christian churches,† and the attempt is little short of madness when our country is literally covered with beautiful models of ecclesiastical structures of every dimension, the architecture and arrangement of which have originated in their wants and purpose. An old English parish church, as originally used for the ancient worship, was one of the most beautiful and appropriate buildings that the mind of man could conceive; every portion of it answered both a useful and mystical purpose. There stood the tower, not formed of detached and misapplied portions of architectural detail stuck over one another to make up a height, but solid buttresses and walls rising from a massive base, and gradually diminishing and enriching as they rise, till they were terminated in a heaven-pointing spire surrounded by clusters of pinnacles, and forming a beautiful and instructive emblem of a Christian's brightest hopes. These towers served

Old English Parish Church.

2. The Greeks did not introduce windows in their temples; they are essentially necessary with us. Perforate the walls with windows, and you again destroy the simplicity and unity of Greek architecture, which its admirers extol as one of its greatest beauties.

3. Christian churches require bells, by the sound of which the faithful may be called to their devotions. The bells, to be distinctly heard, must be suspended in a tower or belfry, and these are features utterly unknown in Greek architecture. A tower composed of a number of small porticoes set over one another, and placed in front of a mock temple, is a most glaring absurdity, nor is a tower of this description, starting out of nothing at the top of a portico, any better (for illustrations, see page 92).

a double purpose, for in them hung the solemn-sounding bells to summon the people to the offices of the Church, and by their lofty elevation they served as beacons to direct their footsteps

* It is to be remarked that flat-pitched roofs were not introduced into English Pointed churches till after the decline of that style, and the marks of the old high gabled roofs are generally to be seen in the towers of those churches where the present roofs are flat, proving them to have been altered subsequent to the original erection of the buildings.

† Neither are they better adapted for domestic purposes, for it is still more absurd to see two or three tiers of windows introduced in the shell of a Greek temple, the roof of which is broken by numerous stacks of vainly disguised chimneys. Yet notwithstanding the palpable

to the sacred spot. Then the southern porch, destined for the performance of many rites; the spacious nave and aisles for the faithful; the oaken canopy carved with images of the heavenly host, and painted with quaint and appropriate devices; the impressive doom or judgment pictured over the great chancel arch; the fretted screen and rood-loft; the mystical separation between the sacrifice and the people, with the emblem of redemption carried on high and surrounded with glory; the great altar, rich in hangings, placed far from irreverent gaze, and with the brilliant eastern window terminating this long perspective, while the chantry and guild chapels, pious foundations of families and confraternities, contributed greatly to increase the solemnity of the glorious pile. Such is but a faint outline of the national edifices which have been abandoned for pewed and galleried assembly-rooms, decorated only with gas-fittings and stoves, and without so much as one holy or soul-stirring emblem about them.

We will now examine architectural propriety with reference to collegiate architecture. Our old English Catholic colleges will illustrate most beautifully the principle I wish to demonstrate. The main feature of these buildings was the chapel; to our Catholic forefathers the celebration of the divine office with becoming solemnity and splendour formed a primary consideration, and ample was the provision made for this pur-

considered a defect by ignorant modern artists, but will be found on examination, like all other practices of the ancient architects, to be based on excellent practical reasons.

The advantages of this arrangement are as follows. 1. All the internal space usually occupied by chimney stacks, and which is very considerable, is gained to the apartments. 2. The stacks of chimneys thus placed act as buttresses to the wall. 3. The danger of fire consequent upon chimney flues passing through the woodwork of the roofs is entirely avoided. 4. A great variety of light and shadow and a succession of bold features are gained in the building (see next page). It is impossible to conceive any buildings better adapted for collegiate purposes, either as regards arrangement or design, than the two establishments founded by that great and good man, William of Wykeham, at Winchester and Oxford. He had two classes to consider in his foundation at Winchester, the clergy and the students. For the former he provided beautiful cloisters retired from the rest of the edifice, suited for contemplation and devotion; while for the latter he assigned ample space for healthy recreation in bad weather and level meadows for summer sports. The whole character of these buildings is at once severe, elegant and scholastic; it is precisely what it should be, as the will of Henry VI. specifies of the domestic portion of his college at Cambridge, that it should

pose in all the old collegiate foundations. The place set apart for this holy purpose generally towered over the surrounding buildings. The chapels of King's College and Eton can be distinctly seen many miles before the subordinate buildings can be discerned. Oxford, at a distance, presents a complete grove of towers, spires and pinnacled turrets rising from the collegiate churches. After this principal feature, every portion of these edifices had its distinguishing character and elevation; in order to give due effect to the gate-house, refectory and other important parts of the building, the chambers never exceeded the height of one storey above the ground floor.* A very characteristic feature of the old collegiate buildings is the position of the chimneys, which are made to project from the front walls of the buildings. This, I am well aware, has been

impracticability of adapting the Greek temples to our climate, habits and religion, we see the attempt and failure continually made and repeated: post-office, theatre, church, bath, reading-room, hotel, Methodist chapel, and turnpike-gate—all present the eternal sameness of a Grecian temple outraged in all its proportions and character (see woodcut, page 108).

* In those ancient colleges where these chambers have been raised in modern times, the effect of the original design has been completely ruined; and the new collegiate buildings at St. John's, Cambridge, from their height have all the appearance of a Gothic warehouse or factory. This is another instance of the folly of using Pointed details without following the spirit of the ancient buildings.

be built without too great superfluity of detail or "busie" moulding; * and on this principle Wykeham designed his building. The external ornaments are few, but admirably selected; an image of our blessed Ladye with our Lord is placed over each gateway, in reference to the college being dedicated to God, under the invocation of His blessed mother, towards whom the good bishop entertained an extraordinary devotion, even from his tender years. The other images on either side of the centre niche are those of the angel Gabriel, and Wykeham himself in a kneeling position.

The interior of the chapel (now wofully disfigured), as left by the founder must have been glorious in the extreme; it consisted of a choir and ante-chapel, by the side of which rose the bell-tower, simple, but elegant and lofty.

The members of the society were buried in the cloisters,

* Notwithstanding the directions contained in this will, where the founder's intentions regarding his collegiate buildings are fully and distinctly expressed, the architect (when the glorious opportunity offered a few years since of fulfilling them to the letter, and erecting a truly fine building) was allowed to depart entirely from them, and raise a florid structure, arranged in direct opposition to all old collegiate traditions, and the very decorations of which were misapplied details taken from the original chapel, which had been elaborately enriched by the ancient builders for the purpose of distinguishing its sacred destination from the surrounding erections.

and also in the ante-chapel, as their memorials of beautifully-engraved brass testify. The intention of these was, doubtless, both to incite the surviving community to pray for their souls' repose, and to remind them continually of the similar fate that would inevitably befall them. How Catholic wisdom and Catholic piety stand conspicuous in all the arrangements of

An Adapted Greek Temple.

these noble buildings! How great the master mind who planned and executed them, and yet how few are there in these days able to understand or willing to imitate them. Can we conceive a more atrocious scheme to destroy the solemn grandeur of Wykeham's church than to allow such a man as Sir Joshua Reynolds to design a transparency for the western end, and appoint James Wyatt the destructive to overturn the ancient features and arrangements, setting up the subsellæ of the stalls

Arrangement of College Chimneys.

as brackets for book-desks, and covering the walls with meagre decorations and Bernasconi Gothic?

A Modern College.

Modern collegiate buildings,* especially on the Continent, are the reverse of all that I have been describing. In them we

* It is impossible to conceive a more uncollegiate-looking building than what is called the London University, with its useless dome and portico. It may, however, be urged in its defence that any thing ecclesiastical or Christian would be very inappropriate, and that the pagan exterior is much more in character with the intentions and principles of the institution.

look in vain for the solemn quadrangle, the studious cloister, the turreted gate-house, the noble refectory with its oak-beamed roof, the mullioned windows and pinnacled parapet and lofty tower of the church; not a ghost of these venerable characteristics of a college is to be seen, but generally one uniform mass, unbroken either in outline or in face, undistinguishable from other large buildings which surround it. As to its purpose, it might be taken for a barrack hospital or asylum. How is it possible to expect that the race of men who proceed from these factories of learning will possess the same feelings as those who anciently went forth from the Catholic structures of Oxford and Winchester? We cannot sufficiently admire our English universities; there is nothing like them existing on the Continent, notwithstanding the miserable conditions and modernisations which have so greatly disfigured the ancient buildings. There is more Catholic scholastic architecture to be found united at Oxford than in any place I have ever visited. Let us hope and pray that its glories may not exist in vain, but that learned and thinking men may be led to draw a parallel in their minds between the faith of those good souls who founded these noble institutions and our present degraded and half-infidel condition, by which consideration they may be led back to Catholic unity and faith, in which great works can be alone accomplished or blessings derived from them.

(To be continued.)

TECHNICAL EDUCATION.*

NEWBURY, as all the world knows, was anciently renowned for its manufacture of cloth, and though I speak with some hesitation in the presence of those knowing better than myself, I believe three of its most interesting architectural monuments attest the wealth and importance of its townsmen formerly engaged in that industry. I allude to the tower of the parish church, built by John Winchcombe, your far-famed "Jack"; to Shaw House, erected by his rival in trade, Thomas Dolman, and to the ancient Cloth Hall, a relic of the past importance of that trade, much rarer in England than in the Low Countries. It therefore seems to be peculiarly fitting that a commodious building of architectural character, and well adapted for technical instruction, should be established in this ancient seat of prosperous trade. A building which, under the fostering care of your Corporation, may help to stimulate if not a revival of the particular industry which gave in Tudor times such importance to your town, at any rate industrial activity in some other direction. If coal must be used in such new departure, you have in your townsmen's (Mr. Elliott's) invention a means of washing your smoke, and so preserving the pure and invigorating qualities of Newbury air. And perhaps in time, by your studies and your ingenuity, you may see your way to utilise the very force of the air as its rushes past for the production of some motive power which will dispense altogether with the use of coal in manufacture. This would indeed be an achievement worthy of Newbury's reputation.

The pupils in your school of art, now to be located in your new premises, are showing the results of Mr. Coles's excellent teaching in very good work. In science, as is perhaps natural, there is not as yet so great a thirst for instruction. At first sight science is not to most so attractive as art. Yet there is no gainsaying the great advantages to be derived from a knowledge of practical chemistry, of geometry, mechanics, of building construction, to Berkshire people especially of botany and the principles of agriculture, to many of shorthand and to all of cookery. On this latter subject I am an enthusiast, not that I know anything about its mysteries, however much I should like to. I once began to sit at the feet of a professor of the art at South Kensington, but was laughed at for my pains. Though we ought not to live to eat, yet we must all eat to live, and it is consequently of enormous importance that what we eat should be palatable and digestible. The chemistry, therefore, of our food, and its proper preparation, are not subjects to be despised or considered beneath the notice of cultivated people. I suppose there is no country under heaven where the materials, the raw materials, of good food are so easily procurable and so varied as they are in England, and no country where so little is made of them, where there is so much waste in their preparation. Some ladies are, I understand, now studying the art of cooking as a career in life, and they are to be honoured for it. They will not only become in this way highly useful members of society by their practice of the art, but will be able by their knowledge to lend assistance and impart instruction to their less favoured sisters, the wives and daughters of labouring men, who only too frequently do not know the secret of living both economically and well, do not know how to make the most of the provisions they buy, and so

* An address by Mr. Waterhouse, R.A., delivered at the opening of the Newbury Technical Institute on the 8th inst., and published in the *Newbury Weekly News*.

the hard-earned wages of the bread-winner are in part wasted. We say "bread-winner," and rightly, so long as the chief food of the family is the everlasting bread and tea, the latter very often without any milk to it. Why should it not be for a variety oatmeal-porridge winner, or lentil-soup winner, if the women of the household did but know how to prepare attractively such nourishing and excellent dietary?

We hear much of the danger of foreign competition robbing England of her trade, and consequently of her wealth, and such danger is already at our doors. This danger arises from two causes. First, from foreign labour producing more for less wages, and secondly, from this labour being often directed by more intelligence than ours. It is this latter cause of our deficiency, the lack of the due influence of mind on matter, that these grants for technical education are intended to rectify. It is most earnestly to be hoped that the people of England will avail themselves of the opportunities now perhaps for the first time presented to them, and seek to be guided more and more by intelligence in their work, and not so much as formerly by that dear old "rule of thumb." This is the more important as we do not wish to see our people overworked. Many of the workers in the most well-to-do continental nations labour fourteen, fifteen or sixteen hours a day. This will not do any longer for us Englishmen. We must have our time for recreation and for improving our minds. And quite right too; without something worthy of our interest to occupy our leisure, we may perhaps be better without it. Let us then put all our energies, physical and mental, into our work while we are about it, and have a care that our leisure hours are well spent also. And where, may I ask, sir, could they be better spent in the long dark evenings of autumn and winter, at any rate, than in that temple of technical instruction which you have just raised for the benefit and enjoyment of the people of Newbury?

For the evenings of spring and summer there are perhaps purer joys even than those offered by your excellent institution. I mean in the study and appreciation of nature. To many this may seem a somewhat vain and frivolous pursuit. To mere money-making people it is profitless; even to those whose hearts are set on higher things it may seem so too. But the fact remains that we have been placed in a most beautiful world, and in this immediate neighbourhood is not the least beautiful part of it. Its wonders, its mysteries, invite us all—are open to all. The poorest as well as the most well-to-do of us have offered to them in the beauties of nature an inexhaustible feast, almost intoxicating to the senses, giving joy to the heart, an antidote to the petty worries of existence. Yet how few avail themselves of the good thus provided for them? If we search for the cause it is not far to seek. We have eyes, but they see not; ears, but they hear not. The cause for our blindness, our dulness, our apathy and indifference, is to be found in our ignorance and want of study. We do not train our eyes to observe, and we cannot see what we know and care nothing about. To take a familiar instance or two. Many people would say that in summer all trees are green, whereas they are all grey, inclining to green more or less, with every variety of hue and tone, their upper surfaces bluish when reflecting the sky, their under surfaces reddish when reflecting sunlit earth; their young July shoots are yellowish, or, as in some oaks, rose-colour. The unobservant would not notice the way in which various sorts of trees receive the sunshine or the diffused light of a dull day; the broad masses of it which settle on the elm, the bright points on the oak, the feathery tufts of light which enliven the foliage of the ash. Nor would they notice the peculiarities of tree-growth: some species inclining to a pyramidal form, with central stem and leader, others with forked branches to a more globular shape, or to a flattened head or to pendulous branches. Nor would they notice how special circumstances modify these characteristics of race, how wind persistently blowing from one quarter will incline the tree's growth to leeward; how the shade of other trees will drive it to strange manœuvres in its search for light and sunshine. What pursuit is more fascinating to the observant than the study of reflections in almost still water? Wayward they seem to be, and yet all submitting to inexorable law, from the point where they begin, so well defined, from the opposite bank to where they lose themselves in the submerged sunlit pebbles at our feet.

But, you will say, what has all this to do with the brave new school of technical instruction we are opening to-day? Why would you send us out into the fields, woods and commons, when we have just acquired this new source of interest and enjoyment at our very doors? To the point then without more to do. I notice that by far the larger number of your students hitherto have been those who attend the drawing classes. Drawing is in my opinion the best key whereby to unlock our appreciation of the beauties of nature, and it is here, under the able direction of your art master, that you can be put in possession of this precious "Open sesame." If rightly practised, drawing teaches us to observe with an intelligent eye. It is not merely necessary to acquire dexterity in the use of

pencil and brush. We need work with head and heart as well as with hand, and there is yet another faculty which the art student ought to practise—that of memory. I would commend the habit, after a careful study of any object in the schools or scene out-of-doors, of reproducing it from memory only, and then comparing it with the original study, or better still, with the subject itself. The knowledge beforehand that he is going to put his memory to so severe a test will act as a powerful incentive to the student to keep his mind while at his sketch on the *qui vive*. He will observe the proportions of things, the subtlety of the curves of nature, the harmony and delicacy of her colouring in a way unknown to those to whom this method is unfamiliar. To the architectural student I know this practice to be of the greatest value, a short cut, if such a thing there be in art, to available knowledge and self-reliance.

So then let us learn to draw from motives apart from the hope of becoming professional artists. From their own standpoint the world is already too full of them, and possibly from the very prodigality of their output is more chary than it used to be of becoming possessed of modern pictures. Even painters of the greatest distinction are now by no means sure of disposing of their works, though such works were eagerly sought for and purchased some few years ago; and English art certainly shows no sign of retrogression. I would not therefore by any words of mine encourage the production of pictures as a means of livelihood; but I would do all in my power to advocate the learning to draw, as an accomplishment most useful in itself, as a source of great pleasure to its possessor, and chiefly as a means, and perhaps the most effective means, of approaching the study and appreciation of the beauties of nature. While saying this I would not have us forget that a knowledge of botany, geology, and other branches of natural science is also an important means to this end.

Our national education, in which of course I include institutions of this kind, should, I think, be made to lead the rising generation to regard as something sacred the beauties of the world in which God has placed us, as one of His best gifts to man. They should be taught to look with aversion on everything which tends to degrade or destroy those beauties; on such things as waste paper thrown carelessly about in meadow and hedgerow, on the discarded tins, kettles and other litter which now too often give an untidy, unworthy character to many an otherwise attractive Berkshire village, and, above all, our children should be taught to view with abhorrence the senseless and selfish work of the bill-sticker in spoiling and rendering sordid the aspect of our towns and the charms of the country. It takes, they say, a good deal to rouse the British Lion, but I confess I am sometimes amazed that he takes so quietly, without an occasional roar and lashing of his tail, the disfigurement of his heritage at the hands of the selfish and often gulling advertiser. Not only are the pleasures and dignity of his existence imperilled thereby, but he has to pay dearer for his wares, or else get them of inferior quality, for does he not see millions of money spent annually in advertising, and is he not aware that all this money comes out of his own pocket (if he have a pocket), poor old long-suffering British Lion? Now if he chose, the schoolmaster could cure all this in the course of another generation by exposing such chicanery, and giving our children right views as to their duties and obligations to help keep the world in its beauty for the good and pleasure of all. A healthy anxiety for the enjoyment of others would, I believe, even lead us further. We should be careful that our persons, our houses, our gardens and fields should be as attractive and pleasant as our means would admit of, not to gratify personal vanity, but our own and other's sense of the decorous and beautiful. This generally will be of easy accomplishment. We shall have only to preserve what is beautiful and prevent its disfigurement.

Again, the same spirit would make us careful not ruthlessly to destroy what remains to us of the good work of our ancestors, especially in the way of architecture. The building art in this country was a traditional art up to comparatively modern times; that is to say, the style of a building did not depend upon the whim of its designer. Its style was the style of the day, and though style changed, it changed very slowly and from natural causes. This reality and spontaneity of style gave a charm to old buildings, which modern ones in these eclectic days can never possess, and it behoves us jealously to preserve what has come down to us from the past, not only for our own admiration and profit, but also for the benefit of our children. I hope, therefore, that the town of Newbury will make a strenuous effort to keep intact and in repair its ancient Cloth Hall and Granaries, which are, as I have before remarked, one of the three remaining attestations of its former renown as an important centre of England's commercial and manufacturing activity. Your wealth and your taste may yet give to Newbury many a noble building, but you can never have again another Jacobean Cloth Hall. It is a possession which the town ought to be proud of, and guard against ruin and destruction.

I will conclude my remarks by wishing your new school of

technical instruction success and prosperity. Its premises appear admirably adapted not only for art teaching but for instruction in various other matters in which excellence may be attained by tuition wisely directed under skilled masters. I understand it is contemplated to have a class for carpentry and wood-carving. There is a great future, I believe, for artistic pottery and artistic metalwork in brass and iron, in which much success may be attained even by those whose employments during the day would hardly seem to conduce to such success. Even in our little village of Yattendon articles have been made in brass and copper which have been honoured by the approval of, and purchased by members of the Royal Family, and that without the assistance of a grant from the county council or such excellent premises and instruction as are now at your disposal. I believe that the county councils do not allow of the sale of work actually done in these schools from a consideration for trade interests; but with a view to the future of your pupils I may perhaps remind you that the Rural Industries, a Society formed for the encouragement of work of this kind, with a shop for its display in New Bond Street, is ready to co-operate with them when they have produced works sufficiently creditable for exhibition and sale. This Society has an exhibition for such work at Oxford during the present meeting of the British Association. There is also the Society called the Home Arts and Industries Association, to which Yattendon and perhaps other Berkshire villages are affiliated, which collects in June the work of its branches during the past winter at the Albert Hall, South Kensington, and which is becoming every year more of a success, both from the excellence of its exhibits and the extent of its sales. There is, I cannot doubt, a very bright future for the Newbury school, if its pupils are animated by that enthusiasm and perseverance which can alone command success.

DUMFRIES AND DISTRICT.

THE third field meeting of the Durham and Northumberland Architectural and Archaeological Society was held recently at Dumfries, for the purpose of visiting the interesting ecclesiastical and baronial antiquities in the neighbourhood of that historic town. A large company of ladies and gentlemen, the *Newcastle Journal* says, attended the meeting, and assembled at the Dumfries railway station, on the arrival of the express from Carlisle at two o'clock. The Rev. Canon Greenwell, president of the Society, and Mr. Oliver Heslop, one of the hon. secretaries, had charge of the party, for whom conveyances were awaiting, in which they at once set out to visit Sweetheart Abbey, the ruins of which are beautifully situated at the foot of Criffel, near the mouth of the Nith, some seven miles from Dumfries. The weather being very fine, a most enjoyable afternoon was spent. The party first visited Kirkcudbright House, where they were received by Mr. Maxwell Witham and Captain Stuart, and shown several antiquities and interesting relics of the Stuarts preserved in the house. This Kirkcudbright is not to be confounded with the better known place of the same name in Annandale, famous in connection with the beautiful ballad of "Fair Helen." Originally, however, it had been a Border keep—one of the fortified houses of the great family of Maxwells of Nithsdale—and the baronial features of the building are in excellent preservation, whilst it is embowered amongst fine trees. When the company had assembled on the lawn the Rev. Canon Greenwell in a few words gave a general explanation of the programme of the meeting and of the places to be visited. Mr. Wm. Brown read a short paper on the history of the three Kirkcudbrights of Dumfriesshire and Galloway, with special reference to that which they were visiting, and Mr. C. C. Hodges made some observations on the purpose and the architecture of the Border pele towers.

The company then, under the guidance of Captain Stuart, walked over to New Abbey, a distance of two miles through pretty scenery, under the shadow of Criffel, with Loch Kinder lying at its foot gleaming like a mirror in the sunshine, and the waters of the Solway spread out to the southward, across which the opposite English coast was clearly visible, the background being supplied by the shadowy outline of the Skiddaw range. Having first visited the ruins of a square pele known as the Abbot's Tower and evidently connected with the old monastery, the party walked on to Sweetheart Abbey, close to which nestles the little village of New Abbey. This is one of the finest and best preserved of the ecclesiastical antiquities of the South of Scotland. It was a Cistercian house, the daughter of the more ancient foundation of Dundrennan, near Kirkcudbright. It was founded by the noble Lady Devorgilla of Galloway, of the royal line of Scotland, the wife of John Baliol, lord of Barnard Castle and founder of Baliol College, Oxford. After the death of her husband in 1269, Lady Devorgilla had her husband's heart embalmed and preserved in a silver casket in the abbey, which in consequence was called

"Dulce Cor, Douz Quer," or Sweet Heart. The circumstance is quaintly related by Wyntoun in his rhymed Scotch chronicle of the fifteenth century, which further asserts that the lady whenever she sat down to meat had the casket enclosing her husband's heart placed beside her on the table, and

Till her lord, as in presens,
Ay to that scho dyd reverens.

History records no more remarkable example of devoted widowhood, and has few nobler names than those of the Lady Devorgilla and her husband, whose lives seem to have been devoted to far-reaching works of munificence. Their son became King of Scotland, but was not destined to perpetuate the line, though it is remarkable that after the death of the grandson of Robert Bruce the Crown again reverted to the Stuarts of Galloway, the family of the Lady Devorgilla. The history of the abbey, as far as is known, was sketched by Mr. William Brown. The last abbot was Gilbert Brown, who survived the dissolution and destruction of the monastery by the Presbyterians, and had many a bitter conflict with the reformers. He only escaped the vengeance of the Council in Edinburgh by reason of his hopeless physical condition, and died in France. He is described as "an avowed Papist," and also "suspect to be an usar of magick and other unlauchfull sciences, condemnit be the lawis of God." Poor Gilbert Brown had evidently a hard fate, and might well have adopted to himself the lines of Milton, had they then been written:—

Fallen on evil days and evil tongues,
And old and blind and desolate.

Mr. Hodges gave a most interesting account of the architectural features of the abbey, which partake of the general characteristics of the Cistercian foundations, though with some peculiarities, one of which gives rise to the conjecture that it was built by Scottish masons on a plan supplied by English architects, and that the builders were not familiar with the style and made some blunders in working out the details.

Having inspected the abbey and its interesting precinct wall, and admired the exceeding beauty of the scenery, the party walked up to Chamberley, the residence of Captain Stuart, well situated on the craggy rising ground to the west of the abbey, amidst umbrageous woods, where they were hospitably refreshed with tea. Rejoining their conveyances, and with a hearty cheer for Captain and Mrs. Stuart in recognition of their kindness and hospitality, the party drove back in the cool of the evening to Dumfries, proceeding by the higher road close to the foot of the Galloway Hills. They dismounted at the King's Arms Hotel, where dinner was waiting, and where the party spent the night.

Another beautiful morning welcomed and gladdened the archaeological excursionists next day, who, after an early breakfast, set out. Dumfries certainly looked its very best as the brakes containing the party passed over the bridge into Maxwelltown on the way first to visit the ruins of Lincluden Priory. Regret was expressed by many that time could not have been found for inspecting the pleasant town, which rejoices in the ambitious name of "The Queen of the South," and is interesting, among other features, for its relics of Robert Burns. The church of Greyfriars, passed by the party, is built upon the site of the more ancient edifice in which Robert Bruce stabbed the Comyn, and the site of this "bluidy and sacriligious dede," which determined the destinies of Scotland, is still preserved and marked off in the modern church. Closely adjoining the bridge, over which the high road into the Stewartry crosses the Nith, is the older bridge, originally constructed by the famous Lady Devorgilla, of whom we have already spoken.

Lincluden is famous both as an ecclesiastical antiquity and for its more recent association with Burns, of whom, during his residence in Dumfries in the closing epoch of his life, it was a favourite resort and lounging-place. Burns did not disdain the concomitants of place and scenery as aids to inspiration, and used to linger in the ruined priory until the moon shone in upon him through the traceried windows. There, according to his own statement, he made and revised many of his songs, which were then his principal literary productions. The late George Gilfillan, of Dundee, one of the biographers of Burns, in characteristic verses records the visit he paid to Lincluden Priory in company with Thomas Aird, then living in Dumfries. The lines thus begin:—

To Lincluden Abbey once we walked,
In the cool twilight of a burning day,
With one, a poet of the truest grain,
Who erst on Arksbeck's Mount had tracked the Fiend,
And probed the sultry secrets of his soul.

Gilfillan went to Lincluden for the purpose of realising to himself the effect of Burns's nocturnal visits, but other and less poetical objects attracted the members of the Durham Archaeological Society. The ruins of the nunnery are situated at the confluence of the Cluden with the Nith, on a fine sloping bank close to the first-named stream, which runs through a

beautiful sylvan glen. It was originally a Benedictine nunnery, founded in the latter part of the twelfth century by Uchtred, son of Fergus, Lord of Galloway, but was converted into a collegiate establishment two centuries afterwards by Archibald, the grim Earl of Douglas. The foundation was enlarged about 1429 by Margaret, Countess of Douglas, eldest daughter of Robert III. She died in 1440, and was interred in a magnificent tomb in the choir, which bears a Latin inscription, still easily decipherable. In front of the tomb is a row of nine shields, bearing the arms of Brus of Annandale, Brus of Skelton and others. There is some rich carving in parts of the building, very French in style, as is all the work in the church. A brief description of the building was given by the Rev. Canon Greenwell, who also referred to the circular mound closely adjoining the ruin, which, he said, from the slight examination he had been able to make of it, was evidently one of those so-called mote-hill mounds, common in this part of the country, which were originally defensive places constructed by the British tribes in prehistoric times, and were afterwards used as meeting-places, from which the name mote-hill was derived.

As the day's programme was an extensive one, Lincluden was soon left, and the party drove by way of Glencaple down the left bank of the hill to Caerlaverock Castle, which was reached about half-past eleven o'clock. Caerlaverock is a place of very great interest. It was the stronghold of the Earls of Nithsdale and is still in the possession of Lord Herries, the representative of the family. It is remarkable for the strength of its position as one of the gateways into Scotland, protected on three sides by the Solway Firth and the formerly impassable Lochar Moss. It was a triangular fortress, with a strong tower at each of the three corners, two of which are still standing, and the whole work is in a good state of preservation. It was surrounded by an outer and an inner moat, and the inner moat is still intact and full of water. It is, indeed, the only example of a castle with its moat intact existing in Scotland or in the North of England. Nothing is really known of the history of Caerlaverock before its siege and capture by Edward I. in 1300, of which an account is given in a very curious French poem which has come down to us. It is known, however, that an earlier castle stood on a site some few hundred yards from the present ruin; whilst a wooded height which overlooks the tower, called the Ward Law, contains remains of early fortifications, and may be assumed to have been the original "Caer," or British stronghold, from which the castle took its name. A very interesting account of the history of the castle was given by Mr. Wm. Brown, and the architecture was fully described by Mr. Hodges.

After Caerlaverock had been inspected by the party they returned to their conveyances, and drove on to Ruthwell, where the famous Saxon cross, with the Runic inscription, situated in the parish church, was viewed, and a full and interesting description was given of it by Canon Greenwell, and of the reading of the inscription by the late Mr. Kemble. A movement was next made to the railway station to meet the afternoon train which bore the party back to Carlisle. There the cathedral was visited, and the company dined together, and returned in the evening to Newcastle and their several destinations. There was but one opinion, that the meeting had been one of exceptional interest, the pleasures of which had been greatly enhanced by the fine weather enjoyed throughout. Mr. Heslop, who had charge of the party and the arrangements, was deserving of special praise for the assiduous manner in which he provided for the comfort of all the party and the promptitude with which he kept them up to time.

THE GUILDHALL ART COLLECTION.

THE library committee of the Corporation have published their report on their recent art collection at the Guildhall. The paintings exhibited were on view during April, May and June, and all of them were insured at Lloyd's. In all 300,366 persons passed the turnstiles, being an average of 3,580 per day. In obedience to the instructions of the Court of Common Council, the exhibition was opened to the public on alternate Sundays between April 22 and July 1. The total attendance on the six Sundays was 17,530, showing an average of 2,921 each Sunday. On each occasion the greatest order prevailed, no single instance of damage or disturbance having occurred. The descriptive and historical catalogue prepared by Mr. A. G. Temple, the art director, was much appreciated, 38,569 copies having been sold at 6d. each, realising 964*l.*, which had been found not only sufficient to defray the entire cost of the catalogue, but to leave a balance at the committee's disposal which would enable them to dispense with the greater part of the amount of 450*l.* granted by the Corporation to defray the expenses of the exhibition. The committee conclude by referring to "the excellent, experienced and skilful manner in which Mr. Temple, the director and secretary of the art gallery, has

discharged his duties, and the marvellous success which has attended his exertions by the organisation of the three art loan collections in Guildhall." The total net cost of the exhibition seems to have been 443*l.*

GREEK PICTURE-WRITING.

IN the section of Anthropology at the meeting of the British Association on Saturday, Mr. Arthur J. Evans read a paper on "A New System of Hieroglyphics and a Pre-Phœnician Script from Crete and the Peloponnese." He commenced by referring to the wide-spread existence of forms of picture-writing amongst primitive peoples. It stood to reason that analogous systems had once existed within the European area, and some traces might still be perhaps found in such prehistoric relics as the mysterious figures known as the Maraviglie, carved on a limestone rock in the heart of the Maritime Alps. He himself had found painted pictographic designs of a like nature on a Dalmatian cliff, and in Lapland they might still be said to survive. But evidence of the existence of a fully-developed hieroglyphic system on European soil had been hitherto lacking, though recent discoveries had established the fact that in Asia Minor, the prehistoric remains of which showed such intimate connection with those of the Greek and Thracian lands, a hieroglyphic system had grown up, independent of the Egyptian, to which the general name of "Hittite" had been given. The revelations, begun by Dr. Schliemann at Tiryns and Mycenæ and still accumulating every day, had brought to light on the soil of Greece itself a very ancient civilisation, in many respects the equal contemporary of those of Egypt and Babylonia, and they might well ask themselves, Was this civilisation wholly dumb? Were the Mycenæans so far below many savage races as to have no written form of intercommunication? Homer at least contained a hint that some form of written symbols was in use. During a journey to Greece in the preceding year he himself had obtained a clue to the existence of a peculiar kind of seal stones, the chief find-spot of which seemed to be Crete, presenting symbols of a hieroglyphic nature. This spring he had been able to follow up his inquiries by the exploration of the ancient sites of Central and Eastern Crete, and the results of his researches had been to bring to light a series of stones presenting pictographic symbols of the same nature, so that he was now able to put together over seventy symbols belonging to an independent hieroglyphic system. More than this, he had discovered, partly on stones of similar form, partly engraved on prehistoric vases and other materials, a series of linear characters, a certain proportion of which seemed to grow out of the pictorial forms. Both these systems of writing were represented on the diagrams before them. It would be seen that, as in the case of the Egyptian and Hittite symbols, the Cretan hieroglyphs fell into certain distinct classes, such as parts of the human body, arms and implements, animal and vegetable forms, objects relating to maritime life, astronomical and geometrical symbols. Some of them, such as the two crossed arms with expanded palms, belonged to that interesting class of pictographs which is rooted in primitive gesture language. The symbols occurred in groups, and there were traces of a boustrophedon arrangement in the several lines. The comparisons instituted showed some interesting affinities to Hittite forms. Among the tools represented Mr. Evans was able to recognise the "template" or "templet" of a decorative artist, and with the assistance of a model of this symbol, taken in connection with a design supplied by a Mycenaean gem found in Crete, he was able to reconstruct a Mycenaean painted ceiling analogous to those of Orchomenus and the eighteenth dynasty Egyptian tombs of Thebes (c. 1600 B.C.). The linear and more alphabetic series of symbols was shown to fit on to certain signs engraved on the walls of what was apparently a Mycenaean palace at Knôsos, and again to two groups of signs on vase handles from Mycenæ. It was thus possible to reconstruct a Mycenaean script of some twenty-four characters, each probably having a syllabic value. It further appeared that a large proportion of these were practically identical with the syllabic signs that survived among the Greeks of Cyprus to a comparatively late date. This Cypriote system threw a light on the phonetic value of the Mycenaean. Reviewing the results arrived at, Mr. Evans said that they had now before them two systems of primitive script—one pictographic, the other linear—both, as was shown by the collateral archæological evidence, belonging to the second thousand years before our era and to the days before the Phœnician alphabet had been introduced among the Greeks. The relations of these two forms of script to one another still needed elucidation, and they certainly overlapped one another chronologically. Some pictorial forms, however, of the one class clearly appeared in a linear form in the other, the double axe, for instance, being found in two stages of linearisation—the simpler form identical with the Cypriote character *le*. On the whole, the pictographic o

hieroglyphic series seemed more peculiarly indigenous to Crete, and the linear forms to be Mycenaean in the widest sense. The Eteocretans, or indigenous stock of the island, who preserved their language and nationality in the easternmost district of Crete to the borders of the historic period, certainly used these hieroglyphs. Mr. Evans gave reasons, based on his recent archaeological discoveries in Eastern Crete, for believing—that what had long been suspected on historic and linguistic grounds—that the Philistines, who, according to unanimous Hebrew tradition, came from the Mediterranean islands, and who were often actually called Krethi in the Bible, in fact represented this old indigenous Cretan stock, and that they had here the relics and the writing of “the Philistines at home.” In Egyptian monuments these people, who came from the “islands of the sea,” were seen bearing tributary vases of forms which recurred on a whole series of engraved gems seen or collected by Mr. Evans in Eastern and Central Crete. Their dress, their peaked shoes, their long hair falling under their arms all reappeared on Cretan designs representing the inhabitants of the island in Mycenaean times. In view of these facts, Mr. Evans asked whether certain remarkable parallels observable between some of the Cretan pictographs and the earliest forms of Phœnician letters might not best explain themselves by this early Cretan colonisation of the Syrian coasts.

THE LATE JOSEPH BOULT.

A MEMBER of an old Liverpool family of repute and a gentleman whose name has long been associated with literary and artistic pursuits has passed away, says the *Liverpool Courier*. To the younger generation of Liverpool men, Mr. Joseph Boulton, who died at his residence in that city on the 9th inst., in his 77th year, might be little known, but not many years ago he exercised a great influence and spoke with considerable authority upon many matters of public interest. Possibly on some of the subjects he discussed his views were regarded as advanced and even impracticable; his manner of expressing his opinions was not always of the most happy character; like other men of ability, he at times could ill brook opposition, particularly if he considered it was the outcome of prejudice or ill-formed thought; but his sincerity was never questioned, and when he took any question up he followed it with a vigour and persistency which even those who differed from him were compelled to admire. He was a ready speaker, apt debater and a fluent writer, and these capacities made Mr. Boulton a foremost figure years ago in local learned society, and he could hold his position in recondite discussions when participated in by such cultured men as Sir James Picton, Frank Howard, Louis Hornblower, Ginsburg, Weightman, Nevins, Moore, Mayer and others. Physical troubles impelled him to withdraw from the active studies and scientific pursuits that for many years engrossed his life, but up to the last his keen analytical intellect closely followed the varied developments of science and art as they arose. Did he not in recent times design a scheme for meeting the growth of the Atlantic passenger trade by providing protected berths near the river wall at the north end, with a railway to the landing-place and hotel convenient? His ideas developed no further than plans, but these showed that the designer had intelligent views of the necessities of the situation. Some of his older associates who still remain recollect his charming conversational powers, his facility as an essayist and fluency as a speaker, and above all that kindness which was always ready with encouragement and help for those who might be in need of it. Although recently retired from active public life, the death of this kindly cultured gentleman will be heard of with sorrow by all who knew him or were acquainted with his merits.

Mr. Boulton belonged to a notable Liverpool family, the members of which have for many years taken an active part in mercantile, municipal and learned life of the city. Some of them have been distinguished as public speakers, as writers, and as the organisers and heads of some of the great commercial undertakings of Liverpool. The deceased was the youngest son of the late Mr. Francis Boulton, a well-known Liverpool merchant, who died in 1848. One of his relatives, Mr. Swinton Boulton, founded and for many years managed one of the greatest insurance undertakings in the world—the Liverpool, London and Globe Insurance Company; and Mr. Francis Boulton, for many years prominently engaged in the American and Australian trade, was the founder of the Financial Reform Association, and was connected in commerce and public affairs with Robertson Gladstone, Lawrence Heyworth, C. E. Rawlins, Charles Holland, and other leading merchants of that period. Mr. Joseph Boulton possessed all the energy and public spirit of his race, and whatever he undertook, whether of a public, private or artistic character, he carried out with characteristic thoroughness. Originally intended for mercantile pursuits, the bent of his mind was directed to art. At an early age he was articled to a Liverpool architect, and soon obtained a reputation for aptitude and

careful study of questions affecting his profession. He visited all the principal cities of the Continent, and was familiar with the architectural details of some of the most famous edifices in the world, and could communicate his knowledge in brilliant language of artistic and architectural beauties that had engaged his attention. Few men were more familiar with the different peculiarities of the different schools of architecture, ancient or modern, than Mr. Joseph Boulton. He could discuss them with learning and describe them in a practical and popular way. He also had an intimate acquaintance with the great engineering and architectural works of modern times, and this knowledge was used by him with advantage during his long professional career. His ability and learning were recognised by his professional brethren on more than one occasion. He was a Fellow of the Royal Institute of British Architects and a member of various learned societies. Among the local bodies with which his name was connected were the Liverpool Architectural, the Philomathic, the Literary and Philosophical Societies and others. He occupied the presidential chair of the Architectural Society, and at different times read many important papers bearing upon architecture, sanitary science and art. During the erection of the new Exchange buildings, Liverpool, he was selected by that distinguished architect, Mr. Wyatt, of London, who designed the structure, to be superintendent architect in the carrying out of the work. This important function he discharged with ability and conscientiousness, obtaining the approval of his principal and the proprietors of the Exchange. To his death he remained the consulting architect of the Exchange Company, and for years had practical control of the company's buildings. His other work was chiefly in connection with sanitary undertakings, but he was also consulted in various important and local architectural matters, and his wisdom and experience, guided by a cultured, artistic taste, gave exceptional weight to his opinions, while his high personal character obtained for him the respect of all who knew him.

The Silent Flush-out Closet.

SIR,—Can you tell us who are the makers of a closet bearing the following inscription:—“The Silent Flush-out Closet, with Patent Fan, 1885, '86, '88?” “IRON.”

GENERAL.

Crowborough Church is to be restored under the direction of Mr. M. B. Teulon.

The Board of Manufactures have come to the conclusion that it will be necessary to discontinue the opening of the National Gallery, Edinburgh, on Saturday evenings during the dark months of the year, in consequence of the very serious injury to the pictures by the fumes from the gas. Apparently the Board have yet to learn that electric lighting is an actuality and can be employed in picture galleries.

The Board of the Liverpool School of Agriculture and Applied Arts will appoint an instructor in sculpture and modelling at 250*l.* a year, and one in decorative and figure painting at 150*l.* a year (each to have a two-thirds share of fees), besides craftsmen to teach wood-carving, wrought-iron work, and brass and copper-work, the salary of each being 45*l.* a year.

Mr. C. E. Lees, who presented the Oldham Art Gallery with pictures of the value of over 30,000*l.*, died near that town on Saturday.

Mr. Reuben Farley, the mayor of West Bromwich, has purchased the old Oak House, which dates from the sixteenth century, and has offered it as a gift to the borough.

Mr. Vicat Cole, R.A., is at present at Bolton Abbey, engaged on another view of that landscape.

A Petition for the grant of a supplementary charter has been presented by the Royal Scottish Academy. Petitions for or against the grant are to be sent in to the Privy Council Office before September 12.

The Design by Mr. R. G. Thomas, of Menai Bridge, has been selected in the competition for the New Welsh Calvinistic Methodist Chapel at Llangefni, Anglesey.

The Foundation-stone of the Verdin Technical Institute has been laid. The architects are Messrs. Woodhouse & Willoughby.

The Restoration of the tower and spire of St. Leonard's, Thryberg, near Rotherham, is about to be undertaken under the direction of Mr. Hodgson Fowler, F.S.A.

The Hastings School Board have arranged to borrow 5,350*l.* for the erection of the Bo-Peep School.

The Architect.

THE WEEK.

THE late Mr. WYATT PAPWORTH was so disinterested in his labours to increase the knowledge of architectural history, there can be only regret for his death on Sunday last. He died at the Soane Museum, of which he was the worthy curator for a brief period, during which he tried to make it more useful than it had been in preceding years. Mr. WYATT PAPWORTH belonged to a family that was long associated with the arts. He possessed sufficient ability to gain a prominent position as a practising architect. But the materials with which he preferred to work were books and manuscripts, and he undertook inquiries which needed more than the leisure hours of a life. When the Dictionary of Architecture was started his collections formed an important part of the literary capital of the venture. His aid was also to be relied on by all the contributors. But in a short time it became evident that if there was to be a Dictionary Mr. WYATT PAPWORTH would have to compile the greater part of the pages. He performed his onerous task as well as he could, but more was required in a work of the kind than he could furnish. From his connection with the Dictionary he was supposed to be competent to edit GWILT's "Encyclopædia." In this case also Mr. WYATT PAPWORTH was hampered by circumstances. The changes he made in successive editions are evidence of the difficulty of his task. Objections to its character have been raised from time to time, but it is well to remember that the big volume continues to be useful, and it is not likely to be superseded. The companion work on civil engineering has become obsolete, and without Mr. WYATT PAPWORTH's tact and industry "GWILT" must have shared that fate. In his various papers he has collected interesting information which will save trouble to future inquirers. His life could not be called prosperous in the ordinary sense of the term, but he rendered more services to architecture than men who gained greater prominence in the eyes of the world, and in the harbour of refuge which was opened to him he was likely to find means to confer further benefits on his brethren.

THE condition of the pictures in the National Gallery and the remedies for the decay are still subjects for controversy. Sir J. D. LINTON and Mr. J. ORROCK attributed the evil to the excessive dryness of the atmosphere, and proposed the introduction of water-troughs. Sir J. C. ROBINSON, who has charge of the Royal collection, doubts if much evil actually results from the fluctuation of temperature in public galleries. In Buckingham Palace there are no abnormal fluctuations, yet WILKIE's pictures have been cracked. Mr. ARTHUR KAY, of Glasgow, considers the English climate is moist enough already, and does not need the addition of water-troughs. He says that damp affects pictures on canvas most seriously, and in a part that is frequently overlooked, viz. the back of the canvas itself. Any moisture in the air which can reach the back of pictures, particularly by causing the walls to "sweat," is most destructive. The vegetable fibre in canvas readily and rapidly absorbs moisture, and this causes contraction of the fibres. Mr. KAY believes that a valuable picture was damaged in London some years ago by the custodian opening a window near it for a few minutes on a foggy day; and he has seen pictures ruined by being rubbed with a damp cloth. Atmospheric moisture is not less inimical to art than ingeniously christened and copal "faked" old masters. Mr. KAY's remedies are pure air, the electric light, an even temperature and protection of the canvas from moisture on the back (and in smoky towns on the front) to preserve pictures. But he holds that the bituminous works of British artists will be short-lived, in spite of anything restorers or water-troughs can do; and art lovers should avoid works containing this attractive but perishable pigment. The artist who would build a lasting memorial must give careful thought both to what he paints on and what he paints with. The painter

who uses perishable pigments is as one who carves his own monument in sand. Mr. E. R. ROBSON considers it is imperatively necessary at the National Gallery to admit fresh air to all the rooms in much larger volume than is ever thought of, to filter it from dust and dirt at its entrance, to moisten it sufficiently to compensate for the abnormal dryness otherwise arising from heating by hot-water pipes, and finally to exhaust it thoroughly and continuously.

ALTHOUGH the subject of education can have little interest for the House of Commons at the close of a session, Mr. ACLAND was able on Tuesday to offer a statement that was not unsatisfactory. He announced that he was endeavouring to get rid of the military officers who as inspectors are the tools of the officials at South Kensington, and to substitute "a younger and a really intelligent class of inspectors who will be able to carry on the work of the Science and Art Department more on the lines of the best work of Whitehall." It is an advantage to have any sort of check on the South Kensington rule, but much more is required than a game of see-saw between two sets of officials. Who can guarantee that Whitehall will not eventually have to go under? The efforts to improve the denominational school buildings have been successful. Although attempts were made by committees to pose as Christian martyrs because they were asked to make the schools less dangerous, the good sense of the country supported Mr. ACLAND. The appointment of an itinerant architectural adviser to explain requirements has been advantageous. If architects were called in by the managers there would be no need for the new official, but it was supposed to be policy to avoid the ordinary way of meeting the obligations. The demand for drain pipes, ventilators, dry buildings, playgrounds and the like was assumed to be an attack on doctrine which it was a duty to resist. That the children could have any claims was not admitted. But in spite of all the allegations of tyranny the committee of the National Society have had to own that no undue pressure was exercised by the Education Office, and when the condition of many of the buildings is borne in mind, we are surprised so much tolerance was shown to perverse managers who were ready to sacrifice the health of children so long.

How slight a cause can determine a competition has just been exemplified in Sheffield. The School Board invited architects to submit plans for the Tinsley Park School. In the instructions the words "must" and "should" were sometimes used as equivalents. While some competitors considered they were bound to follow the conditions literally, others interpreted them as conferring more or less liberty. The accepted design, which was marked "Sangler Rouge," contained three infants' classrooms, which the majority of the competitors contended were less than the number suggested by the conditions. Their protest was supported by the Sheffield Society of Architects, as will be seen from the correspondence in another column. At the meeting of the School Board it was admitted that the instructions were not sufficiently explicit, and in future cases it was suggested that imperative conditions should be separated from those which were only suggestive. It is not creditable for a School Board to be compelled to confess that they are incompetent to draw up a few instructions which everybody can understand. The successful competitors may deserve the encomiums they received for interpreting the document not as it was expressed, but according to its hidden meaning. The design probably merits selection, and we are not going to say one word against it. But we think that cases which involve the expenditure of a large sum of money should not be made occasions for offering riddles. The Board in their visits to their schools may sharpen the wits of the children by proposing verbal puzzles, but architects who spend time and money with only a slight chance of a return should be spared a mental exercise of that kind. However, it is only one among several instances which reveal the slight esteem which the public bodies of Sheffield have for local architects, and for which there may be reasons that are not revealed.

WATER SUPPLY OF TOWNS.*

LAST week we noticed a book by an English engineer who is a Professor in Sydney. To-day is the turn of one by another Englishman, the Professor of Sanitary Engineering in the Imperial University, Tokyo, Japan. The volume on construction in iron and steel will have to seek approval among a crowd of rivals, for the subject has a sort of attraction, and some men are more curious to discover whether a new treatment of it is practicable than to expect information. The subject of water supply has received much less attention. For years it might be supposed to be the Cinderella of civil engineering. The neglect was not due, however, either to the lack of importance in the subject or to its unprofitable character. It arose rather out of the incompetence of Parliament as a high court of science. Waterworks could not be carried out without an Act, and the process of obtaining one created a monopoly. Thirty years ago all works of the kind were in the hands of three or four engineers. If an outsider prepared plans for a new water supply he could not expect to gain approval for them unless he was supported by one of the very few specialists. The tactics of the opponents were almost of a stereotyped kind. Suppose the Bill came before a committee of the Lords. After the engineer gave his evidence, the cross-examining counsel would begin by asking him to describe his experience in the construction of waterworks. Although he might have been engaged in engineering works during many years, it was likely that he did not attempt to break down the BATEMAN HAWKSLEY monopoly at an earlier time. The witness would therefore attempt to explain that the proposed works corresponded in a great measure with those he had carried out. Counsel would then insist on a plain answer, a yes or a no, to his own most simple question. The witness would be compelled to own that he had not constructed waterworks. Then would come abundant abuse of the engineer for having dared to come before the noble Lords as if he were a competent man in order to give evidence, and it would appear as if a crime had been committed by which the severest penalties of traitors were incurred.

Only in a parliamentary committee-room is it possible to realise the awful consequences which follow the slightest departure from procedure. An error in drawing a line on one of the wall-maps can be made to appear as an attempt to upset the constitution. An engineer in the position we have described might expect to hear that the preamble of the Bill was not proved. The tactics did not originate with waterworks. When railway schemes were started efforts were made to overthrow GEORGE STEPHENSON on the ground that he was without experience, and when his son designed the Britannia Bridge he was obliged to propose the use of chains for holding up the beams in order to lessen the apprehensions of the parliamentary committee, because he had not spent his life in the construction of tubular bridges. How long the old prejudices can survive was seen in the case of the Liverpool Waterworks. The Corporation were compelled to allow Mr. HAWKSLEY to take the most prominent part in the committee-rooms, although there was no intention to retain his services when the Bill had passed. The designer of the works, and who was to assume all the responsibility for their success, in the proceedings before Parliament appeared of little account. The people of Liverpool were, in fact, compelled to pay a large sum to bamboozle legislators to whom plans were mysteries.

Fortunately for sanitation the barriers of the most narrow of professional circles have been broken down. Waterworks are no longer believed, either in or out of Parliament, to be the most difficult of all branches of engineering. In consequence, the number of men who can take a professional interest in the subject is increased, and we may expect that many books will be forthcoming for their benefit. Messrs. CROSBY LOCKWOOD & SON, who brought out books on subjects connected with hydraulics at a time when, thanks to Parliament, students were not numerous, have enriched their collection with a comprehensive volume by Mr. W. K. BURTON. The author

does not restrict himself to his own works. His book exemplifies the latest practice, and will serve as a guide to novices, while it can be very often suggestive to engineers in practice.

The discovery of a source of supply is attainable only by acquaintance with the peculiarities of a gathering ground. Nature has occasionally provided natural reservoirs like Loch Katrine, Thirlmere, Lake Vyrnwy, &c., but in the majority of cases supplies have to be derived from sources which to ordinary eyes appear most inadequate. In England the data which Mr. SYMONS has acquired are invaluable in suggesting the probable rainfall of a district, and much of the late Mr. HAWKSLEY's success was due to the accumulation of similar information. But cases are constantly arising where statistics are at variance with the condition of a district. One is related by Mr. E. EASTON as occurring near Brighton. We are told how "he observed that over a large area of ground near that town no stream of any kind was to be seen. He also noticed that along the seashore there were, especially at low water, innumerable rills of water passing through the sand, and he found that this was fresh water, the fact being that the ground is so porous that the rain all soaks into it, and makes its way underground to the sea. In this case by driving a tunnel parallel with the seashore, and at the depth of low water, a plentiful supply of fresh water was obtained." Many other cases could be given of supplies that were derived from places which appeared to be as unyielding as the rock struck by MOSES. The engineer acts on the belief that the greater quantity of rainfall is not evaporated, and his business is to discover where it is concealed. In this country it is well to remember that the underground stores of water go through a process of natural filtration, and consequently the Rivers Pollution Commissioners were not afraid to declare that among the varieties of potable water the best for dietetic purposes are spring and well water. With the means that are now available for boring and pumping, supplies of that kind are easily obtained.

One of the objections to underground supplies arises from the uncertainty of discovering the quantity that is obtainable. It is easy to calculate the delivery in a certain number of hours or days, and to assume that the yield will go on for ever as abundantly. But public authorities who have more than a financial interest in a supply can hardly be satisfied without reservoirs which will afford an ample provision for many days. Formerly it was considered that public granaries were indispensable. Railways and steam vessels have made them unnecessary, but it would be absurd to rely on foreign sources for water. Climatic variations have affected the calculations which used to be adopted for determining the capacity of the reservoirs. Last year it was necessary to consider whether restrictions should not be imposed in Glasgow, which was supposed to possess an excessive supply in the Highlands. In Dublin there was a panic when it was found the great reservoirs were running dry; that is, in a country where rain is supposed to fall every day. The Vyrnwy reservoir has an area of 1,120 acres, or three times the area of Hyde Park, and yet doubts have been raised about its sufficiency to meet the needs of Liverpool in the future. A two months' supply is now considered to be necessary for all large towns if emergencies are to be provided for.

In a populous district the existence of an artificial lake or reservoir of large area often excites apprehensions of danger. When dams or embankments burst in England the consequences are serious. Whatever the material, clay and puddle or masonry, there must be quantity as well as quality in the work. The Americans, who take a pleasure in defying contingencies, are as economical in their embankments as in their steel bridges. But with them insurance can compensate for constructive freaks. The dam 270 feet high, which was proposed in connection with the water-supply of New York, would probably find its warmest supporters among the insurance agents. During the construction of a big dam an engineer has an anxious time, and especially in the East, where he has only native workmen at command. Mr. BURTON mentions that for the Hong Kong waterworks, Mr. DRANGE, the engineer, "finding Chinese masons untrustworthy or unable to do a style of work of the excellence necessary for masonry dams, constructed a con-

* *The Water Supply of Towns and the Construction of Waterworks.* A Practical Treatise by W. K. Burton, C.E. London: Crosby Lockwood & Son.

siderable dam entirely of rubble concrete with a cut-stone facing." The dam is over a hundred feet high, and varies in width from 76 feet 6 inches at the foundation-block to 23 feet 6 inches at the top. A case of this kind suggests the advantage of having the responsible engineer on the spot. If the work had been carried out according to directions from one of the offices in Great George Street it would probably have succumbed under pressure.

The discovery of the prevalence of microbes is not without effect on the arrangements for filtering, and may lead to a change in the arrangement of the beds. Dr. KOCH, of Berlin, considers that the process should take a long time, and he recommends a speed of $7\frac{3}{4}$ feet in twenty-four hours as the utmost. But, as Mr. BURTON remarks, there cannot be any hard-and-fast rule applicable to all cases, for much will depend on the condition of the water, the character of the sand, &c. He considers that a maximum filtering speed of 10 feet in twenty-four hours is quite permissible. The cleaning of the beds, or rather the upper layer of sand, should be undertaken at intervals of about ten days. The process in some places is less urgent, for at one of the works in Japan "water has been passing through a set of filter-beds for several years without their having been cleaned or showing any approaching need of cleaning." Besides filtering, water may require to be purified and softened. In connection with this important work the use of spongy iron as devised by Dr. WILLIAM ANDERSON has produced a marvellous result in Antwerp at a small expense, and is likely to produce a revolution in waterworks unless the conservatism of the resident and consulting engineers impedes improvement.

The care of the engineer is far from ending when he has insured a sufficient supply of purified water. Difficult duties arise in connection with the service reservoirs and the multitude of details belonging to distribution. In all these cases, happily for himself, he has the skill of many practical men to aid him. Mr. BURTON frankly says, "Any engineer who takes up waterworks practice will naturally provide himself with a collection of the catalogues of the well-known manufacturers whose specialty it is to provide fittings for waterworks, and from these he will get a very good idea of the numerous minor fittings." It is more honest to reveal obligations in that way than to pretend to be the creator of every appliance. In the same spirit Mr. BURTON suggests that it is wiser and more economical to trust to the manufacturer than to be inventive or over-precise in prescribing qualities which are only shams, as when he says in his remarks on specifications:—

There is something to be said for specifying merely the working pressures and the test pressures that the pipes will be subjected to, allowing the pipe founder to fill in the thicknesses and weights. The reason is that some pipe founders prefer to use iron of greater tensile strength than others, reducing the thickness of the pipes accordingly. In such a case the engineer, in considering tenders, must be careful to observe that the thickness is really sufficient for safety, and that an unscrupulous tenderer has not reduced the thickness of pipes to a dangerous degree in hopes that, by the reduction in price he can thereby allow, he may get the contract. There is a good deal to be said, too, for allowing the tenderer to tender for the form of socket that he has been in the custom of making. A pipe founder is just as likely to know a good form of socket from a bad as most engineers, and we may be sure that, in the case of a pipe foundry, if the routine of the establishment has to be altered, the alteration has to be paid for. Any pipe founder can quote a lower price for a pipe of the form he has been accustomed to cast than one of a new form, at any rate, unless the quantities to be turned out be very large.

These words suggest the advantage derived by civil engineers from their technical skill, which enables them not only to appreciate the efforts of manufacturers but their honesty also. As both classes of men interchange their offices and meet on the same footing in the great Institution, they have a common respect for efficiency. The words are also suggestive of the character of Mr. BURTON's book. He does not write as a theorist, but as an engineer who has gained knowledge by experience, and who is eager to make the way easy for students and others who will have to undertake responsibilities like his own. He therefore departs from the usual plan adopted for books of the class, and avoids creating those difficulties which rarely arise. Every page has a relation to realities and imparts the knowledge which will hold good in working.

Mr. BURTON hopes that his work may prove of special interest as well as utility to Japanese students. Japan,

which at the present time has contrived to attract universal attention—and so big an advertisement is worth much to a commercial country—appears to be as eager about hydraulics as about military affairs. The expectation of a diminution of the number of fires is an incentive to costly works. It cannot be said they are solely inspired by a desire to imitate Europeans. Mr. BURTON says, "There can be no doubt that from the time, nearly three centuries ago, that Tokyo, the capital of Japan, was supplied with water by the Tamagawa canal, supplemented by a complete system of ingenious wooden pipes of square section, till about the beginning of this century, it had a better supply of water than either London or Paris, or probably any town in Europe of which the natural supply was not exceptionally good." If compared with Europe, the country may be said to have advantages as well as disadvantages. As in other parts of the East, the "paddy" water that runs off fields contaminates streams. But the worst enemy is the earthquake. From the following passage it would appear that the remote effects of the disturbances can be serious:—

On the occasion of the great earthquake of 1891 in Japan, a strong partition wall of the service reservoir of the Yokohama Waterworks, some 200 miles distant from the origin of the disturbance, was overturned by the lashing backwards and forwards of the water, although the reservoir was not otherwise damaged. Even the water in a small rectangular reservoir of the waterworks of the Imperial University of Japan (size 82 feet by 25 feet by 20 feet deep) was thrown into waves about 3 feet high, and these effects were at places where the earthquake was but slightly felt. What would have been the fate of a large impounding reservoir had there been one in the part of the country most disturbed, it is impossible to say. Only two observations are to be made. The writer has not heard of the bursting, at the time of earthquakes, of any of the small reservoirs with earthwork dams made by farmers to store water for irrigation. And, further, if every engineering structure had to be made so that it would stand such shaking as that at the worst of the great earthquake of 1891; no engineering structures would be made in Japan at all, nay, no structures of any kind, for what will stand when the very mountains are riven and partly overturned?

Elasticity is to be desired in the structures set up in earthquake countries, and from the absence of that quality concrete does not appear to be applicable as a material for reservoirs. Water towers are also risky, and where tanks must be elevated wrought-iron supports are the safest. Mr. BURTON has been able to obtain valuable suggestions on the subject of construction in countries liable to earthquakes from Professor JOHN MILNE, F.R.S., who holds the foremost place among students of seismological phenomena. The following passage will suggest the precautions that have been taken in various countries:—

In making foundations, experiment and experience have shown that great advantages result from allowing the building to rise from a basement with an open area surrounding it, the motion at a distance, removed from the origin of a disturbance, being not unlike that of water waves, the amplitude of motion of which is less beneath the surface than it is on the surface. Regulations in certain parts of Italy respecting buildings require that, when they are erected on soft ground, the foundations should consist of a platform of masonry or concrete, to extend from 3 feet 2 inches to 4 feet 9 inches in every direction beyond the base of the building, the platform itself being, for a one-storey building, 2·3 feet thick, and for a two-storey building 3·91 feet thick. In Japan several buildings have been erected on what are called "free foundations"; that is to say, the buildings are carried on a layer of shot or iron balls. On account of the movement experienced at the time of high winds, and also for other reasons, such construction is not to be recommended.

Another principle of great importance which is not to be neglected when designing high structures is that the stresses arising out of earthquake motion, that have to be contended against, are to a large extent applied horizontally. For example, ordinary archwork is condemned in Italy, Manilla and other places where earthquakes are frequent, as being unsafe. In Ischia it is allowed underground, where the motion is less than on the surface; even in this case it is specified that the arches have a rise of one third of their span, and that the minimum thickness of the crown shall be 0·82 foot (one brick) thick. The height to which walls are allowed to be carried in the Island of Ischia for two-storeyed buildings is 32·8 feet. Walls of 13 feet high, constructed of simple masonry, must have a thickness of not less than 2·3 feet.

The interest belonging to information of the kind we have extracted should be enough to suggest the advantage of local knowledge when waterworks are proposed.

A Picture by William Dyce, R.A., representing St. John leading home the Virgin Mary from the Sepulchre, exhibited at the Royal Academy in 1860, has been presented to the National Gallery, and is hung in Room XIX. The donor wishes to remain anonymous.

ENGLISH WATER-COLOUR ART.

THE Whitworth Institute in Manchester is suggestive of science, and especially of a place devoted to demonstrating that science is measurement. Somehow art has gained a footing in it. The committee probably were not long before they discovered that science cannot become alluring to artisans. It was resolved to provide "for the collection, exhibition and illustration of works of fine art in various departments, and for their historical and æsthetic study." Out of the surplus from the Jubilee Exhibition sums amounting to 45,000*l.* were allotted to the Institute, 20,000*l.* being for the purchase of works of art. Afterwards the schools were made over to the Corporation, and the committee were free to realise and develop their resolution concerning art. They commenced to purchase examples. Donations came to them. Mr. WATTS, R.A., generously presented his *Love and Death*, for which he had refused a large sum. Mr. J. E. TAYLOR gave 4 oil-paintings, 154 water-colour drawings, and 127 drawings by W. MULREADY, R.A. Other gifts followed. Mr. HORSFALL bestowed 500*l.* for the purchase of water-colour drawings, having places within thirty miles of Manchester for subjects. Unfortunately there is not as yet a suitable building for exhibiting the collections. They have been placed in a small house in Whitworth Park, where a great many people seek them. Galleries will, however, be erected.

In order to increase the usefulness of the collection a catalogue has been brought out in two editions, one very cheap, the other more costly on account of its size and illustrations. The introduction and biographical sketches by Mr. MONKHOUSE and Mr. BANFIELD, the curator, supply the information which is likely to be desired by the ordinary visitor, and will enable a mechanic to appreciate the value of drawings that will appear childish efforts if compared with the oleographs he sees in the shop windows or in his own house.

The collection of the Whitworth Institute is of undoubted value as exemplifying the progress of water-colour art in England. The earliest is a drawing in sanguine by HOGARTH, which corresponds in treatment with his *Garrick as Richard III.*, which is more modern than most of the satirist's works, for it corresponds with what is still seen in the performance of the play, or at least on the provincial stage. HOGARTH could express his thoughts more vigorously in oils or on a copper-plate than by water-colours, and the sketch in the Institute seems to be intended for some temporary purpose. A drawing of Richmond by WILLIAM TAVENER belonged to PAUL SANDBY. Although the work of an amateur it has a historic value, for it is evidence the art was practised in a modest way in the first quarter of the eighteenth century, and who can say TAVENER was the only proctor who attempted to represent the beauties of Sheen? By a contemporary, SAMUEL SCOTT, who was an able marine painter and has left a vigorous view of London Bridge and other sights of London, is a view of Twickenham. It is strange that the half-savage blood of PETER THE GREAT was destined to be an influence, for his son, ALEXANDER COZENS, made the art popular by adapting it to the capacities of fashionable people, and his grandson JOHN R. COZENS was described by CONSTABLE as the greatest genius that ever touched landscape. The elder artist is represented by a view near Chamouni, the other by five Italian views.

There are drawings by several other eighteenth-century artists, which are worth attention as indications of the slow progress of the art, such as THOMAS and PAUL SANDBY, DOMINIC SERRES, WILLIAM HEBERT, POUNCY, W. MARLOW, NICHOLAS POCOCK, WILLIAM PARS, MICHEL ANGELO ROOKER, T. HEARNE, R. CLEVELLEY, F. WHEATLEY, T. MALTON (the Young Painter's Maulstick), who was one of TURNER's teachers, J. SANDERS, SAMUEL ALKEN, ATKINS, J. I. RICHARDS and F. NICHOLSON. There are three of STOTHARD's book illustrations, which are far more charming than many of the ambitious drawings which are now produced, and it must be said that full justice has not been rendered to the artist as a water-colour draughtsman. There are drawings by him in the British Museum which are marvels of execution. FLAXMAN is also rightly assigned a place in the collection, although, as a religious man, he

would not be flattered by his proximity to ROWLANDSON in the catalogue. BLAKE would have as much right to be shocked, but the recluse of Fountain Court would be more merciful than the sculptor in his judgments. There are seven of BLAKE's drawings of innocence to which no academic rule can be applied.

WILLIAM PAYNE's *Cromer* and all genuine works by him merit respect on account of his efforts to improve the technique of the art. Before his time it was easy to perceive the influence of the aquatint engraver. Colour was only a supplement to line-work, and washes were laid on so thinly they could not be expressive without the aid of more or less pen sketching. The water-colour draughtsman seemed to be akin to the print-colourist. PAYNE attempted to go further by more gradation of colour, deepening his foregrounds, and wiping out or erasing colour to express light by the whiteness of the paper. His use of gum was derived from the print-colourists, but they would not have ventured to bring out effects of sunshine by a sort of glazing of gamboge and lake. W. S. GILPIN, the first president of the old Water-Colour Society, was a genuine lover of landscape, and his *Carnarvon Castle* merits a good position. AUGUSTUS PUGIN was as influential as any of the artists, for he was a pioneer in the representation of the life of his time, and he helped to make people admire Mediæval remains. There are views of Lincoln Cathedral and Oxford by him, but they are not the most trustworthy of his drawings. DAVES, S. HOWITT, J. CRISTALL (whose portrait is still preserved in the Water-Colour Society), and JOHN GLOVER, who was the first artist that emigrated to Australia, are "representative men." GEORGE BARRET, who endeavoured to be classical without being conventional, SAMUEL OWEN, the marine painter, THOMAS BARKER, of Bath, H. EDWARDS, ROBERT HILLS the *animalier*, WILLIAM DANIELL, W. H. PYNE, who preserved many traditions about English art and literature, P. S. MUNN, J. A. ATKINSON, the unfortunate R. R. REINAGLE and Mr. E. THOMAS, the architect, carry on the roll until it meets the name of TURNER.

The unaided productivity of TURNER can never be credited until all his works are brought together, a consummation which, however devoutly to be wished, is never likely to be realised. That so much has been preserved is one of the miracles of life. The Whitworth Institute possesses no less than forty-two drawings, mostly exemplifying his early periods. In many of them his reverence for architecture is visible. The old bridge at Shrewsbury, with its intrados made up of a series of different curves, the buildings on the parapet, which are held together by timber beams, and the new bridge in process of construction with its braced centering, reveal the treatment by an artist who endeavoured to understand whatever he was obliged to represent. The *Interior of the Salisbury Chapter-house* is evidence that TURNER understood the characteristics of styles as well as any MILNER, DALLAWAY or RICKMAN. How admirably THOMAS GIRTIN could represent buildings is proved by his *Durham* and *Tattersall Castle*, and, unlike his more famous companion, he had the courage to suggest that architectural masses were made up by pretty elements, such as stones, bricks and slates. There is one view by JOHN CONSTABLE—*Fearing Church, Kelvedon*—but oil-colours were better suited to his mind and hand. One of J. M. WRIGHT's pretty drawings, so well adapted for the old Annuals, *A Scene from "The Winter's Tale,"* has been obtained.

The view of the Rye House by CLARENDON SMITH exemplifies the skill in drawing which was possessed by the old topographical engravers. By JOHN VARLEY are views of Carisbrooke and Bala, which are useful for students on account of the skill seen in the composition. Sir A. W. CALCOTT was a still stronger master in the arrangement of the parts of a landscape-drawing, but his works have not received the appreciation they deserve. He is judged as the painter of *Raphael and the Fornarina*, and as such he must be condemned. The two drawings in the Whitworth Institute, *A River Scene with Shipping*, and *The Pool below London Bridge*, are good specimens of his style; but an effort should be made to acquire one of his Italian views, or better still would be one of the Dutch scenes. A. E. CHALON was born in Geneva, and it would be well if all claims to him on account of long residence in England were

abandoned, and he was made over to the Swiss or any other country that is not particular about the work of its celebrities. That applauded men of his class were not able to debase English art testifies to its soundness. LUKE CLENNELL was a pupil of BEWICK, and was one of the most skilful woodcutters of his time. He was not satisfied with reproducing other men's drawings. His *Battle of Waterloo* is the most effective representation of the final scene, and the print from it is popular. The drawing of a *Bridge over a Stream, Scotland*, denotes his skill in landscape. CLENNELL collapsed before he reached his fortieth year, and he had not then attained his full strength; still, he is worth a dozen CHALONS. Neither FRANCIS STEVENS nor WILLIAM WESTALL did much to advance landscape art, but JOHN SELL COTMAN was a master who, although amateurs were neglectful of him, found an exceeding great reward in his power to represent nature. The drawings *Dutch Vessels off the Isle of Wight*, *Off Portsmouth*, *Wreckage in a Rough Sea* and *On the River Sarthe* only partially express his competence, and it would be well to obtain some of his views on land and architectural subjects while they can be secured at a moderate price. Another worthy who did not find much favour from patrons was WILLIAM HAVELL. By FREDERICK NASH there are two architectural views. The Institute was fortunate in obtaining four of SAMUEL PROUT'S architectural drawings from the guarantors of the Jubilee Exhibition, and a coast scene by him was purchased last year. There are also five drawings by DAVID COX, whose manly treatment we hope will serve as a corrective to students who show a tendency to the prettiness which is now admired.

WILLIAM SCOTT, who died in 1850, is almost forgotten. His *Severn Valley* is skilful. Four of PETER DE WINT'S graceful drawings of riverside scenes have been secured, and one of the Trinity Chapel in Canterbury Cathedral, by JOHN CONEY, who was one of the ablest of the architectural draughtsmen. WILLIAM MULREADY'S sketches will afford many a lesson to students. He was not always engaged in collecting materials for pictures; up to the end of his life he found a solace in drawing, in the simplest things he found trials of strength, and the veteran was not ashamed to acknowledge how much he had to learn. If rightly used the sketches will be among the most valuable of Mr. TAYLOR'S gifts. There is as yet only one of COPLEY FIELDING'S drawings, *Boats entering Dover Harbour*. G. F. ROBSON, JOHN MARTIN, W. TURNER, G. S. SHEPHERD are also represented. No less than seven of WILLIAM HUNT'S were secured, and fortunately they reveal his genius under its various aspects. A view of Stcke Pogis Church is a memorial of the venerable architect, JOHN CHESSELL BUCKLER, who died a few months ago in his ninety-ninth year. A view of Edinburgh, which was prepared for the illustration of SCOTT'S novels by CLARKSON STANFIELD, and one of his sea-pieces, *The Wreck of the Avenger*, will be welcomed by all who admire the brave artist who fought his way through many difficulties, and remained the genial sailor to the end of his life. His friend DAVID ROBERTS was no less great in dealing with architecture, and he was able to impart a grandiose character to a village church. There are four drawings from his hand, three of them representing the Spanish subjects in which he was most successful. A view of Rotherham Church is by ORLANDO JEWITT, who helped to popularise architecture by his excellent woodcuts. Three of GEORGE CATTERMOLE'S drawings, one of JAMES HOLLAND'S, one of J. B. PYNE'S, two of FREDERICK TAYLER'S and two of GEORGE CHAMBERS'S have been presented by the guarantors of the Jubilee Exhibition.

Manchester does not include many artists among its "men," and therefore importance must be attached to *The Falconer* and the *Edie Ochiltree* by HENRY LIVERSEDGE, who, as the inscription in the Chorlton church records, "cultivated his innate love of painting in defiance of adverse circumstances and a weakly frame. Life was to him a school for the earnest study of his art in the subjects of romance and humour to which his genius inclined. Death overtook him as he passed from scholar into master." One of THOMAS ALLOM'S foreign scenes, *Houses in Adrianople*, *A Spanish Festa* by J. F. LEWIS, *The Gallery at Aston* by JOSEPH NASH, four drawings by WILLIAM MULLER, one by E. J. NIEMANN, two by A. G. VICKERS and one by

BONINGTON complete a collection which, with the aid of the catalogue, will enable students in Manchester to realise why the English school of water-colour art is the admiration of all the world.

DRAUGHTSMANSHIP v. ARCHITECTURE.

By P. MORLEY HORDER.

IF all our buildings were as realistically beautiful as they are represented, this might be a golden age of architecture. Time was when discretion in the choice of materials was less difficult, and the merits of simplicity and proportion in design were not marred by a multitude of ornamental features, devised with no regard to principle. It would be interesting to see the first studies for some of the most perfect of our ancient buildings and compare them with modern ones. One seems to see at once all that is crude in the way of drawing opposed to the greatest refinement of line and delicate shade; and yet one is probably based on the subtlest knowledge of rightly disposed masses, and the other the mere skilful counterpart of something already existent, with no special relation to the particular area of ground it is intended to beautify. One is to satisfy the designer as to the grouping of the different lines of his building; and is more for his own satisfaction; the other is to entice others into a belief in the final beauty of the proposed building. It is, in fact, the difference between the work of an artist who works primarily for the love of his art within the lines of circumstance laid down, and the mere professional employer catering for a public whose ignorance makes his task easy. There is then a serious danger in mere facility of draughtsmanship. Whilst it is a considerable, almost an assured, means of success in these days, it is in no sense the prime qualification of an architect. To the trained eye more certain signs of real beauty may be found in the crudest and yet studied elevation than in the most realistic perspective. If it could be borne in upon the public that beautiful architecture consisted of beautifully-disposed building material (that the only test of an architect's skill was in such actual and effective uses of the materials within his reach), rather than a multitude of useless features and materials, there would be less chance of their being allured by skilful drawings, or imagining that such must necessarily result in beautiful buildings. The subject of competitions has been worn to death; it seems a necessary evil of our time, and the grumbler at the system looks sadly like an incompetent miscreant. The competition race is certainly not as a rule to the instinctive designer, the result hinging almost entirely on the amount of skill shown in the drawings. To be successful you must know exactly the conventional methods considered correct—the result may even turn on the colour of your mounts. It has been urged in favour of these competitions that it gives young men with few chances opportunities of making a start; but I question whether the amount of labour and expense involved in a well-ordered competition is not prohibitive in most cases. Certainly it is hardly worth while a young man entering a large competition where so much turns on the splendour of the drawings presented. The impossibility of any fair adjudication on a series of architectural drawings in these days is quite obvious. The layman with any nice sense of architecture is the rarest exception, certainly in town councils and the like; whilst the introduction of an assessor as a final decisive factor has serious drawbacks from an outside point of view. Naturally a committee feels it knows best its actual requirements in the matter of arrangements, and the best design does not always accompany these. In fact, in the present chaotic state of architecture and the almost complete ignorance and indifference of the public generally about the subject, competition is an anomaly. Did the architectural body set any value on the dignity of its art it would try to organise a crusade against such a system—it would at least discountenance it through its leaders. In fact, if there were any real enthusiasm amongst its members it would create so strong a feeling amongst the Fellows of its body that they would one and all agree to put an end to so pernicious a system by refusing to compete again. Decisive action of this kind would do the profession infinitely more good than harm, and the public would be the first to approve. What is to take the place of the competition? will be asked. Our towns are glorified by their great buildings and their architecture should only be entrusted to those who have competently enriched the land elsewhere with beauty. Of course it will be urged that this leaves small opportunity for the aspirant to architectural honours. And yet there is every reason to suppose that a discerning public, taking so deep an interest in its material surroundings, would in time feel that the excellent quality that goes to produce or make effective buildings requiring the strictest economy of means, deserves larger scope for display. He should be one whose eye has been trained unerringly to make the simplest things proportional and beautiful, though he may know nothing of the Etruscans or their work!

TESSERÆ.

The Nomenclature of Mediæval Styles.

IN this country the predilection for the systematising of styles has been pursued with more assiduity than elsewhere, and one nomenclature has succeeded another with a rapidity that has rendered confusion worse confounded. One of the earliest and best attempts was that of Rickman; he divided our native art into four divisions—Norman, Early English or Lancet, Decorated and Perpendicular. From the last it has been found requisite to separate the Tudor, as a well-defined variety; and the acknowledgment of Saxon has, again, entitled that style to rank with the rest. We have here, therefore, three or four dynastic names, and as many technical ones. Latterly several attempts have been made to improve on this, but generally by getting rid of the dynastic names and substituting for them technical ones, derived either from the window tracery or some subordinate peculiarity which the names assigned always describe briefly, often incorrectly, and after all convey no information. The terms Saxon, Norman, Tudor, Elizabethan and such like, however, maintain their ground, and a far more philosophical course would be to extend these, leaving the technical names merely as descriptive affixes. Thus, English architecture might be divided into Saxon, Norman, Plantagenet, Edwardian, Lancastrian, Tudor and Elizabethan. Jacobean has been applied to the next variety, while that which follows, including the works of Inigo Jones and Wren, might be appropriately distinguished by the name of Stuart. Denominations of this sort admit of subdivisions to any extent. Thus the styles of the first, second or third Edwards are sufficiently distinct to require separate names, though no technical term could point out exactly in what the difference consists. Even the styles of the beginning and end of the long reign of Edward III. require to be distinguished, and can easily be by this form of nomenclature, but can by no other yet proposed. So with the four Georges, or the Stuarts, Lancastrian, Plantagenet, &c. The three Richards, by a singular coincidence, mark three ages of transition. Even without these adventitious advantages, a name so given marks the country and the age without fail, and describes the style with perfect correctness, without even suggesting the necessity of a system. Another mode of attaining the same end has been partially adopted by the French, by giving the date instead of the dynasty; thus they speak of their styles of the twelfth, thirteenth, or fourteenth centuries, and subdivide them into styles of the "first half," "second half," or commencement or middle of each of the centuries; a process as unobjectionable as the one above described, except in the circumlocution it requires, and the desirability of finding a single word if possible to express our meaning. Whichever of these two last systems it may be thought most expedient to adopt, the great desideratum is obtained of a title which shall in the first place express the country where the style was practised and is found, and secondly the age to which it belongs. A third or technical title may be added to characterise it, but this is always unnecessary to any one at all acquainted with the subject, for when the country and age are known, the style is far more clearly suggested than it could be by any technical term drawn from one of its peculiarities.

The Ownership of the Thames.

If Old Father Thames could be interrogated about the ownership of the river he would say that, though occurrences of upwards of a thousand years past were somewhat misty, his recollections were not quite obscured, and he would recall the time when the Romans under Maximus and Theodosius, aided by the tribute of the city of London, then a Roman municipium, embanked the river which divided the two great provinces, Britannia Prima and Flavia Cæsariensis. The government of the port and river remained under the municipal government of the Londoners until the Romans retired from the kingdom, and it was afterwards retained by the citizens as the boundary separating the Angles, who were settled north of the Thames as far as Caithness, and the Saxons who held the country south of the line of the river. During the Heptarchy the Corporation governed the Thames, and Edward the Confessor established courts of conservancy with ample powers secured by charter to the aldermen of London, whose station was recognised even before the kings of England had being. William the Conqueror at his advent exhibited considerable shrewdness in wishing to take possession of the river, but the Corporation evinced so determined an opposition that, desiring to be considered "friendly," as he termed it, he granted a short but comprehensive charter confirming, in general words, all the privileges granted by Edward the Confessor. This charter, very unlike the diplomatic notes, protocols, treaties, &c., of the present day, consisted of only a few lines, but although after an interval of eight hundred years its phraseology might appear somewhat obscure, it was at the time capable of being comprehended by the meanest capacity, and completely to the purpose. Many of the succeeding kings attempted to interfere with the govern-

ment of the river, but invariably met with the same successful rebuffs from the citizens. Favourites and courtiers, then as now the fruitful sources of evil, were equally unsuccessful in enforcing the grants illegally made to them; until at length, in the reign of James I., the citizens actually filed an information against the Crown to establish their rights, and Sir Edward Coke, the attorney-general, confessing the right of the Corporation based upon immemorial usage, judgment was entered up in the Court of Exchequer; but to make assurance doubly sure, the king recognised the right and confirmed it by a charter, which though annulled by *Quo warranto* in the Star Chamber, was confirmed with the other charters granted to the city by William III., whose plain common sense and feeling of justice recognised the evident rights of the Corporation to continue to be the conservators of the river which had been so long in their hands, and had been by them so ably administered.

The Position of Architecture among the Arts.

The function of sculpture is to represent, in solid material, the forms of natural objects or of geometrical combinations. In statuary, in the carved work on friezes and tympana, in the foliage of capitals, we have natural objects, and in mouldings, string-courses, twisted and clustered shafts and the like, we have a mixture of round, angular and elliptical forms. The more closely we adhere to original models the nearer we are to high art. Thus caricature is low art, and Hindoo and other oriental idols are usually works of low art, because they are mere distortions of the original figure of man, which should be shown as nature made it. Thus, too, the carved ornaments of savages are generally of a low character, although the talent and perseverance of the workman may produce individual specimens of great beauty. The further we go from reality the lower we get in the scale; and if we reject models altogether, we have no art left. If this proposition be disputed, let any man take a block of stone and hack it about at his pleasure with a chisel; if he resolves to make something entirely free from any natural or mathematical form, the world, with one consent, will call the result of his labours, not an original shape, but a shapeless mass. With painting it is pretty much the same thing. The ancient Briton who daubed himself all over with woad was not an artist, neither is the house-painter when he covers a whole room with uniform colour. But the South Sea Islander, with his delicate and regular tattooing, is an artist of an humble type, and so is the house-painter when he picks out the cornice with gold and pink, or makes any arrangement in which the aid of form is invoked to give birth to effect. A random dash of colour on a wall is not art; a shapeless rock painted or drawn may be art, but it is so merely because the mind has been exercised to produce on flat canvas an imitation of the rough and jagged thing that is found in nature. Hence sculpture and painting are essentially imitative arts; but the same reasoning does not seem to apply to architecture, or even to music.

Indian Architecture.

The history of Indian architecture commences not earlier than the middle of the third century before Christ, when Asoka made Buddhism the State religion of India, and sought to commemorate the fact, not only by inscriptions, but by monumental columns and other lasting memorials, some of which remain to our day. It then begins with a strong admixture of Grecian, or at least of Western art, as if the Indians were then first learning from foreigners an art they had not previously practised; but this extraneous element soon died out, and is not again to be traced, except perhaps in Cashmere, where it seems to have long remained in force. From the time of Asoka till nearly that of the Mohammedan conquest there exists no difficulty in tracing the whole history of Buddhist art, a complete series of examples existing in the caves and topes which, taken in connection with those of Afghanistan and Ceylon and other buildings, amply suffice to elucidate the subject. From that time to the present day we find abundance of examples in Burmah, Thibet and Nepal, which, with collateral illustrations from Java and elsewhere, enable us to trace the history of the Buddhist style through more than 2,000 years. There is every reason to believe that from the buildings themselves, and from the paintings and sculptures with which they are adorned, the whole history of this important sect may be restored with the utmost distinctness and certainty. In India this style was succeeded by that of the Jains, though this latter seems scarcely to have arisen out of the former, but to be the lineal descendant of some older style whose traces have not yet been detected further back than the ninth or tenth century, though some may probably still exist between India and the western parts of Asia. If the Jaina buildings want the manly vigour and boldness of the Buddhist style, they far surpass it in the elegance both of their combinations and of their details. In these respects the Jaina style surpasses any other style in India, and has had in consequence more influence on the Mohammedan art, and, through it, on the modern Hindoo, than any other, circumstances which would render its study singularly interesting had we the means available for its prosecution. At present,

however, they do not exist, and from the circumstances of none of the great kingdoms of India having ever adopted the Jaina as a State religion, its traces are only discovered in the more remote corners of the country, where they have hitherto generally escaped the notice of travellers. The principal Hindoo style arose in the south among the aboriginal Tamul races, and extends north as far as Ellora. We do not know at what age it first was practised, no example having yet been traced to so early a date even as the fourth or fifth centuries after Christ. When it first appears it seems to have adopted Buddhist forms, or at all events to have arisen out of the same forms from which the Buddhists elaborated their style. Hindoo architecture continues almost unchanged to the present day, except that the Mohammedan influence is sometimes strong in civil buildings, and cases occur in which a strange mania for copying debased European art has crept even into the sanctums of their temples. This, however, is a rare occurrence, and generally speaking it is only in the inferiority of workmanship and design that we trace the influence of age in this class of art. In Cashmere there still exists another style, differing from all these, showing in the first place a people secluded from the rest, perhaps retaining its earliest forms unchanged, or at all events owning different influences and practising a different art from any of the people around. When properly investigated it may throw new and unexpected light on this hitherto obscure subject.

Imitation in Art.

Music is not intended to copy any sounds which we hear in the woods or fields. A Paganini may imitate squalling cats, or a Richardson may mimic the twittering of birds, but these are mere tricks, and it is purely by accident that such tricks have become connected with music. Music would still be music, unchanged and unchangeable, if there were no violins or flutes in existence or possibility; yet cats and canary birds could not be imitated on the French horn or trombone. Dr. Whewell tells us that "music imitates the voices of human emotion and passion by tones taken from a definite scale of sounds," but we should say that the passion and emotion are not imitated, but merely accompanied. The swelling of musical waves is a scientific fact, not a process invented or constructed to reproduce anything known before. It is only from a natural yearning for analogies that we compare it to the expression of human feeling, and it is by a sort of conventional understanding that we call soft music tender, loud and steadily rhythmical passages heroic, minor phrases melancholy and the like.

The History of Architecture.

No branch of architecture can be properly studied when we limit the consideration to the productions of one country or of one epoch. He alone appreciates the full privilege of his art who studies the class rather than the individual. Each country has its illustrations, but the whole world alone contains the full development and all ages its entire history. The history of architecture is not easily appreciable, unless we keep in mind certain grand periods and their dominant types, which, as leading features, distinguish each aspect presented by the monuments of the several epochs. He who expects to be a good architect by knowing the history of all the styles and the phases which it has assumed through each period, will find himself much mistaken when he begins to practise. He may be a good historian and judicious critic, but not necessarily a good artist.

Egyptian Metallurgy.

The steel, whose blue edge the accurate painters of the Egyptian tombs have preserved, is more than three thousand years old. How did they temper copper with tin? How mould and use the metals? How work the mines of Nubia and Sinai and the Red Sea, which extend far under the water? We wander amid these mines to-day and behold the remains of the poor workmen, where the shafts have broken or the excavations fallen, with a new idea of the greatness of that power which offered hecatombs of lives in the building of altars. Or how is it possible that granite and sandstone were alike engraved and polished with a skill far surpassing the workmanship of the finest chisels in France? The obelisk which stands in solitary state in the Place de la Concorde at Paris turned the edge of the best steel, and the date of its erection could scarcely be put upon its pedestal, yet it was crowded with hieroglyphics. Upon many of the monuments of Egypt the letters are 3 inches deep, and the closest observation discloses only the perfectness of the work. The most delicate lines covering hundreds of square feet of the finest polished stone set at defiance all modern art. We learn that they gave bronze blades the elasticity of steel, and, without hardening it, made copper cut stone. Basalt was a plaything to them, and porphyry yielded, like marble, to the delicate yet strong touch of these masters. Vasari, the architect of Cosmo de' Medici, tells us that the duke found the secret of cutting granite in the Egyptian

style. This may be true, but the art is now lost. And whether the sand of Ethiopia or Pelusium polished the surface, whether the chemists hardened the chisels or softened the stone for the engraver, there they stand as triumphs of an art which waited centuries for a name.

Augsburg.

The streets of quaint old Augsburg are the most singular commentary on the modern architecture of Munich. The utter stillness and repose of the mass of buildings, each one of which harmonises with the rest in the commanding look, the absence of all striving after effect, the decided character of every façade, the citizen simplicity of ornament, contrast very strangely with the search for novelty, the mongrel mixture of styles, and the profuse decoration that characterise the capital. In Augsburg every restoration is effected with a view to improving what already exists, instead of grafting something new upon the old stock. Slight changes have been made; a few new houses have been built, several have been restored, and yet there is only one attempt to introduce the new Munich architecture. You may still roam about the winding streets, and gaze on old patrician houses, with their mounting roofs and the series of steps at the angles; you may lose yourself in narrow lanes, and extricate yourself at last by a dive through mysterious passages, propped open by beams; you may admire unaccountable little doors, made of a single plank, and locked with bars and padlocks, though scarcely large enough to admit anything bigger than a rat; you may look up with the most genuine admiration at the noble pile of the towering Rathhaus, and still find nothing to displease you in the old free town of the commercial Middle Ages. Perhaps there is no very real interest in thinking of Charles V. and the Emperor Maximilian when you have none of their works before you; and the admirable cellar of the Drei Mohren is far more worthy of a visit than the room in which Fugger burned the bond that Charles V. had left as a security. But there are people of such eminently historic minds that the least association is of value to them, so long as it can be duly authenticated.

Improvements in Fireplaces.

Among the first who directed attention to the improvement of the domestic hearth, Count Rumford is the best known in this country. The alteration which he made was very simple, but its success had the effect of remodelling all the arrangements of the fireplace, and it has been the parent of the numerous register stoves now seen, which have swept away the goodly chimney corners and wide, open fireplaces of our ancestors. This change was effected by contracting the throat of the flue. Within the large cavity of the chimney opening he formed, as it were, a second fireplace by building a wall in front of the chimney-back, and so much in advance of it that when carried up to the level of the arch at the back of the mantel a space of not more than 4 inches was left for the depth of the throat, from the back of the arch to the face of the new wall. He then contracted the opening over the fire by placing upright covings of brick in each interior angle of the recess. These formed an angle of about 135 degs. with the back of the fire, the distance between the re-entering angles of the covings being in no case greater than the width of the perpendicular part of the flue. By this arrangement the area of the throat of the chimney was reduced to 72 inches, and in many cases made even a third less. To facilitate the sweeping of the flue, the upper part of the back wall was formed with a slab of stone or fire tiles, which could be pushed back to allow a boy to pass into the flue, and replaced. The immediate results of these alterations were the entire prevention of smoky chimneys, increased heat thrown into the apartment, and a degree of general comfort previously unattainable.

Banks the Sculptor and Gothic Art.

It is not known generally that William Mulready was in his early years attracted by architectural subjects. In 1804 he exhibited views of the crypt of Kirkstall Abbey and of the west front of the same building. In 1807 he sent a view of St. Albans to the Academy. He always declared that the first drawings he made on entering Banks's studio were from Gothic sculptures, originals which had been given to Banks by Alderman Boydell, and taken from the porch at Guildhall in 1789, when the place was restored by George Dance. The statues represented Religion, Fortitude, Justice, Temperance, Law and Learning, at least they were so designated in the early part of this century. Mulready felicitated himself and his master on their being among the first persons to appreciate at its value the extraordinary merit of these specimens of Gothic art. So rigid was Banks in demanding due consideration for their beauty that he insisted upon the most unflinching rendering of all their characteristics. At Banks's sale, which took place shortly after his death in 1805, these works were sold for 100*l*.

NOTES AND COMMENTS.

THE Tarsney Bill, which was intended to enable unofficial architects in the United States to design Government buildings, having failed to realise the intention of Congress, a new Bill has been introduced which was prepared by the architects who are desirous to see the existing system changed. It proposes the establishment of a commission consisting of three prominent architects and two officers of engineers. The commissioners are to discharge all the administrative duties relating to the procuring of designs and the appointing of architects for all buildings to be erected by the Government of the United States. The Secretary of the Treasury is to be president, and the supervising architect is to be a member. The members are to be paid their actual expenses and subsistence, with an allowance of ten dollars a day while employed. If a building is to cost 100,000 dols. or more, five architects are to be selected by ballot to take part in the competition; if the building is to cost less, an architect can be selected by ballot without competition. No architect shall be eligible for entering as a competitor or for appointment who has not had at least ten years' experience as an architect in chief, and unless he can satisfy the commission, through work already done by him or otherwise, that he is competent to take charge of the economical construction of the building. Unsuccessful competitors are to be paid in the case of buildings to cost not more than 150,000 dols. the sum of 150 dols., and for every 100,000 dols. above that amount the additional sum of 100 dols., but in no case shall more than 1,000 dols. be paid to any unsuccessful competitor. The successful architect is to be appointed by the Secretary of the Treasury on the recommendation of the commission. He is to fill a complete set of the working drawings in the Treasury Department, from which duplicates are to be made and paid for out of the appropriation for the building. The architect's fees are to be 5 per cent., with the usual travelling expenses. A competent clerk of works is to be employed and paid for out of the appropriation. The supervising architect is to represent the Government, to receive the tenders, and, with the approval of the architect, to award the contracts. He is to perform all other duties pertaining to his office except those vested by the Act in the architect of the building. The clauses seem to be advantageous for architects. As it is generally supposed that in America there is encouragement for the young, the restriction of competitions to architects who have had at least ten years' experience will be a surprise. Some of the best modern buildings in England would not exist if a similar condition prevailed.

THE monument which is to be erected as a memorial of the late M. ALPHAND, the director of the municipal works of Paris, is in progress in the atelier of M. DALOU, the sculptor. It is to be erected in the garden in which stands the noble tower of St. Jacques, in the Rue de Rivoli, which is not only one of the best positions in the city, but is not far from the Hôtel de Ville, where M. ALPHAND so long laboured. The sculptor has arranged the memorial as a hemicycle with a statue in the centre. M. ALPHAND will be represented in everyday dress, holding his hat and umbrella in his left hand. With his right he points to a group of portrait-figures, who will represent Painting, Sculpture, Architecture and Engineering. There will be also figures of workmen. On the hemicycle will be reliefs which will suggest the appearance of Paris before and after the operations which M. ALPHAND planned. The architectural part of the memorial will be designed by M. FORMIGÉ. A monument of the engineer, on which the same artists have co-operated, has been set up in the cemetery of Père-Lachaise.

THE annual report of the Somersetshire Archæological Society states that the Society is progressing satisfactorily, though the number of members is almost stationary, being 550 this year against 558 last year. The balance in hand at the end of 1893 was 49*l.* 1*s.* 2*d.* on the general account, against 89*l.* 17*s.* 6*d.* in 1892, and 103*l.* 4*s.* 4*d.* in 1891. The decrease of funds thus shown is accounted for by the

increased bulk of the volume of "Proceedings," by ever-increasing demands in connection with the museum, and in the last year by a special grant of 10*l.* to the Somerset Record Society towards the printing of the "Register of Bishop Ralph of Shrewsbury." On the Castle Purchase Fund, there is a small debt of 6*l.* 2*s.* 5*d.* against 5*l.* 5*s.* 4*d.* last year. The subject of the restoration of the castle buildings was referred to in last year's report. The Council hopes that this important matter will still be borne in mind and that a fund for this purpose will soon be set on foot. The number of visitors to the museum and library during the year 1893 was 5,539 against 5,328 in 1892. Since the last annual meeting the Society have had to share with the county at large in lamenting the removal from amongst them of one of their most valued and accomplished vice-presidents, Lord ARTHUR HERVEY, the bishop of the diocese. The index to "Collinson" is proceeding, and a hope is expressed that it may be published before the meeting of 1895. The county history still awaits the coming editor, and Mr. GREEN'S "Bibliography" needs more subscribers. During the past year have been published Mr. C. W. BARRETT'S "Somersetshire Highways, Byways and Waterways," Mr. E. J. RAWLE'S "Annals of Exmoor Forest," Mr. JOHN BATTEN'S "Historical and Topographical Collections Relating to South Somerset," and Canon CHURCH'S valuable "Chapters in the Early History of the Church of Wells." The latter had come at a most opportune moment, when renewed interest was being stimulated by the recent discoveries in the eastern cloister, and by the fact that the excavated ground had no sooner been replaced than it had to be reopened for the interment of the late Bishop. The Council with great pleasure announce that Lieutenant-Colonel EWING has kindly undertaken the duties of honorary superintendent of the museum and library, and that arrangements have been made for the more rapid compilation of a catalogue of the Society's very valuable collections. Recognising the long and faithful services of the curator, Mr. BIDGOOD, an addition of 20*l.* per annum has been made to his salary. The Right Hon. Lord PORTMAN, to whom the Society is indebted for a large and most important collection of geological specimens, has expressed his readiness to accept the position of vice-president.

It is proposed to erect a memorial of GUSTAVE NADAUD, the song-writer, in Roubaix, and a competition was accordingly arranged. The jury of selection contained a remarkable number of members. Besides the elected of the committee of subscribers, there were MM. PAUL LEFORT and ROGER BALLU, inspectors of fine arts representing the Minister, M. DAILLON the sculptor, M. BILLORÉ, president of the architects of the north of France, M. BILYGVN, Government architect at Lille, M. MAILLARD, architect, and M. HENRI VERLAIS, administrator of the School of Industrial Art at Roubaix. Their choice was the model by M. CHARLES LEFEBVRE, architect, and M. CORDONNIER, sculptor. It ought to be deserving of the distinction after satisfying so many judges. Yet probably all the competitors were not satisfied with the result.

THE old question about making a bill of quantities form a part of the contract arose in the House of Commons on Wednesday *à propos* of the new Liverpool Post Office. It has been announced that the Government will not be responsible for the accuracy of the quantities, and Mr. LAWRENCE was eager to know whether that course, especially in works of considerable magnitude, was not unusual. The First Commissioner of Works in reply said that the advertisement inviting tenders for the new post office at Liverpool notified, as was usual in the case of all new works under the Department, that the Commissioners of Works did not hold themselves responsible for the building quantities. The suggestion in the question was a very serious one. It was now receiving consideration by the technical officers of the Board, and it would be decided as soon as possible. It may be assumed that the decision will be to the effect that the practice of the officers has always been right, and does not differ much from the practice adopted in ordinary contracts.

DECORATIVE PANELS.

THE four panels in painting and wood-carving represent the four seasons. They are the lower panels of two doors in a large Sala designed and painted by Professor CASARE FORMILLI belonging to one of the best known connoisseurs and patrons of art in Portugal, Signor MANOEL DE CASTRO GUIMAREAS. These figures are on a neutral ground, and correspond in subject with four landscapes, which form the upper panels of the doors. The Spring is draped in green on a background of almond flowers; the Summer in white surrounded by roses; the Autumn in terra-cotta, with grapes in the background; the Winter is draped in yellow bronze on a background of ivy. In later numbers of this Journal will be published some other of the many pictures and sculptures in this Sala, on which large work the artist spent some five years.

The chief characteristics of this work, in addition to a large frieze of life-size figures and large ceiling picture, are the walls of mirrors, painted with flowers and foliage, which make a reciprocal and infinite reflection of one another, and so produce one of the most striking effects imaginable, especially at night when lighted with four large chandeliers which stand out from the pedestals of four statues in the angles of the room. The whole effect is of an illimitable garden in fairyland.

RESIDENCE, WESTFIELD ROAD, EDEBASTON.

THIS residence has recently been erected by Mr. G. H. MARSHALL, builder, of Smethwick, from the designs and under the superintendence of Messrs. ESSEX, NICOL & GOODMAN, architects, of Birmingham, for Mr. P. A. MARTIN. The exterior is faced with picked common red bricks and Bracknell rubber brick dressings, and the roofs are covered with brindled tiles.

LONDON AND PROVINCIAL BANK, NEATH.

THE façade is designed in the Renaissance style, and will be built of Box ground stone entirely. On the ground-floor are the bank chamber, with manager's rooms, clerks' lunch-room, strong-room, muniment-room, lavatories and water-closets. There are also the manager's dining-room, kitchen and offices on this floor.

The first and second floors are planned for the residence of the manager.

The contract has been let to Mr. ABRAM GEORGE, of Neath, and the plans have been prepared by Messrs. WILSON & MOXHAM, architects, of Swansea.

NEW SCHOOL, BATHGATE.

[The wrought-iron staircase balustrade at Wheatfield Court, Headingley, near Leeds, illustrations of which appeared in *The Architect* last week, was executed by Messrs. Jones & Willis, of London and Birmingham.]

SHEFFIELD SOCIETY OF ARCHITECTS.

AT the meeting of the Sheffield School Board, the *Sheffield Independent* says the business was chiefly of a routine character, and the proceedings did not last an hour. In the absence of the chairman Mr. B. Fletcher (vice-chairman) presided, and the other members present were Mrs. Hoskin, the Revs. G. W. Clapham, T. W. Holmes and H. J. Shaw, Messrs. F. P. Rawson, J. Knowles, W. Colver and R. Jackson.

In the minutes of the building committee there appeared the following:—"The committee have considered a letter, signed by Mr. E. M. Gibbs and Mr. C. Hadfield on behalf of the Council of the Sheffield Society of Architects and Surveyors, with reference to the competitive plans for the Tinsley Park Road School, pointing out that in view of the assessor's report and the fact that only three infants' classrooms are shown on the plans marked 'Sangler Rouge,' those plans should have been set aside and the first place awarded to 'Multum in Parvo.' The committee have also considered a protest signed by nine competitors who sent in plans for the proposed school at Tinsley Park Road, but they do not recommend any action thereon."

Mr. Rawson said that the whole point of the matter was that the plans which were selected did not conform to the conditions, as they only provided for three classrooms instead of four, and the other plans did conform. It seemed to him that there was justification for the protest of the architects, and good ground for the Board asking for an explanation.

Mr. Fletcher, as chairman of the building committee, regretted that the architects had felt it necessary to make this protest, because there had not been the smallest desire on the part of any one connected with the Board to do the least unfair thing towards them. Some of the architects to whom he had spoken seemed to be under the impression that the committee had allowed the assessor to select the designs, but that was not so; he had simply given the committee his advice, and they had treated it as the advice of a skilled man. He with confidence asked the Board to confirm the minutes.

The Rev. T. W. Holmes said he did not think anybody would imagine that there was an intention to do injustice to the architects who were competitors, but he thought it must be admitted that they had good ground for complaint when the Board's conditions were that there were to be four classrooms, and when plans had been selected which did not conform to the conditions.

The Rev. H. J. Shaw regretted that this matter should have arisen, but it seemed to him the most natural thing in the world that some misunderstanding should have occurred, seeing that in the conditions some paragraphs said there "must" be certain things, and others said there "should" be. He could conceive that the successful architects might have understood that they had a certain amount of discretion; the fault was in the fact that the conditions were not more explicitly worded. It seemed to him that it would be well in future if they divided their conditions into two sections—those which were imperative and those which were suggestive.

The Rev. G. W. Clapham agreed with Mr. Holmes and Mr. Shaw that their conditions should be more specific; but he intended to vote for the adoption of the minutes.

Mr. Rawson did not think the answer suggested by the committee was sufficiently satisfactory. He felt that one or two of the architects had been placed at a very great disadvantage. It was true that the vagueness of the conditions had led to the difficulty, and the committee had gone away from those architects who had strictly and conscientiously observed the conditions, and given the palm to one who had taken liberties with them. It was an easy way to get out of a difficulty to say that in future the Board must be careful what they were doing, but what about the architects who were now affected?

The Rev. H. J. Shaw thought they could not go back upon their decision without inflicting an injustice on the architect whose plans had been accepted.

Mr. Fletcher said that as chairman of the building committee, and from the position he occupied at that Board meeting, he did not hesitate to express his regret that such a misunderstanding should have happened.

The minutes were then passed.

The following is the correspondence which took place:—

[COPY.]

To the Chairman and Members of the Sheffield School Board.

Gentlemen,—The Council of the Sheffield Society of Architects and Surveyors have had their attention drawn by several competitors to the assessor's report on the designs submitted for the school at Tinsley Park Road, and to the award of the first place to the design "Sangler Rouge."

The service rendered to the School Board by the architects of Sheffield in submitting fourteen sets of designs for the school, at a cost to the profession of considerably more than the commission to be paid for the completed building is, it is hoped, a sufficient reason for the Council of the Sheffield Society of Architects and Surveyors venturing to submit their views to the Sheffield School Board.

The award appears to be based upon one of the concluding paragraphs of the assessor's report rather than upon the preceding fuller criticism.

The assessor brackets together as equal "Sangler Rouge" and "Multum in Parvo," the former for his higher qualities of architectural design, the latter for his more perfect fitness of plan, and states that "on a third ground, viz. that of suitability to site," he prefers the former, although from the detail report the latter appears to be the one he prefers.

The assessor's fuller criticism of design "Sangler Rouge" states that it provides only three infant classrooms (which is contrary to the conditions of the competition), and, after enumerating points in which the plan does not comply with the requirements of the Education Department, states, "but although ranking artistically higher than any other, the defect of plan is serious."

The assessor's fuller criticism of design "Multum in Parvo" states that "the position of the building on the land is well managed, and in fact all the playgrounds will be sunny"; that he "is the only one who has met all the difficulties without any waste or surplusage in plan," and further that "he is also at top in point of economy."

The conditions of the competition state that the buildings are to fulfil the requirements of the Education Department.

The rules to be observed in planning schools, as issued by

that Department, enumerate "convenience of plan, suitable lighting and proper subdivision into classes," as leading essentials, and "the school architect is recommended first to perfect his plan."

The Council of the Sheffield Society of Architects and Surveyors are therefore of opinion that the first place should have been awarded to "Multum in Parvo," and further that the design "Sanglier Rouge" should have been set aside as not having complied with the conditions as to the number of classrooms for infants.—We are, gentlemen, yours respectfully,

(Signed) EDWD. M. GIBBS, President
CHARLES HADFIELD, Vice-president.

Sheffield: July 28, 1894.

School Board Offices, Sheffield: Aug. 17, 1894.

Tinsley Park Road School.

Dear Sir,—I am directed to acknowledge the receipt of a letter signed by yourself and Mr. Hadfield on behalf of the Council of the Sheffield Society of Architects and Surveyors, and dated July 28, 1894. The Board regret to find that objection has been taken to their decision upon the recent competition, but I am to point out that your Council has evidently laboured under the mistake of supposing that an assessor was appointed, whereas the Board simply asked for advice, and reserved to themselves the full power of determining which, if any, plan should be adopted. They made their selection in perfectly good faith after very careful consideration, and they cannot alter their decision.—Yours faithfully,

(Signed) JOHN F. MOSS, Clerk.

E. M. Gibbs, Esq., 15 St. James's Row, Sheffield.

Mr. John F. Moss, Clerk to the Sheffield School Board.

15 St. James's Row, Sheffield: August 21, 1894.

Tinsley Park Board School Competition.

Dear Sir,—I have to acknowledge the receipt of your letter of August 17, 1894. The Council of the Sheffield Society of Architects and Surveyors request you to assure your Board that they never doubted but that the selection of the designs was made in perfectly good faith.

The Council have, however, to notice that your letter of August 17 does not reply to the main points of contention of the letter of July 28, and as your letter has been published, the Council have thought it desirable to send copies of the whole correspondence to the professional papers.—Yours truly,

(Signed) EDWD. M. GIBBS,

President of the Sheffield Society of Architects and Surveyors.

QUANTITY SURVEYING.*

LITTLE is known of the exact date at which quantities made their prominent appearance. I say prominent, for it is obvious that from the time when contracting was first introduced in building operations, before an opinion could have been formed as to the price to be agreed upon in any contract, some calculation must of necessity be made, and we are about to consider how that prominence originated; also as to the custom existing now, how such calculations are best done, and whose work it is to do them. The necessity for quantities being supplied to contractors tendering is fairly argued in the fact of their universal adoption. Their utility in England is recognised from H.M. Board of Works downwards, and the surveyors who supply them have for their benefit and protection an established Institute of which most surveyors of standing are members. There is an examination to pass before a member is admitted; in addition to which candidates have to be proposed and seconded by six Fellows, the applications being afterwards considered by the council and then voted on by a general meeting; consequently membership is recognised as a guarantee of respectability in many ways. Another great argument in their favour which materially affects those most concerned, but particularly the architect, is the fact that a set of drawings passing through the hands of a competent surveyor have that scrutiny which it is impossible for them to get otherwise; any weak places are almost sure to be detected, and as this occurs before a contract is entered into with the builder, it gives an opportunity to amend, revise, &c., if required, avoiding complications and much unpleasantness with the architect, as he naturally fears he will be considered to have exercised but a very limited amount of care in the execution of his work; with the client, who considers he is called upon to pay unreasonably; and with the contractor, for doing the work he must—such discrepancies being generally connected with structural matters—but often lands him in a position to either make no charge whatever or choose between that and litigation. Just one other reason whilst we are considering this part of the subject—without intending any reflection on that body for one moment—it can safely be urged that no contractor, whatever his ability,

whatever his perspicacity, whatever his judgment, could arrive quickly at a price, in all cases accurate enough for him to undertake to carry out the works without loss to himself; no man is equal to that task, and yet this would have to be done to keep pace with the enormous number of works he must necessarily tender for unsuccessfully. Even his best work must naturally be rough and approximate; he has other duties than simply tendering for work; consequently, he can only devote a very few hours to each work for which he tenders—unsatisfactory to him, I say, for he is working all through the job in the dark; unsatisfactory to the client, as he may be paying for much more than he gets; unsatisfactory to the architect, as his gratuitous care, trouble and anxiety in the case of a contractor who is beginning to discover he is getting too little for his job is beyond conception, for it may lead to any extreme. It is quite true the builder may if he chooses employ and pay someone to do this work for him, but is it not better for him to be free from any expense and responsibility whatever, for surely the proper person to pay for such work is the employer, and as has been seen by doing so places himself in a much more satisfactory and definite position? The old system has the merit of excitement to those who feed upon that element, and it sometimes turns up comfortably; for the contractor unfortunately sometimes not, so he can never make much certainty of what he is about in this matter. With accurate and guaranteed figures to guide him, supplied free of charge, he may even order his stuff, bricks, &c., from such figures. The writer knows several who actually do this. It has often been observed that the quantity surveyor's commission is that amount more than the client would otherwise pay. If we take into consideration the proportion that amount bears to the full cost of the works, we shall see at once that even should this be the case it is cheap at the price, for reasons just before referred to, and any reasonable person will acknowledge it to be so.

The usual commission in London is $1\frac{1}{2}$ or $1\frac{1}{4}$ per cent. for all works of any considerable size. The percentage is much larger in various country districts, and even in large towns, Manchester, Birmingham and Leeds, for instance, but then the works average smaller in size, and the architect not infrequently supplies the quantities himself, a practice considered by many a most reprehensible one; but this is often done probably for the same reason that one sees in this country, "architect, watchmaker, tobacconist and hairdresser," an insufficiency of the one line to support a living. Be this as it may, the case of an architect supplying his own quantities has been fully discussed at the meetings of the Royal Institute of British Architects and elsewhere, with the generally understood result that no architect of any pretensions as an architect should adopt this proceeding.

We have seen that figures of quantity upon which to arrive at an approximate cost of a given work had to be prepared. These were, probably, in the dark days accomplished by the contractor himself, but as time wore on and architectural design became more complex and elaborate, considerable speculation could have been exercised as to the probable cost of work at this period, based upon the old system. This, therefore, gave birth to a more searching and accurate method, and which introduced to the old countries that painstaking, hardworking man of figures, the quantity surveyor. Although many instances have occurred in and outside the Law Courts themselves as to the exact position this gentleman occupies, and many and varied are the opinions, legal and otherwise, expressed of late years, he has maintained a place unquestioned by those intimately connected with building operations, if not altogether by those outside that community. Certain it also is that his work involves the greatest care and knowledge of everything appertaining to building operations, and, to use the words contained in a paper recently read at a meeting of the London Institute of Builders:—

"He must virtually be a man of considerable grasp of mind, great quickness of perception, possess a tenacious memory, great order of thought and power of organisation and concentration, and be a man of decision. These natural gifts must be dominated by a rigid integrity. These qualifications are not of my own imagining, but those possessed by surveyors I know."

We now come to the question who should be the loser in case of any inaccuracy in the quantities? This is a very sore point with many. A few lines quoted from the President's address (R.I.B.A.) November 8, 1890, touching this question may be interesting here. He says:—

"The most rational professional and equitable way is for the surveyor to hold himself responsible for the accuracy of his quantities to both client and contractor."

If he exercises great skill and care an error of any magnitude is impossible, if a rough check is made after the "bill" reaches the draft stage. This is adopted by many known to the author and with gratifying results. Why then should a surveyor have any reluctance to guarantee his figures? Unless he be a very careless, inexperienced, slipshod person, he

* A paper read by Mr. M. C. Day before the Institute of Architects of New South Wales, and published in the *Australasian Builder*.

should be able to place sufficient confidence in his work to do this, and of the many callings in life, excepting, perhaps, medicine, this of all others has no room for such a person. Why should the unfortunate contractor be expected to name, and be bound by, a price the amount of which is based solely upon certain quantities of work which are supplied him? If he supplies his own, naturally he would suffer if he makes a mistake; but if the figures be supplied him by an experienced person, whose occupation is to make such calculations, how can it be considered reasonable that the contractor must suffer in this case? Is it not much better that he should be released from any such trouble and responsibility, the surveyor taking any risks in connection with his own work?

We will now glance at the legal aspect. The view taken by the English Court, even as recently as 1882, seems to be somewhat uncertain, for in the case *Evans v. Carle*, Lord Coleridge remarked:—"It is quite monstrous that the employer should pay for the quantities, that is, that he should pay for what it is the duty of the architect to do."

So that the learned judge evidently considered the preparing of quantities embodied in the duties of the architect, and that the employment of a surveyor was altogether improper, which shows, even in high circles, the great misconception of the question which then existed, arguing that it would be proper to apply in the matter of human repairs to a chemist because he sells physic. The architect usually issues the quantities, but the surveyor prepares them. Fortunately, later cases have considerably cleared the matter up beyond all question. Let us refer to *North v. Bissett* (Law Reports 1 Q.B. 1892, p. 333). In the course of his judgment Mr. Justice Mathew observed:—

"What is the usage which, upon these facts, it is sought to set up? It is one which I should have thought to be notorious—a usage that the fees of the quantity surveyor are paid by the builder whose tender has been accepted. This is a sensible and convenient usage. It brings all the people together, the builder, the client and the surveyor, and they all assent to it."

On the same occasion Mr. Justice Smith also says:—"This kind of tripartite agreement is a sensible and convenient one."

These gentlemen are spoken of as two of the ablest and most shrewd judges on the Bench, noted alike for their commercial knowledge and common sense. Upon this occasion reference was made to a decision given in a Court of Appeal in connection with the well-known case *Priestly v. Stone* in 1888, remarking—although Lord Justice Lindley said, "There was no privity of contract between the two parties" (action by builder against a quantity surveyor for damages caused by negligence in preparing an inaccurate bill of quantities):—"I am convinced that the Court of Appeal in *Priestly v. Stone* never meant to say that the usage was a bad one," said Mr. Justice Mathew, and Mr. Justice Smith remarked similarly. There is another peculiar case touching the question, and which should be referred to since it affects another feature of it. In this case the contractors, having become bankrupt, their trustees sued the client for balance of contract; included in this balance was an amount for surveyor's commission. The client had previously assumed his right to deal with the surveyor directly, which he did, and discharged his account without reference to the contractor, a course in which he was supported by the court, Mr. Justice Grantham, who heard the case, freely assenting. This case is hereby referred to to show that in these days the quantity surveyor has a recognised legal status in building transactions. It shows, and unmistakably, that privity is now taken to exist between the parties, and that this fact is fully understood. This is a great advance. In reference to court cases affecting quantity surveying, we have them as far back as 1837, the notorious *Moore v. the Guardians of the Witney Union* case having been heard in that year.

We now come to the question of the practical application of quantities. If the question be asked, should quantities be made a portion of the contract, many architects will at once exclaim "No." Others will say just as emphatically "Yes." We have seen that preparing bills of quantities by a professional person is the rule; also, that that person and his work are fully recognised in the English courts; the question as to the practical adoption naturally follows, although there will in all probability be many following an adverse course when another is fully received as the popular one by others, arising probably from differences of personal opinion, still we are all anxious to avoid any reputation for eccentricity, and work in the common groove. At the same time, we feel called upon to satisfy ourselves that we in our professional capacity are not playing the part of an automaton. It is the practice in some prominent offices in England to first prepare contract drawings; these are handed over to the firm's surveyor, a gentleman constantly employed by them in their own offices, at a fixed salary usually, who prepares (provided with a list of any special or unusual features which are intended to be embodied in the design) quantities of what he has before him. This work completed, the specification is next prepared, and the whole thing then ready for tendering. Tendering proceeds by con-

tractors forwarding a price based solely upon the quantities as to quantity and description. In some instances a tenderer may call at the architect's office and make an inspection of the drawings and specification; but this is far from customary, unless something very much out of the common is intended. His tender is opened in the presence of all other tenderers, each taking a list as the totals are read out. One is subsequently accepted and tenderers apprised of the decision by advertisement or private communication, and the contract is then entered into. Before a contract, however, is actually signed the contractor fills up a duplicate copy of the bill, which is handed to the architect at the time of signing, and which is intended to act as a schedule of prices for any addition, omission or deviation which may be deemed desirable, provided of course that in the event of the contractor not being informed of such addition, omission or deviation in sufficient time to prevent him sustaining any pecuniary loss, a similar allowance is as usual made. In this case the quantities are taken to be the amount of work, neither more nor less being expected to be done by the contractor who signs the contract, the contract being made accordingly, very much the same in principle to a grocer or other tradesman supplying goods of certain quantities and description referred to in a list provided by the purchaser, only on a much larger scale, a sum total being paid for the whole, any deduction or omission or deviation of course affecting the said total. Here we have perhaps the introduction of quantities in the simplest and most straightforward manner, and there can be absolutely no doubt whatever as to what is or what is not contained in the contract, a feature by no means an insignificant one. The architect's account in this case is of course the greater by the $1\frac{1}{4}$ per cent. addition for preparing and supplying quantities. It will be seen that the architect's proceeding in having a gentleman and staff in his direct employ exclusively for this work, is a question of his own business arrangements and individual opinion. It is certain he cannot claim such additional percentage without himself incurring much more extra cost and responsibility, for he must keep a reliable person to take off, who in his turn has several assistants, and in most instances a separate part of the offices. So that it practically amounts to his keeping a separate staff, doing more work, and consequently receiving more pay. One circumstance alone in many cases would affect the adoption of this course, the one already referred to. Is not the work distinctly apart from the recognised duties of the architect? Is not this the work and responsibility of altogether another profession? The feature in the arrangement of the architect supplying quantities prepared directly by him in this way by no means affects the principal merits of this method, it being apparent that an independent person could supply them equally well for the position they occupy here. It is referred to as it is actually the proceeding known to be adopted in offices where quantities are made the basis of the contract. Another method followed by other architects and a course much more practical than the former is that, drawings and specifications having been prepared, approved of and completed, they are handed over to a quantity surveyor, well known and respected by all concerned—excepting perhaps the client himself—who commences his part of the work, and finally, after, perhaps, a consultation or two with the architect, completes and issues the bills himself, or, after competition, hands them over with the drawings and specification to the architect. These quantities are guaranteed by the surveyor, and are taken to be a fair and equitable quantity and description of the work to be done, as shown by the drawings and specification, and there is rarely any trouble arising in connection with the whole transaction; but the quantities are not taken to be a portion of the contract, nor are they referred to in any way whatever in that document. This method works smoothly enough except in isolated cases in which, perhaps, no other conceivable arrangement could have made a complete success. The question seems a perfectly simple one, with an equally simple answer. Why seek to introduce any other arrangement when this works so smoothly? Why interfere at all with a principle which has become time-honoured and is found to work so well? The practice in Scotland is to estimate and tender from bills of quantities and measure up afterwards, the contractor being paid for the work actually carried out.

We have now sifted our subject roughly. It is quite true much more might be added, but we have, I venture to think, seen:—1. The origin of quantities, and the necessity for their introduction. 2. An analysis of the duties appertaining to quantity surveying, the surveyor himself taking out his quantities, as it were. 3. The legal bearing with reference to a few cases of modern date relating closely to our subject, quoting expressions of opinions from some of the most distinguished judges on the English Bench, and having concluded with a description of how this branch of the profession is practically employed in architectural practice in England, giving the two methods most general there. This we may term is dealing with the theory of the subject.

THE TRUE PRINCIPLES OF POINTED OR CHRISTIAN ARCHITECTURE.

By A. WELBY PUGIN.

(Continued from page 108.)

IN the third and last place, we will consider architectural propriety with reference to domestic and civil architecture. Most of the mansions erected at the present day in the Italian or Pointed architecture are either burlesques or false application of both these styles. In the first place, what does an Italian house do in England? Is there any similarity between our climate and that of Italy? Not the least. Now I will maintain and prove that climate has always had a large share in the formation of domestic architecture, and the Italian is a good illustration of the truth of this remark. The apertures are small; long colonnades for shade, and the whole building calculated for retreat and protection from heat; the roofs are flat in pitch, from the absence of heavy snow; and plan and outline are both suited to the climate to which the architecture belongs. But we demand in England the very reverse of all this for comfort. We cannot fortunately import the climate of a country with its architecture, or else we should have the strangest possible combination of temperature and weather, and within the narrow compass of the Regent's Park the burning heat of Hindustan, the freezing temperature of a Swiss mountain, the intolerable warmth of an Italian summer, with occasional spots of our native temperature. I wonder if these ideas ever occur to those who design Italian gardens on the moorlands of England. Truly it will not be a matter of surprise if some searcher after novelty try to cultivate a jungle for imitation tiger-hunting on some old English estate.

Another objection to Italian architecture is this: we are not Italians, we are Englishmen. God in his wisdom has im-

England is rapidly losing its venerable garb; all places are becoming alike; every good old gabled inn is turned into an ugly hotel with a stuccoed portico, and a vulgar coffee-room lined with staring paper, with imitation scagliola columns, composition glass frames, an obsequious cheat of a waiter, and twenty per cent. added to the bill on the score of the modern and elegant arrangements. Our good old St. Martin's, St. John's, St. Peter's and St. Mary's Streets are becoming Bellevue Places, Adelaide Rows, Apollo Terraces, Regent Squares and Royal Circuses. Factory chimneys disfigure our most beautiful vales; Government preaching-houses, called churches, start up, at the cost of a few hundreds each, by the side of Zion chapels, Bethel meetings, New Connexions, and Socialist halls. Timbered fronts of curious and ingenious design are swept away before the resistless torrent of Roman-cement men, who buy their ornaments by the yard and their capitals by the ton. Every linen-draper's shop apes to be something after the palace of the Cæsars; the mock stone columns are fixed over a front of plate glass to exhibit the astonishing bargains, while low-ticketed goods are hung out over the trophies of war (see woodcut). But this is not all; every paltry town has a cigar divan, with something stuck out to look Turkish, and not unfrequently a back parlour travestied into a vile burlesque of Eastern architecture. In short, national feelings and national architecture are at so low an ebb, that it becomes an absolute duty in every Englishman to attempt their revival. Our ancient architecture can alone furnish us with the means of doing this successfully; but unfortunately those

A Cæsar's Drapery Shop.

A Castellated Mansion.

planted a love of nation and country in every man, and we should always cultivate the feeling; we ought to view the habits and manners of other nations without prejudice, derive improvement from all we observe admirable, but we should never forget our own land. Such is, indeed, the extraordinary amalgamation of architecture, style and manners now in progress, that were it not for the works of nature which cannot be destroyed, and the glorious works of Christian antiquity which have not yet been destroyed, Europe would soon present such sameness as to cease to be interesting. Already a sort of bastard Greek, a nondescript modern style, has ravaged many of the most interesting cities of Europe, replacing the original national buildings with unmeaning lines of plaster fronts, without form, without colour, without interest. How many glorious churches have been destroyed within the last few years (*pour faire une place*) for the occasional exercise of the national guard!—where a few stunted trees and a puddle of water in a stone basin, which spouts up occasionally some few feet in height, is all we have to see in exchange for some of the most interesting memorials of ancient piety

who profess to admire Pointed architecture, and who strive to imitate it, produce more ridiculous results than those who fly to foreign aid. What can be more absurd than houses built in what is termed the castellated style? Castellated architecture originated in the wants consequent on a certain state of society; of course the necessity of great strength, and the means of defence suited to the military tactics of the day, dictated to the builders of ancient castles the most appropriate style for their construction. Viewed as historical monuments they are of surprising interest, but as models for our imitation they are worse than useless. What absurdities, what anomalies, what utter contradictions do not the builders of modern castles perpetrate! How many portcullises which will not lower down, and drawbridges which will not draw up! how many loopholes in turrets so small that the most diminutive sweep could not ascend them! On one side of the house machicolated parapets, embrasures, bastions and all the show of strong defence, and round the corner of the building a conservatory leading to the principal rooms, through which a whole company of horsemen might penetrate at one smash into the very heart

of the mansion—for who would hammer against nailed portals when he could kick his way through the greenhouse? In buildings of this sort, so far from the turrets being erected for any particular purpose, it is difficult to assign any destination to them after they are erected, and those which are not made into chimneys seldom get other occupants than the rooks. But the exterior is not the least inconsistent portion of the edifice, for we find guard-rooms without either weapons or guards; sally-ports, out of which nobody passes but the servants, and where a military man never did go out; donjon keeps, which are nothing but drawing-rooms, boudoirs and elegant apartments; watch-towers, where the housemaids sleep, and a bastion in which the butler cleans his plate—all is a mere mask, and the whole building an ill-conceived lie (see woodcut).

We will now turn to those mansions erected in what is termed the abbey style, which are not more consistent than the buildings I have just described. To this class Fonthill belonged, now a heap of ruins, and modern ruins too, of mere brick and plaster. In such a house something of an ecclesiastical exterior had been obtained at an enormous expense, and a casual passer-by might have supposed from some distance that the place really belonged to some religious community; but on a nearer approach the illusion is soon dissipated, and the building, which had been raised somewhat in the guise of the solemn architecture of religion and antiquity, discovers itself to be a mere toy, built to suit the caprice of a wealthy

building, and presenting a standing illustration of good old English hospitality; while the venerable parish church in the immediate vicinity, with its grey spire and family chantry, showed that the care spiritual was not neglected by our ancestors in the erection of their temporal dwellings (see woodcut).

Every person should be lodged as becomes his station and dignity, for in this there is nothing contrary to, but in accordance with, the Catholic principle; but the mansions erected by our ancestors were not the passing whim of a moment, or mere show-places raised at such an extravagant cost as impoverished some generations of heirs to the estates, but solid, dignified and Christian structures, built with due regard to the general prosperity of the family; and the almost constant residence of the ancient gentry on their estates rendered it indispensable for them to have mansions where they might exercise the rites of hospitality to their fullest extent. They did not confine their guests, as at present, to a few fashionables who condescend to pass away a few days occasionally in a country house; but under the oaken rafters of their capacious halls the lords of the manor used to assemble all their friends and tenants at those successive periods when the Church bids all her children rejoice, while humbler guests partook of their share of bounty dealt to them by the hand of the almoner beneath the groined entrance of the gate-house. Catholic England was merry England, at least for the humbler classes; and the architecture was in keeping with the faith and manners of the times, at once strong and hospitable. There is a great reviving taste

Old English Mansion, &c.

individual, and devoted to luxury. The seemingly abbey-gate turns out a modern hall, with liveried footmen in lieu of a conventual porter; the apparent church nave is only a vestibule; the tower, a lantern staircase; the transepts are drawing-rooms; the cloisters, a furnished passage; the oratory, a lady's boudoir; the chapter-house, a dining-room; the kitchens alone are real, everything else is a deception. Articles of fashionable luxury, glasses in profusion, couches and ottomans, fill the chambers of the mock convent, from whence a prayer never ascends, or into which a religious man never enters; all, in fine, is a mockery and thing of fashion, transient and perishable as the life of its possessor, and if the structure be substantial enough to last his time, it soon after becomes the subject of some auctioneer's puff; its walls are covered with placards, brokers divide the movables, the whole falls to decay, and is soon only mentioned as a splendid folly.

The old English Catholic mansions were the very reverse of those I have been describing; they were substantial, appropriate edifices, suited by their scale and arrangement for the purposes of habitation. Each part of these buildings indicated its particular destination—the turreted gate-house and porter's lodging, the entrance porch, the high-crested roof and louvred hall, with its capacious chimney, the guest chambers, the vast kitchens and offices, all formed distinct and beautiful features, not masked or concealed under one monotonous front, but by their variety in form and outline increasing the effect of the

for ancient domestic architecture, but a vast many pretended admirers of old English beauties, instead of imitating the Tudor period, when domestic architecture was carried to a high state of perfection, stop short at the reign of Elizabeth, the very worst kind of English architecture; and, strange to say, these unmeaning conglomerations of debased forms have been classed into a regular style, and called after the female tyrant during whose reign they were executed. The only reason I can assign for the fashionable rage for this architecture (if so it may be called) is that its character is so corrupt, mixed and bad that the anachronisms and anomalies so frequently perpetrated by modern architects are made to pass muster under the general term of Elizabethan; and certainly I cannot deny that the appellation is very appropriate when applied to corrupted design and decayed taste.

(To be concluded.)

It is stated in the prospectus of the Glasgow School of Art for the coming session that the ordinary advanced work in life and painting has been revised and made as complete as possible. The work of the technical studios has been improved, and new appointments of skilled instructors made. The architectural section has as a leading feature a series of lectures on Mediæval architecture, to be delivered by Mr. Alex. M'Gibbon, A.R.I.B.A.

MONT ST. MICHEL.

FROM the elm-shaded terraces of Avranches, says a correspondent of the *Glasgow Herald*, the eye wanders with delight over one of the most beautiful landscapes that northern France affords. For miles around the valley watered by the Sée and the Sélune spreads out in an ocean of ever-varying verdure—now light, now dark, as the sunshine falls on an expanse of fertile plain, or on the luxurious foliage of the trees scattered about in thick clumps. Away in the background the yellowish sands mark out the sinuous boundary of a gulf which extends, crescent-shaped, from Granville in the north to Pontorson in the south. This is the “blue, savage Norman bay.” In the midst of it there rises on its steep-peaked rock, like an enchanted castle, that splendid and imposing structure to which the admiration of the Middle Ages gave the name of the Wonder of the West, the historic pile of Mont St. Michel. Thus seen at a distance, veiled by the mist and surrounded by sand and sea, it seems to be rather a colossal menhir than the work of human hands.

According to the tradition of the district, the Couësnon, which here serves as a limit between Normandy and Brittany, once flowed to the east of the Mount, whereas at present its sandy bed is a few yards to the west. Hence the popular Breton rhyme:—

Le Couësnon, dans sa folie
A mis le Mont en Normandie.

To this the Normans, strong in possession, arrogantly reply:—

Si bonne n'était Normandie
Saint Michel ne s'y serait mis.

But in spite of St. Michael and the Couësnon, the Mount stands in a landscape, of which the weird grandeur is characteristic of the former rather than the present possessor.

In Celtic times, however, St. Michael's Bay was very different from what we see it now. A dense forest covered the greater part of the immense waste of sand which forms a kind of debatable territory between land and sea, and over which at each flood the waves rush in to assert their sway. At its extremity there stood a huge pyramid of granite, of which the Druids had taken possession, and which they had consecrated to the worship of the sun-god. From him it took the name of Tom Belen, changed at a later period into Mons Tumba or Tumulus Beleni by the Roman invaders. A cavern within the rock was used as a Neimheidh or ancestral sanctuary, and it was from its gloomy depths that the attendant priestesses delivered their oracles. For their mystic and nocturnal rights, however, they abandoned the mainland and betook themselves to the rocky islet, to which the pagan name of the Druidical sanctuary was transferred when Christianity took possession of it and which is still known as Tombelène. The religious awe which it inspired has found an echo in the legends which have clung to it through centuries. In the Middle Ages the minstrels sang how the niece of a King of Brittany had been kept there by a giant and had died of her great grief. Later the peasants of the neighbouring coast related that a young girl of the name of Helen, not having been able to accompany her lover to England in the train of William the Conqueror, took her station on the rock to watch the receding ship which was bearing him away and never returned to the mainland. But nowadays the uncultured fisher-folk do not allow their imagination such wide scope. Their historical horizon is the French Revolution, and they have transformed Helen into the daughter of a general, during whose absence she was carried off by a sailor, and brought to live and die, and be buried on the islet.

Long after Druidism had disappeared from the land, and when the chiefs known in history as the Merovingian kings ruled over a part of what is now France, about the beginning of the eighth century, Aubert, a holy man, born of a noble family not far from Mons Tumba, was Bishop of Avranches. At that time the forest of Scissy still extended to Mons Tumba, and it was the bishop's frequent custom to betake himself to the solitary craig, and to spend whole days in prayer and meditation in the cavern which had once been a heathen sanctuary. One stormy night, when the moaning of the forest and the roaring of the waves were re-echoed in weird sounds within his lonely retreat, Aubert saw a glorious vision. He beheld an angel, clad in brilliant armour and with a golden helmet on his head, standing on the rock. With the point of the glittering sword which he bore in his right hand the heavenly messenger touched the summit of the cliff and sent it crashing into the sea. On the foundation of rock that was left there suddenly arose a lofty church filled with armed warriors, above whom hovering angels sang a marvellous melody. On awakening from his dream Aubert was greatly exercised in mind to understand what it might mean. For three whole days he fasted and prayed that it might be given him to interpret the message aright, and at the end of that time the same figure appeared before him a second time, and bade him erect a church which should

be dedicated to him. With his flaming sword the angel pointed to a passage in the book of the Scriptures which lay open on a ledge of the rock, and Aubert, turning to it, read, “And there was war in Heaven: Michael and his angels fought against the dragon: and the dragon fought, and his angels.” Still Aubert's doubts and hesitations were not dispelled, and he knew not whether his visions were messages from God or snares set for him by the spirit of evil. Once again the archangel came to him, and on this occasion touched the sleeping bishop's head, awakening him with the sharp pain that darted through his brain, and leaving the imprint of his celestial fingers on his skull. Other occurrences, too, confirmed the divine origin of the commission entrusted to Aubert. A bull pointed out the precise spot where the holy edifice was to arise and traced the limits of it; a rock, which human strength was powerless to remove, fell at a push from an infant's foot, and a stroke of the bishop's staff called forth a spring of healthful water from the solid rock. Then Aubert set himself to the performance of his task. As it neared completion he sent three of his canons to Monte Gargano, in Italy, for the purpose of bringing back with them a stone from the shrine which the archangel already possessed there. They were a whole year away. On their return the landscape was changed beyond recognition. The forest of Scissy had disappeared, and the Mount stood in solitary grandeur, in the midst of a waste, now of sand and now of sea.

Such is the Mount as it appears in tradition. History shows it in a light equally interesting, though less marvellous. According to the old chronicler, Dudo of St. Quentin, Richard I., Duke of Normandy, built on the Mount a church of extraordinary size, and after having expelled the canons regular, who held the earlier structure, and whose licentious lives gave great scandal, he called in a body of monks of the Benedictine order. Less than a century later, the monks of St. Michael's furnished six transports to Duke William. In 1335, the appointment of the abbot to be at the same time military governor shows the importance which the Mount had acquired as a fortress. During the long struggle between England and France it was the bulwark of Normandy, and the vassals of thirteen fiefs were brought together to defend it. It was three times besieged by the English, but held out successfully on each occasion. During the religious wars the Huguenots also made many desperate attempts to obtain possession of the stronghold, but they too were driven back.

Even whilst retaining its dignity as a fortress, the Mount occasionally served as a prison; and one notable Scotsman—Kirkcaldy of Grange—was for awhile a captive within its walls, from which, however, he succeeded in making his escape. There, too, if a doubtful tradition may be depended upon, Cardinal La Ballue was kept in the iron cage. With regard to one poor wretch, at any rate, the pamphleteer Dubourg, there is not the comfort of a doubt. In punishment for his attacks on Louis XV., he was shut up in the den which tourists may still see, and left to die of hunger and of exposure, his body, it is said, half-gnawed by rats. It was not, however, till the French Revolution that the time-honoured pile was degraded into a regular prison. It remained so for 70 years, and it is stated that between 1793 and 1863 more than 14,000 prisoners were immured in its dungeons.

Till within recent years Mont St. Michel could be approached at low tide only, and then not without some risk. So treacherous were the sands that runners familiar with them, and thoroughly acquainted with all the forewarning signs of danger, preceded the visitors' conveyance, and more than one who neglected or despised their services paid a heavy penalty in consequence. At present, however, a broad dyke connects the Mount with the mainland, and allows access to it at any tide, affording also an excellent approach from which the “marvel” is seen to great advantage. From the causeway a narrow bridge leads to the first of the three gates which guarded the entrance to the stronghold. It is called *la porte des Michelettes*, from the two guns standing near it as relics of the heroic siege sustained in 1434 by 119 knights with six men-at-arms each against 8,000 English assailants. To the right of it is still seen the guard-house, where every stranger entering the Mount was required to leave his arms before passing through the second or barbican gate, which a moat, with draw-bridge (now no longer existing), separated from the third and most important gateway—*la porte du roi*. It is in an excellent state of preservation even now. Its iron portcullis is still in the grooves, and faint traces of the abbatial coat-of-arms may still be distinguished on the escutcheon above it; indeed, but a very slight effort of imagination is required to figure it as it appeared when successive kings of France passed under it in pilgrimage to the abbey, or when the white-cloaked knights filed through it and up the narrow street on the vigil of their patron St. Michael's feast.

After passing the *Porte du Roi* the tourist finds himself in the one street of the quaint little town. Winding and circling between houses, of which the architecture takes us back to the days when they were hostels for the accommodation of

pilgrims, the narrow passage of steep inclines and steeper steps has brought us to the guard-house. Beyond its massive arches and spacious vault, we seem to be in the very midst of the feudal world. Through this Gothic window the archers of the Lord of Estouteville during the reign of Charles VII. watched the movement of the English army, and with spanned crossbow awaited the attack of the enemy. Gazing at the front of the basilica we are reminded of the early Normans, but lately converted to Christianity, who gave expression to their genius in architecture of solid and measured proportions, destined, like their influence, to bear the test of centuries. The tympanum over the porch takes us even beyond that, to Merovingian days, to the foundation of the sanctuary on the threshold of which we are standing. It represents Saint Michael appearing to Bishop Aubert in his sleep and touching his forehead with his finger. Though a modern reproduction, the work has retained an archaic simplicity thoroughly in keeping with the subject and the surroundings. Of the church itself it is difficult to get an adequate or even satisfactory notion. It is being restored, and besides being masked by scaffolding is made unpleasant by the sand and lime-dust inseparable from the work.

If we ascend the winding staircase of the belfry and reach the exterior platform formed by the leaden roof of a side aisle, we shall get a magnificent view both of the Mount itself and of its surroundings. St. Michael's Bay stretches out in the shape of a triangle, of which the sides are formed by the Norman and Breton coast, and of which the base is the ever-shifting line where the sea rolls over the sands. Below us the whole structure of the wondrous pile stands out in bold relief. On one side we can trace the winding line of its ramparts, on the other we have the sheer cliff, wild and weather-worn. Below us is an indescribable medley of towers and spires and buttresses and turrets, foreshortened into strange perspective, suggesting an immense chess-board looked at from above. But more striking than all is the effect produced by the mist which not infrequently rises from sea. Then the cathedral, isolated from its base, seems to rest on the clouds, like those mystic, apocalyptic cities which Mediæval artists introduced into their pictures.

One of the striking points of the abbey is its cloister. It is a delicate piece of thirteenth-century architecture, and its triple rows of small columns supporting a roof of variegated tiles have an appearance of remarkable lightness—almost of fragility. According to tradition they were carved by a prisoner of the name of Gaultier. He was promised his liberty as soon as the work was done, but by that time he had completely lost his reason, and taking a wild spring over the battlements was dashed to pieces on the rocks below. At the same spot an authentic attempt at escaping from the Mount was made by Barbès. The rope which he used was too short and he broke his leg in dropping from it. The dungeon in which he was locked up for forty-eight hours as a punishment for inciting his fellow-prisoners to mutiny is one of the sights shown to the tourist. It is a dismal den into which no ray of light falls and of which the walls, three or four feet thick, are built of solid masonry. And yet it was only the *petit exil*. More awful still is the *doublette* with the round aperture in the roof to give admittance to those who were never to leave it alive, and scarcely less gruesome the charnel-house, within which the brethren were buried. All these represent the gloomy and dismal side of the old structure—might we not say the entrails of the dragon upon which Michael set his foot? It is a relief to get back again to the larger halls, to the refectory, the dormitory, or the knights' hall. It was in the last of these that the members of the order founded by Louis XI. met, and its walls were once hung with the banners which now adorn the little village church.

But to describe the "marvel" in detail would be drawing up a mere list of halls and dungeons, of crypts and chapels. Nor is it in detail that, even after a careful visit, it can be remembered. What remains indelibly fixed on the mind is the imposing grandeur of the whole—of a pile which even now has not ceased to be the wonder of the West. To do it justice the visitor should spend at least one night at Mont St. Michel. He will then have an opportunity of witnessing the singular effect of the rising flood. From a distance of some ten miles the sea comes—not sweeping, but rather percolating in. It does not advance in one continuous line, but seems to rise from out the sands, and suddenly and silently makes its presence manifest where a few moments before there was no trace of its proximity. The guide-books grandiloquently state that the speed of its approach rivals that of a horse. That is an obvious exaggeration; but, apart from the treacherous nature of the quicksands, a pedestrian would have but a poor chance if his safety depended on his outstripping it, or even on keeping up with it.

Our stay at the Mount afforded another novel experience of an altogether different kind. Owing to the narrow limits of the town, the dependencies of the hotel are, so to speak, scattered about over the face of the rock, and a zigzag of fully hundred stone steps separated our quarters from the entrance

lobby. To meet the emergency Chinese lanterns are supplied, and with these, about ten o'clock at night, a party of five of us began a solemn, or rather anything but solemn, procession up the tortuous and steep path, to the accompaniment of much laughter.

To do the Mount thoroughly, and after the fashion of the *fin-de-siècle* pilgrim, yet another thing remains to be done—an omelette must be eaten. That is a specialty of the Mount; and truly, as it comes from the experienced hands of Mme. Poulard, it is a thing to be eaten with respect and to be remembered with pleasure. And the moralist may, if he chooses, find food for meditation also in the dainty dish, and grow eloquent over the contrast between the ancient glory of the Mount and, to quote the signboards, its present "renommée de l'omelette."

THE SOUTH KENSINGTON MUSEUM.

THE report of the Science and Art Department gives the following account of the principal acquisitions by purchase during the year 1893 for the South Kensington Museum:—

A collection of old English furniture was acquired for the sum of 500*l.*, the most important specimen being the front of a coffer, carved in very high relief with subjects representing the story of St. George and the Dragon. This panel dates from the fourteenth century, and is very similar to the front of a chest preserved in York Minster. The model of a portion of the Sala del Cambio at Perugia was completed during the year by the addition of the remainder of the frescoed wall against which the *bancone* (received in 1892) stands, one bay at right angles and a portion of the ceiling. The model had been commenced by the late Cavaliere Annibale Mariani, and was finished by Count Lemmo Rossi Scotti, at a total cost of 1,000*l.* The most important acquisition during the year was a very large and magnificent Persian carpet, measuring 34 feet 6 inches by 17 feet 6 inches, bought for the sum of 2,500*l.* The Department was, however, assisted in this purchase by the generosity of Sir A. W. Franks, K.C.B., Mr. E. Steinkopff, Mr. William Morris, Mr. John Edward Taylor and other gentlemen. This most remarkable work of art came from the mosque at Ardebil, and bears the date A.H. 946 (A.D. 1540), with an inscription stating that it was the work of Maksoud of Kashan. A treasure-trove has been transferred to the charge of the Museum by Her Majesty's Treasury, at a valuation of 175*l.* It consists of seven pieces of silver plate, dating from 1578 to 1696. These specimens were found in a rabbit-burrow at Stoke Prior, near Leominster, Herefordshire. A collection of Hispano-Moresque earthenware, comprising 120 specimens, was purchased for 797*l.* A Japanese room, which had been on loan for some time at the Bethnal Green Museum, was acquired for the sum of 70*l.* At the sale of the Bateman Collection twenty-one works of art were secured, including a Limoges enamel triptych of about the year 1500, a carved ivory group of the Coronation of the Virgin, an Italian chalice enriched with enamels and dated 1365, two German silver-gilt cups and a portion of a girdle in enamelled gold—at a cost of 609*l.* 2*s.* 10*d.* A leaf of a Limoges enamel triptych painted *en grisaille*, representing part of the subject of St. John the Baptist Preaching in the Wilderness, was bought for 120*l.* The other two leaves had been for many years in the Museum, whilst the third leaf had been the property of M. Spitzer. The principal purchase at the sale of the celebrated Spitzer Collection, which took place in 1893 in Paris, consisted of a beautiful cover of a Textus or MS. of the Gospels, overlaid with gold plaques, and enriched with *cloisonné* enamel work and precious stones (1,571*l.* 10*s.*). At the same sale a magnificently-worked English rim-lock, made by Richard Bickford, of London, and bearing the Medici arms, was secured for 183*l.* 14*s.*, as well as an enamelled pendant jewel in the form of a ship for 157*l.* 10*s.* At the sale of the Baron de Cosson's arms and armour the following specimens were bought for the sum of 281*l.* 3*s.* 3*d.*:—A German wheel-lock pistol, inlaid with staghorn and dated 1579; an engraved steel casque of Italian workmanship of about the year 1535; a steel chanfron from Spain, engraved and gilt, of the first half of the sixteenth century; a leather powder-flask and two priming-flasks. From the Field sale were obtained a boxwood group of the Virgin and Child in the style of Martin Schöngauer for 88*l.* 4*s.*, and a pair of Limoges enamel salt-cellars for 518*l.* 3*s.* 6*d.*, the work of Jean Limousin, who was working in the early years of the seventeenth century. Sixteen specimens of Rhodian pottery were bought for 200*l.*, and a Florentine bronze bowl of the end of the fifteenth century cost 70*l.* A valuable collection of early textile fabrics, including stuffs woven at Byzantium, Palermo and Lucca, as well as a magnificent altar-frontal of Lucca workmanship of the fourteenth century, was acquired for 948*l.* 12*s.* 4*d.* A large Brussels tapestry worked with subjects from the Court of Love, War and Religion, was obtained for

3154., and a very representative collection of German ironwork was bought for the sum of 650*l*.

The principal gifts received during the year were:—A steeple-shaped hat of the time of James I., given by Mr. J. Seymour Lucas, A.R.A.; a terra-cotta bas-relief of the Virgin and Child, given by Mr. C. Fairfax Murray; models of a tapestry and a carpet loom, given by Mr. William Morris; a plaster ceiling from Crosby Hall Chambers, given by the directors of the Bank of Scotland; a carved ivory figure of Our Lord for a crucifix, French, early eighteenth century, given by Captain C. Waldo-Sibthorp; and a German enamelled earthenware stove, given by Mr. Henry Willett.

The reproductions acquired in 1893 comprised twenty-four plaster casts, viz.:—A copy of a head of Hera, of the school of Polycleitus, discovered on the site of the temple of Hera in the Heraion, near Argos, and presented by the American School of Classical Studies, Athens; a copy of the head of the bronze lion of St. Mark on the Piazzetta, Venice; the group of *Judith and Holofernes* by Donatello, in the Loggia dei Lanzi, Florence; a recumbent effigy of Beatrice d'Este, attributed to Cristoforo Solari, in the Certosa, near Pavia; a relief of the Virgin and Child, with the young St. John the Baptist, by Bartolommeo Bellano (acquired in exchange from the Berlin Museum); a copy of a portrait in relief of Andrea Mantegna, from his tomb in Padua; a portion of the portal of the north transept of Bordeaux Cathedral, date about 1300; and a French carved wood door of the sixteenth century. A cast was also obtained of a fireplace, dated 1633, formerly in Crosby Hall Chambers, London; there was also a collection of 477 reproductions of Italian, French and German medals cast by M. Liard.

For the Indian section forty-eight objects were purchased, at a cost of 178*l*. 9*s*. 6*d*. Of these a small collection of old Newar metalwork from Nepal, a collection of metalwork and glassware formed by Lieut.-Colonel Cole at Bijapur, and a gold "rose" chain of the eighteenth century were the most important. Works of art were also presented by Mr. N. P. Anthony, the Misses Palmer-Lovell, Mrs. Ella Sandford, General Sir W. M. S. McMurdo, G.C.B., and Mr. A. F. Sealy.

Mr. Weale, the keeper of the Art Library, reports as follows:—The number of volumes and pamphlets acquired has been 1,808, 346 of which have been presented and 1,462 purchased. The most noteworthy are:—Baron A. Liedts's "*Anticennes Dentelles Belges*," Antwerp, 1889-90. Privately printed. F. Moreau's "*Album Caranda*," 1879-93. "*Oriental Carpets*," published by the Imperial Museum at Vienna. "*Virgil Solis*," "*Biblische Figuren*," Frankfurt a/m, 1560.

The number of drawings acquired has been 861, seven of which were presented. The most noteworthy are 104 sheets of Mediaeval costume drawn and coloured by Mr. Lake Price. Nine hundred and fifty-three prints have been added to the collection and 1,289 photographs.

The new general reading-room catalogue, embodying in one alphabetical series all the books acquired before September 1890, has made good progress. The first twenty-one volumes, down to MUE, are now at the disposal of readers.

During the past year 4,282 works have been catalogued and 5,208 slips printed. The titles of fresh acquisitions have been printed regularly every week, and these weekly lists posted up in the library, so that readers are informed of and can consult any book at the latest on the Saturday of the week following that in which it is acquired. Prior to my appointment volumes or series of volumes (periodical publications, transactions of societies, &c.), no matter how many separate papers they might contain, received only one general mention in the catalogue. Since that time every volume has been examined, and each article or paper in any way relating to art has also been catalogued independently.

Moreover, at the same time an abbreviated copy of the title of every work is prepared by the cataloguer for insertion in each of the classed lists to the subject of which its contents may refer. These classed lists are thirty-three in number; one of them is almost ready to send to the printers and two others are in a forward state. Cut-up copies of these will be placed in the reading-room for the use of readers, fully press-marked and kept up to date by weekly insertions.

Special provisions have recently been made for the benefit of students. A new room has been prepared for the use of those who wish to copy in water-colours, or to consult rare books, prints or photographs. Arrangements have been made so that they can avail themselves of these advantages in the evenings on which the museum is open, while previously it was not found possible to permit the use of water-colours after dusk.

A catalogue of the Japanese books and albums of prints in the library has been published this year. The titles were translated and written by Mr. Kowaki, and revised and seen through the press by Mr. Strange. The catalogue of loose prints and drawings which is to form the second part of this Japanese catalogue is also nearly completed and will be published shortly. Students of ornament and designers have

found very useful a series of proofs taken by means of photography from the large collection of Japanese stencils in the library.

The rearrangement and classification of the contents of the bookcases is making good progress.

FOLKTON CHURCH.

THE parish church of Folkton near Scarborough is now being partially restored. The works which are at present being carried out are the repairs of the masonry of the inside of the church and also the walls. The floor of the church is being lowered to its original level and the alleys repaired with rubbed flags, the floor of the sacarium being tiled. The nave of the church will be seated with open benches, and stalls are being placed in the chancel, and new altar rails and standards, and there is to be a new pulpit. The wood windows on the south side have been replaced with stone ones of fifteenth-century character, and a new door is also to be placed on this side of the church. The whole of the works are under the superintendence of Messrs. Smith, Brodrick & Lowther, architects, of Hull, and the contract is being carried out by Mr. R. Kilvington, of Nafferton, and Mr. Rudd, of Duffield.

CHURCH BUILDING AND RESTORATION.

Bridlington.—A new Catholic church was opened by Cardinal Vaughan on Thursday. The building has been designed by and carried out under the superintendence of Messrs. Smith, Brodrick & Lowther, architects, Hull. The church is in an early style of Gothic architecture, and consists of a nave, 54 feet long by 17 feet wide, with north and south aisles, 8 feet wide, and at the end of each aisle is a side chapel; one is dedicated to the Blessed Virgin, and the other to the Sacred Heart. Each chapel has above the altar and at the side beautiful tracéried stone windows, which have been filled in with stained-glass; the roofs are groined with the best selected pitch pine boards and moulded ribs, which terminate with a carved boss. The sanctuary is 20 feet in length and 17 feet in width, and has an octagonal apse with tracéried stone windows, and is divided from the nave by a lofty arch resting on clustered shafts of polished Derbyshire marble, and capitals richly carved in Early English foliage and moulded bands and bases. The arches separating the sanctuary from the side chapels are filled in with tracéried oak screens. The nave is divided on either side from the aisles by arcades of four bays with moulded arches on octagonal shafts of Hopton wood, polished stone, and moulded caps and bases. The nave has a clerestory of lancet-headed windows, and the aisles are also lighted by similar shaped windows. The choir gallery is at the west end above the main entrance, with an organ chamber at one side. The west front of the church is the most prominent feature; it is built of the best red stock bricks and stone dressings, and the massive angle buttresses terminate in lofty pinnacles of stone. A long two-light tracéried window and a single light on either side fill the gable above the western entrance, carved stone niches are fixed between the centre and side windows for statues of the patron saints. The gable is coped with moulded stone, and the apex is a finely worked cross. There is a large working and private sacristy, and in a recess in the aisle wall is the confessional. A large heating chamber is formed below the sacristy for a high-pressure heating apparatus. Accommodation is provided for about 800 adults.

GENERAL.

Sir H. de Trafford, Bart., has given a site in Liverpool Road, Eccles, for the erection of a new Catholic church.

Sir Edward Landseer's house in St. John's Wood is to be pulled down, the site being required for the new railway.

Rev. Dr. Paton and Mrs. Paton, of Nottingham, have offered 1,000*l*. for a new wing to be added to the Children's Convalescent Home, West Kirby, Cheshire, in memory of their son, W. P. Paton, West Kirby, whose recent death at Barmouth evoked great regret and sympathy.

The Design of Mr. R. Knill Freeman has been adopted for the Central Higher Grade School, Bolton. The design by Mr. J. Simpson was placed second, and one by Messrs Woodhouse & Potts was third. The building is to be four storeys in height, and the estimated cost is 20,000*l*.

The London County Council have selected Dr. Collins and Mr. T. Blashill as representatives at the Hygiene Congress in Buda Pesth.

Balderton Hall, a sixteenth-century mansion in Shropshire, with an estate of 352 acres, has been purchased by Mr. T. Parker Farden, of Chester, for 13,200*l*.

The Architect.

THE WEEK.

A MEETING of the Governors of the Richmond Lunatic Asylum, Dublin, was held on Tuesday. It is proposed to erect a new asylum at Portrane, but an extension of the Richmond Asylum is also contemplated, which alone will cost 65,000*l*. One of the Governors considered that the wisest course would be to sell the asylum and to remove all the patients to Portrane. A decision on the subject cannot be given until the financial question is determined. It was therefore resolved, "That the Chief Secretary be requested to ascertain from the Treasury and inform the Board what relief will be conceded under the recently passed Act in the rate of interest charged on advances to lunatic asylum buildings. This Board having in view the necessity of being soon obliged to provide a sum not likely to fall far short of 200,000*l*., hope that this matter will be promptly and generously dealt with by the Government, who appear to be making a considerable profit out of loans for lunatic asylums; while in the opinion of this Board they should afford from any available funds aid towards keeping down the heavy consequent taxation."

IN the speech which Mr. WYKE BAYLISS delivered in responding to one of the toasts at the dinner to the hangers of the Autumn Exhibition, which was given by the Liverpool Art Club, he was happy in a comparison which was suggested by the architectural subjects to which he devotes his talents. He said:—"Art is like a great cathedral, with its choir, its transepts, its nave, its aisles, its little chapel, each one beautiful in itself, but the whole a splendour than which there is no greater splendour in the world. In the case of art there is the choir—that is the Royal Academy, where the 'Te Deums' are sung and the incense is offered. There are the transepts; they are the two water-colour societies, always by the very fate of the scheme placed as far away as possible from each other. There is the nave; it is the Royal Society of British Artists, built seventy years ago, and as strong now as ever it has been in its career. There are the aisles and the little chapels; that is, the splendid work done in our provincial societies, the little chapels, mind, the little chapels of Newlyn and Glasgow and Liverpool, if you will—the little chapels where the miracles are wrought, that is the point. That is where the miracles are wrought—miracles of daring at Newlyn, of colour in Glasgow—miracles of all kind of splendid work." A cathedral makes a city, but Mr. BAYLISS rightly considered that art was not bounded by city walls or frontiers; and if there is, he said, "one overmastering feeling in my mind with regard to art, it is this, that art is not metropolitan, that art is not provincial, that art is not in its highest sense even national. Art is greater than a city, than a people, than a nation; it is cosmopolitan. Every splendour of thought the world possesses should be swept into the treasury of art; and yet while this is true, it is also true that art is in its splendour in a nation when it is strong in its cities. When art was greatest in the Renaissance there was a school at Venice, a school at Naples, a school at Florence; not merely a school in Rome; and it is so now. Our hope for the future does not lie in what we are doing in London, but what our nation is doing in Edinburgh, in Glasgow, in Newlyn, in Manchester, in Nottingham, in Bristol, in many other places, and above all in Liverpool." The position assigned to Liverpool work will not be generally approved, but allowance should be made for the circumstances which accompanied the speech.

MEISSONIER, the painter, never appeared to be a man who could have romantic visions, for a painter who was so absorbed in microscopic details must have been a realist. But he was a visionary when he erected his mansion at the junction of the Rue Legendre with the Boulevard Malesherbes. He intended to create the most wonderful Renaissance house in all Paris. It was to be designed by himself

The furniture was to be copied from examples selected by him. He intended to carve some of the great chimney-pieces. The staircase was to be adorned with frescoes painted by him. So far his dreams were like those of a great many artists. But MEISSONIER was not satisfied with them. After creating the mansion and making of it a shrine for the paintings he withheld from amateurs, and the countless studies which he had so long concealed, he intended to offer the building and its treasures to France. But in return he expected the State to pay him a revenue that would be adequate to his requirements, and to provide for his descendants by making them in succession the conservators of the property. France has sufficient responsibilities without undertaking one so onerous. A number of circumstances to which we need not refer caused the dispersion of MEISSONIER's property after his death. The house which was built partly to serve the painter's needs, which were peculiar, and partly as a museum, was not adapted to become the residence of ordinary mortals, however wealthy they might be. It was remarkable without as well as within, but as commonly happens with the works of amateur architects it could not be transformed. The site is undoubtedly very valuable, but in order to utilise it MEISSONIER's Parisian home is now being demolished. In a short time every trace of it will be removed. The stone and wood which the painter had elaborated to satisfy his fastidiousness will be scattered far and wide.

THE operations on the site of the Temple of Hera or Juno, near Argos, having been suspended until next spring, a special correspondent of the *Times* has sent an account of what has been accomplished. The excavations, which were commenced in February 1892, were carried out by the American School of Archæology, with the aid of about two hundred and fifty labourers, under the direction of Dr. WALDSTEIN. The site is on a slope of Mount Eubœa, and the temple and surrounding buildings must have been most impressive when seen from the plain. The explorations on the site of the older temple have revealed, says the correspondent, a pavement of large polygonal slabs, some 45 metres in length by 35 in breadth, covering a considerable portion of the terrace supported by the cyclopean retaining-wall. Whether this pavement lay in front of the temple or supported its columns it is impossible to say, as no traces of foundations have been discovered such as might enable us to reconstruct the design of the building. The only vestige of the temple which remains is a portion of wall which apparently formed part of the substructure of the cella. The later temple is not so much of a puzzle, for "enough of fragments remain from all parts of the building to enable us to form a fairly accurate idea of its construction and architectural features. It was a Doric peripteral hexastyle, with twelve columns on the flanks, and with a stereobate measuring 39·60 metres by 19·94. The ratio of length to width is thus somewhat less than in the Parthenon, and falls in with the general rule that this proportion decreased from earlier to later times. The columns were of porous stone, with a fluting of twenty channels, the echinus of the capital showing a delicate convex curve. The entablature was also of porous stone, with the exception of the triglyphs, which, as well as the pediments, were of black marble. The sculptures in the metopes and pediments were of Parian marble, and we know from PAUSANIAS that the subjects which they represented were the birth of ZEUS, the Gigantomachia, the expedition against Troy, and the capture of that city. A long stoa has been revealed containing a range of at least nineteen pillars, some of which were found *in situ*. The stoa appears to have been filled with statues, the bases of which remain, and at its western end a very curious series of waterworks has been discovered. Terra-cotta idols, plaques and images of animals, bronze statuettes, rings and pins, beads, scarabs and seals of amber, glass or porcelain, together with other objects, some belonging to the archaic period and others to the remotest antiquity, have been found literally in hundreds." The most interesting of the fragments of sculpture is a head of a warrior, which has characteristics that correspond with those ascribed to the works of POLYCLETUS.

THE SAINT-AUBIN FAMILY.*

THE interest which the works of the minor French artists of the eighteenth century have revived cannot be altogether ascribed to their intrinsic merits. If they had lived at an earlier or later period, FRAGONARD, GREUZE, PRUD'HON, the MOREAUS, the COCHINS and others would probably be comprised with the crowd of artists who have had a brief spell of reputation among their contemporaries and then passed into oblivion. They are now considered as if they were actors employed in some "curtain raiser" while a great tragic spectacle was in preparation on the same stage. It seems incredible that men could be merry and occupy themselves with pastoral and idyllic scenes regardless of what was so near. Since art began there were no such troops of amorini produced as we find in the French designs of that period, and they became almost countless as the time of the Revolution drew nigh. In the most high and palmy state of Rome, according to SHAKESPEARE, before the death of the mightiest JULIUS, the sheeted dead did squeak and gibber in the streets, and "the like precursor of fierce events" was witnessed elsewhere. If the drawings of artists might be relied on as evidence, it could be supposed that the events of 1789 were immediately preceded in France by a revival of the golden age, and the prologue to the tragedy was accompanied with the pipes and tabors of Arcadian shepherds and shepherdesses.

The family of the SAINT-AUBINS were among the artists who were chosen by destiny to delude men and make them believe that France was happy and joyous. They sprung from the class of men who suffered most in the last days of feudalism, viz. the small farmers. The first who abandoned the peasant's hut to seek after fortune in Paris somehow acquired the art of embroidery, and as a craftsman entered the service of the Duchess LESLIGUIÈRES. His frames were set up in the porter's lodge, and he was consequently able to act as concierge. His son, GABRIEL-GERMAIN, born in 1696, was also taught the art and became "brodeur du roi." That dignity brought him privileges rather than money. He was not subjected to the laws and regulations which weighed in those days upon the ordinary citizens of Paris. On the other hand, he may have despised the citizens' thrift, for, like all the royal tradesmen of whom we have read, he died in poverty. He left five children, who were free to follow art. CHARLES-GERMAIN became one of the royal draughtsmen. GABRIEL followed painting, and occupied himself in sketching in all times and places, but he was "singulier, farouche et malpropre," and therefore not adapted to shine in salons. LOUIS-MICHEL was a painter at the Sèvres factory; ATHANASE was attracted by the stage; AUGUSTIN, who was a designer and engraver, was elected into the Académie Royale, and was appointed royal engraver. It is not necessary for us to take any further notice of the lives of LOUIS and ATHANASE.

The drawings by CHARLES which have survived, and the engravings from his designs, are evidence of the admiration for flowers which is still a characteristic of the industrial arts in France. He prepared a portfolio of copies of plants containing 250 water-colours, which occupied his intervals of work during forty years. He etched a collection of "petits bouquets," in which flowers are mixed with various forms, and another of Chinese flowers and caprices which were his own invention. He prepared also a series of monograms made up of plant-forms, which are interesting not only from their elements but as emblems of the tributes which the earth was supposed to offer to the French nobles. A more useful work was the treatise on the art of embroidery produced by order of the Academy of Sciences, in which the plates are masterpieces of their class. CHARLES DE SAINT-AUBIN was the fashionable designer of his time. He was patronised by Madame DE POMPADOUR, and the noblest ladies in France showed their loyalty by obtaining his aid. In his old days he discovered that he was only one of the slaves of fashion, and therefore could not expect to have any claim to fame. "My forty thousand designs," he wrote, "after serving to guide embroiderers and manufacturers of stuffs and laces, have entered into nothingness, where I shall soon rejoin them." He was, however, a sort of

philosopher, who believed that as all men and women are merely players, amusement was to be gained by every wise looker-on. His favourite resort or puppet-show was the sale-room for bric-à-brac, where he saw many comedies. He knew all the performers, he said, as well the strings by which they were worked, and was willing to admit that as they amused him he also served in turn for their enjoyment.

The "farouche et malpropre" GABRIEL was more of a genius. He tried to follow the beaten track to Rome under academical guides, but he broke down on the way. Under the influence of ambition he produced Homeric and scriptural freaks, but nobody's feelings were oppressed by them. SEDAINE, the dramatist, had taken his measure exactly when he advised him to leave epic subjects and stick to trifles:—

Quelque sujet tendre ou galant,
Un rien, une esquisse légère,
Sur ce carré de papier blanc.

Yet the scraps of white paper have a better chance of surviving than most of the great oil-paintings of that age. It would be difficult for any man to have more of the passion for recording things. Many inhabitants of the city must have looked on him as a lunatic. He would be a worthy companion for the "Nephew of Rameau." He was to be seen everywhere in Paris filling his sketch-book. He was engaged in the task while going from one scene to another. No place was sacred for him. In a church he was regardless of the distraction he caused so long as he secured materials for a sketch or two. The preacher might exclaim when he saw the congregation less intent on his oratory than on the operations of the shabby man; but GABRIEL was indifferent. If a grandee would not let himself be sketched, the artist contrived to get behind the screen in a dining-room, and, regardless of the Bastille, accomplished his task. Many thousands of the sketches were found after his death in his room in the house of a cabinet-maker in the Rue de Beauvais, but only a few can now be identified. Their value must excite regret for the disappearance of so large a mass of documents which as records would surpass any chronicle of the time. For GABRIEL, although he might appear to be more uncivilised than a Huron, was able to seize the momentary actions of the most refined people of Paris. In his representation of the spectacles in which they took part there is not an ungraceful attitude. The open-air balls may appear to be on the edge of a volcano, but a master of the art would testify to the accuracy of the steps and the exalted deportment. His etching of the Salon of 1753 would serve for this year. There is the same anxiety among ladies to display their robes, the same desire to find fault with details of costume, the endeavour to be seen rather than to see on the part of the majority, and the occasional efforts of a few to appear carried away by their admiration of the pictures. As became a man who was "singulier," GABRIEL DE SAINT-AUBIN was probably more happy when he was immortalising the street scenes which suggested the weakness of the police, or the tumble-down booths in the fairs or on the Pont Neuf, the latter being the perquisites assigned to the widows of the Academicians of St. LUKE. He seems to have found delight in the contrasts which the streets offered, and in which GABRIEL himself, with his hair as well as his stockings touched up with white crayon, was as bizarre a figure as could be found. A man of his character was a suggestive study for the comedians, and in return he represented many a theatrical scene. He had reason for his interest in the stage, for one of his nieces, a daughter of the porcelain painter, was an actress. Afterwards she married CLAUDE ALEXANDRE RICHARD, an architect who, according to the family register (appended to the collection of drawings of plants), was a handsome man who possessed "une belle clientèle," but who lost it and his fortune also through his neglect of order and arrangement. It may be mentioned here that GABRIEL was closely associated with architects, for he taught drawing in BLONDEL'S own school, which was well attended by students.

There was, perhaps, less genius in AUGUSTIN DE SAINT-AUBIN, but what he possessed was better disciplined and was more useful to his contemporaries. His first teacher was his eccentric brother GABRIEL, who endeavoured to make of him an engraver of historical pieces. He worked at plates under the direction of FESSARD. Becoming acquainted with GRAVELOT he was allowed to produce

* *Les Artistes Célèbres: Les Saint-Aubin.* Par Adrien Moureau. Paris: Librairie de l'Art.

vignettes after that designer's sketches, and those for the "Decameron" are among the most charming examples of book-plates. He was also fortunate in coming under the influence of LAURENT CARS, who was one of the best engravers of the French school.

At that time an engraver was more than an adept in mechanical reproduction. When AUGUSTIN DE SAINT-AUBIN commenced independent practice, he was as well able to design dainty vignettes as any of the specialists. The labels which he produced in his youth for the drawers of a cabinet of natural history belonging to the Duc DE CHEVREUX, and which were suggestive of the contents, denote much skill in decorative composition. It was easy for an artist who could impart that grace which befitted them to book-plates, invitations to spectacles, business cards and other miniature works, to obtain commissions in those days. The patronage of the aristocracy was the best testimony to his ability which AUGUSTIN could have obtained. In his designs he appeared the refined gentleman. Like his uncle, he drew indoor and outdoor scenes, but while GABRIEL introduced occasional cynical touches whenever he presented a crowd of grandes, the younger artist carefully avoided everything that suggested a want of reverence. It was becoming to hide GABRIEL behind a screen in a salon, but the nephew could be allowed to appear, whether he was treated as a guest or a valet. As DICKENS'S Mr. CHOPS said, "It ain't so much that a person goes into society as that society goes into a person," and AUGUSTIN DE SAINT-AUBIN seemed to have imbibed so much of it that all his etching tools should have had silver handles. He was just the man to illustrate fashionable romances. It is no wonder that many artists who might consider him as a rival were anxious to secure his skill to engrave plates from their drawings. He could impart dignity to a portrait or to an assembly of figures, and in consequence COCHIN, who possessed a sort of concession of court ceremonies and royal portraits, made him a co-operator.

The *savants* of the time appreciated him not less than the masters of ceremonies. The Abbé BARTHÉLEMY, the author of "Anacharsis," was the first among them who perceived that old coins and medals would obtain a novel interest if etchings of them were made by AUGUSTIN. A description of the engraved gems in the possession of the Duc D'ORLÉANS was brought out and two hundred plates for it were produced by the engraver. The arrangement of the subjects was due to the Abbé LE BLOND or the Abbé CHAU, but the engraver surrounded the medals with ornament that was novel. Those with figures of river gods are set in a collection of water-plants. SILENUS appears amidst grapes, wine-skins, &c. The punishment of MARSYAS is suggested by a knife, whips and a lyre. The attributes are not conventionalised, and if they appear to have more importance than the medals, it must be allowed that they form effective backgrounds. Many of the gems have great interest. One of them with MARS and VENUS engraved on it represents the goddess in a manner that has been taken as an indication of the Venus of Melos when perfect.

The Revolution brought suffering to AUGUSTIN DE SAINT-AUBIN. He was supposed to have been one of the satellites of the court and as such to have merited the contempt of all virtuous citizens. The French Republicans were as severe as the English Puritans in their treatment of artists. The designer and engraver was ignored, and if his life was spared it was only temporarily, for he was doomed to poverty and the privations he endured overcame him. When the Empire was established he had some faint expectation of patronage. Three months before his death he undertook a series of portraits of the kings of France from PHARAMOND to NAPOLEON, but it was a task that was unworthy of him. When he died his only property was his collection of engravings. A set of his own works, which to-day would be contested in the auction-room by the foremost amateurs and directors of museums, was sold for 4,210 francs. The proofs by other masters which he prized were sold for nominal prices. AUGUSTIN had ministered to fashion, which in its turn mocked him.

The works of the SAINT-AUBIN family are now difficult to obtain, and they have to be paid for at prices which are a testimony to their scarcity. In M. MOUREAU'S memoir

there are reproductions of 172 examples. Students and amateurs of limited purses may well be thankful for the enterprise which brings such a collection within their means. M. MOUREAU has already proved his competence to treat of the art and artists of the eighteenth century, and "Les Saint-Aubin" will increase his reputation as a scholar and critic.

SHOTTESBROOK CHURCH.

A PARTY of members of the Reading Archæological Society lately visited, according to the *Reading Observer*, Shottesbrook Church, where Mr. W. Ravenscroft read a paper, in the course of which he said:—We are assembled beneath the roof of one of the most perfect examples of late Decorated work which this country possesses; indeed, I very much doubt if it has its parallel when the many points of its completeness are taken into due consideration, for it is not merely in one or two respects, but in at least half a dozen, that this perfection is evident, as in the course of the few remarks I have to make I shall endeavour to show. Let me briefly enumerate the points of perfection to which I have alluded. At first observe the plan. It is that of a complete cross, with the peculiarity that the nave, which represents its stem, is shorter than the choir, which represents its head, the reason for which probably lies in the scanty need of accommodation for the population of the parish. Next, it is entirely built in one style of architecture, and, so far as the old work is concerned, rigidly adheres to that style throughout, even to the font and the smallest details. Thirdly, its proportion is exquisite, and seen from the park how serenely it stands in the simple dignity of its matchless beauty. It is a little church, but it has not the suspicion of a plaything about it. Fourthly, its simplicity of detail is truly remarkable, and yet how rich it is. There is scarcely a bit of carved work; no deeply-recessed mouldings with strong lines of shade, even its freestone is as sparingly used as possible, and yet it has not in it a suggestion of meagreness. Fifthly, its situation is unique. And lastly, it is exactly what was wanted for its purpose, for although a parish church it was not that primarily, as we shall presently see. Let us hastily trace the history of this interesting building. It had a predecessor, probably Saxon or Norman, for mention of such is made in Domesday Book, but it was not valued very much, for Hearne, as the result of his reading, finds it described as "far less decent and beautiful" than the present church. So in the year of our Lord 1337, Sir William Trussell, of Cubblestone, in Staffordshire, founded a charity or college for a warden, five priests and two clerks, and built them this church in honour of St. John the Baptist. The institution is endowed with a rent-charge of 40s. per annum on the manor, of which he was the lord. Shortly after its foundation the college buildings were almost destroyed by fire, in consequence of which misfortune the church of Basildon and other lands were given for its support; so the little institution lived on until the reign of Edward VI., when in the year 1547-48 it was suppressed, the revenues then being estimated at 32*l.* 18*s.* 8*d.* clear yearly value. The college was placed on the south side of the church, and the remains of a small doorway in the south-west angle of the south transept with a filled-up gap in the garden wall opposite will indicate the way of approach from the domestic buildings to the church, a way which at one time was enclosed with a covered passage, which Hearne mentions as having been talked of when he was a boy, and by which the people from the farmhouse occupying the site of the college came into church. At the suppression the lands of the college were granted to the Weldon family and subsequently came into the hands of the Vansittarts. The only portion of the church which seems to have been removed is the sacristy, the doorway to which may still be seen as a recess in the north wall of the chancel. I cannot find when this was removed, and the exterior of this doorway, together with the buttress built over it, are so cleverly managed as largely to destroy the evidence of there having been a sacristy at all. The spire has been rebuilt within my own recollection, it having fallen into a sad state of decay and indeed become dangerous. It is well worth while to ascend the turret stairs, both for the sake of the view from the parapet as well as to look up into the interior of the spire, the construction of which is an interesting piece of work. The restoration of the spire, I remember well, raised a good deal of criticism, especially as to authority for introducing the spire lights and omitting the pinnacles. After all, however, I think it must be admitted that the spire is a very handsome one, and it is only to be wished the late Mr. G. E. Street had been as happy in the other portions of his restoration, especially the chancel screen and pulpit, as in this his much later work. And by the way, the mention of the chancel screen raises the question as to where stood the rood-loft. I am inclined to think, with our worthy treasurer (the Rev. J. M. Guilding), that it was across the westernmost arch of the tower and then could have been approached by means of the turret staircase. Not only so,

but the evidence of subsidiary altars in the transepts would naturally, although not necessarily, help to point out this archway as the proper place for the holy rood. It now only remains to offer a few brief remarks on the monuments and brasses in which this church is really rich. The most important of these is, of course, that of the founder, Sir William Trussell and his wife Maud, the daughter of Sir William Butler, Lord of Weunne. It occupies the whole of the north end of the north transept, and consists of a double altar-tomb, with rich canopy-work over it cut in chalk. There are no effigies, but at one time the shields in the canopy were emblazoned. In the days of Hearne, through a defect in the wall the remains of the founder and his wife were to be seen, the former in the westernmost tomb wrapped up in lead, and his wife in leather at his feet. The monument to William Throckmorton, warden of the college, is a very curious one. It is situated against the north wall of the chancel, and consists of an effigy considerably under life-size, attired in a long gown, with doctor's hood and cap, having hands conjoined, and in a stone coffin. The most important brass is on a large slab, and represents two male figures. It is described as having been in the centre of the chancel, and its present position, if it has not been shifted, would add emphasis to the suggestion that the rood-screen was across the western tower arch. The figures are those of two elderly men, singularly alike, but one is evidently a priest and the other a layman. The work also is doubtless of the fourteenth century, but there is no inscription left to tell us who are represented by these figures. The supposition, however, is that the one is a memorial to the first master of the college, and that his brother is commemorated by the other. It is remarkably fine, especially in its architectural work. There are monuments to the Cherry family, whose hospitality to the non-juring clergy of the reign of William and Mary made Shottesbrook House the famous rendezvous it became in that time of trouble, and here also lies the learned Henry Dodwell. Hearne speaks of yet another tomb, which he calls that of the architect, of whom he tells the story that, having completed the spire, he called for wine and ale to drink the king's health, which having been drunk at the top of the spire, he accidentally fell and was dashed to pieces.

DISCOVERIES IN CRETE.

AN interesting account appears in the *Times* of Wednesday, by Mr. A. J. Evans, of his archaeological discoveries in Crete. He has obtained over eighty different types of hieroglyphic stones. Mr. Evans says:—They divide themselves into classes, such as parts of the human body like the eye or leg; of animals, as the head of a wolf or ibex; implements and weapons; ewers or other vessels; a kind of primitive lyre formed of two horns with cross strings; parts of dwelling-houses, such as gates or shutters, floral and vegetable designs; moon and stars and various geometrical motives such as crosses and concentric circles, besides indeterminate figures. But this is not all. On some of the stones the symbols take a more linear or alphabetic form, the origin of which in certain cases actually be traced, from its occurrence in a pictographic form on other examples; in this way, for example, the gate symbol, the double axe and the dagger are simplified before our eyes into purely linear outlines. These alphabetic symbols I was further able to trace on other materials. They occur as *graffiti* on vases of Mycenaean age, as marks on axes, and finally on the blocks of a prehistoric building with complicated passages on the site of Knosos—perhaps a palace, perhaps the actual “labyrinth” of Cretan tradition. Several of the same signs reappear on the fragments of early Aegean pottery found by Professor Petrie in Egypt, amidst relics of the twelfth and eighteenth dynasties, and these Egyptian parallels are made the more interesting by the fact that from a Cretan deposit at Phaestos containing a rude steatite whorl with strangely alphabetic symbols, together with stones approaching in character to the Cretan hieroglyphic series, I noticed several imported Egyptian scarabs of twelfth dynasty date—belonging, that is, to the middle of the third millennium before our era, while the latest elements in the deposit did not seem to come down beyond 1800 B.C. From other evidence into which it is impossible to enter here, it appears that the Cretan symbols, both pictographic and linear, belong in the main to the second millennium B.C. and to the days of the Mycenaean civilisation. The linear forms, indeed, find parallels in certain *graffiti* on vase handles from Mycenae itself. In another direction they seem to have actually survived as a vehicle of Greek writing to a much later date. Several of the symbols are, in fact, indistinguishable from those of the syllabic alphabet preserved by the Cypriote Greeks long after their more Western brethren had learnt the use of Phœnician characters.

The earliest of the hieroglyphic stones fit on to a still earlier and ruder series representing in some cases the actual owners of the signets—if such they may be called—who from the asso-

ciated attributes and figures seem to have been owners of flocks and herds of sheep and goats, warriors with spears and round shields, huntsmen, and in one case, if I mistake not, a man within a walled enclosure. We have here a glimpse of Cretan life in the third millennium before our era, and in the forms of the stones and the engraved objects we may trace besides more than one link between the Aegean islanders and the primitive populations of Asia Minor—comparisons which extend at least as far afield as Cilicia. Of the later Mycenaean class of engraved gems I was able, thanks to a happy accident of Cretan superstition, to collect a considerable number. I found that the women called them “milk-stones” (*γαλόπετρας*), and wore them round their necks as charms of great virtue. I therefore made a house-to-house visitation in the villages, and by one means and another prevailed on many women to display their talismans. I soon discovered that ladies of a certain age were not altogether averse to parting with their “milk-stones” for a consideration, but with the young women it was a more delicate business. In some cases I succeeded in swopping stones of smaller archaeological value, the lactiferous qualities of which, however, I could safely guarantee. But not unfrequently all persuasion was useless, and the only reply was, “I would not sell it for ten pounds. Don't you see my baby?” One could not of course contend with superstition such as this, but even in such cases I was generally able to procure an impression of the gem. The evidence thus gathered amply shows that Crete was a principal centre of Mycenaean glyptic art. The subjects are most varied. Many gems such as those with lions and *agrimia*, or Cretan wild goats, record the prowess of the chase; others are of a more pastoral nature, and a Mycenaean prototype of the “Good Shepherd” appears bearing a calf on his shoulders. Vases with spouts and high beaks and two-handled goblets are of frequent occurrence—birds and butterflies, fishes and ships, *frutta di mare* in the shape of cuttlefish and crabs. Some of the subjects are of a heraldic or quasi architectural character—goats as supporters of a palm-tree, two lions on either side of a column, recalling the Lion Gate of Mycenae, the gabled fronts of shrines or houses. Here are griffins and minotaurs, scenes of cult and offering; and a gold ring, one of my most precious spoils, similar in form to the rings found by Dr. Schliemann in the Acropolis graves at Mycenae, seems to illustrate a kind of stone worship that still survives in India and elsewhere to the present day. The god, brought down by ritual and incantation, is seen descending on the sacred obelisk that thus becomes his temporary dwelling-place, or, in biblical language, a “Bethel.”

Proofs of early Egyptian contact continued to accumulate throughout my journey. I collected a whole series of early stone vessels, some of which are either exact copies of Egyptian vessels of the same material or direct importations from the Nile Valley. The occurrence of the twelfth dynasty scarabs is of great interest, not only as showing that the connection between Crete and Egypt goes back, approximately, to 2500 B.C., but as solving one of the most vexed questions in the history of European art. These scarabs present in its highest form of development—but several centuries before the date of the great days of Mycenae—a form of spiral decoration which is essentially the same as that of the Mycenaean jewels. Stone objects exhibiting the same form of decoration in a more primitive style have, however, already been found in the Aegean Islands, and here, in these Cretan deposits, stones of this early island style that precedes the Mycenaean occur side by side with twelfth-dynasty scarabs that supply the obvious model of their spiralliform designs. The later history of this decorative system cannot be touched on here. Carried in the wake of the early amber trade to the North Sea shores, adopted as a principal feature of ornament by the Bronze Age populations from Hungary to Denmark, the same spiralliform system was introduced into Britain by the Belgic conquerors and finally survived in early Irish art. These Cretan finds supply the missing link between the scrollwork of the Book of Durrow or the font of Deerhurst and the royal scarabs of Amenemhat I.

ST. NICHOLAS TOWER, NEWCASTLE-ON-TYNE.

THE following report by Messrs. Oliver & Leeson, architects, on the condition of the tower and lantern of St. Nicholas Cathedral has been forwarded to the finance committee of the Newcastle Corporation:—In accordance with your request, we have carefully examined the tower and lantern of St. Nicholas, and beg to report as follows. We find that the whole of the structure above the level of the lead-flat is in need of immediate repair. The cement which has been plastered over the stone and ironwork, principally round the octagonal corner pinnacles, has in places become detached, leaving the joints and ironwork exposed to the weather. The moulded string-course below the battlements has many of its vertical

joints open. In the battlements the beds of the coping-stones have in two or three places been disturbed, and where the iron ties, which bind the corners of the tower together, cross the battlements, some of the stones have been split by the corrosion of the iron. The small turrets and pinnacles in the centre of each side of the tower are in fair repair, and, with the exception of the pointing in one or two places, require little or nothing doing to them. The large turrets and pinnacles at the angles of the tower are, on the contrary, very much in need of repair and pointing. It is round these turrets that the iron ties used to bind the top of the tower together are fixed; the expansion and contraction of these ties, and the corrosion, have caused a good deal of dilapidation. Two of the vanes from the westernmost of the corner spires have been taken down, and some of the remainder are not in satisfactory condition.

The iron ties and wood beams which have been fixed across the tower at different times to strengthen it are, especially as far as the latter are concerned, much decayed. One end of one of the wood beams is very bad indeed. The iron ties have originally been wrapped with spun yarn coated with tar. If this covering had been regularly seen to and properly repaired, it would have been a protection to the ironwork; as it is, it has been neglected for years, the tar has all worn off, and the yarn only serves to keep the damp as long as possible round the ironwork, thus causing greater corrosion. The arches springing from the turrets and carrying the lantern appear to be in very fair condition, and, with one or two slight exceptions, need no repairs. One of the small flying buttresses which spring from these arches to the turrets at the corners of the towers is in a defective state. It has been coated with cement, and has an iron tie built in. As in other cases, the corrosion of the ironwork has thrown the cement off. In the lantern itself the most serious dilapidation is apparent. The iron saddle-bars, which have been used to tie in the mullions, have, by their corrosion, burst the mullions in two or three places. The piece of stone burst off and a portion of the saddle-bar are submitted herewith. This splitting away of the stone has left the upper portion of the mullion and the tracery above in an insecure condition, and steps should be immediately taken to restore the damaged portions of the work. We have ordered some battens to be temporarily lashed to the mullions to keep them in their place. The whole of the lantern requires pointing and thoroughly overhauling, especially where ironwork has been built into the stone.

We have not been able to reach the upper part of the lantern and spire, but will do so when further ladders and scaffolding are erected, and will then report to you as to the condition of this portion of the building. The cause of a considerable amount of the present dilapidation is without doubt the expansion and contraction and the corrosion of the ironwork which has been freely used to tie the structure together. This should have been periodically inspected and kept in good repair. We were on the tower when the bells were rung on Wednesday, and noticed a considerable, though not excessive, amount of vibration. The heaviest bell of all, however, was not being rung. Before giving a definite opinion as to the effect of the vibration upon the lantern, we should like to have the whole of the bells rung when the scaffolding is erected, and more careful observations can be taken at the top of the lantern and spire. We are of opinion, however, that in the present condition of the lantern the ringing of the bells should be avoided, because, as we have already pointed out, some of the mullions are loose, and anything in the nature of vibration must have a detrimental effect.

It seems to us that the following repairs should be commenced forthwith:—The vertical joints of the string below the battlements should be carefully grouted and repointed in cement. The coping-stones of the battlements, where disturbed, should be taken off, copper dowels inserted and the stones reset. All stones that have been split or injured by the corrosion of the iron ties should be taken out and replaced by new ones. The small turrets and pinnacles should be pointed, and the large turrets and pinnacles should have the cement which is peeling off removed, and all the beds and joints grouted and pointed in cement. The two damaged vanes should be restored, and all other vanes carefully examined and put into proper condition. This would probably involve the taking down and resetting of some of the stonework. All the ironwork used in the structure should be thoroughly cleaned and coated with the best anti-corrosive liquid. The small flying buttress between the main arch and the corner tower should be taken out and new stones put in, as has been done in the other three cases. We would advise that the whole of the mullions and transoms in the lantern be taken out, and the iron saddle-bars and straps removed; that the stonework be reused as far as possible, new stones being used to replace the damaged ones, and all the saddle-bars and ties be replaced by copper. The lead on the top of the tower also requires certain repairs. We would suggest that your committee should authorise us to arrange for Mr. Walter Scott to commence the work forthwith on a schedule of prices being agreed to.

BIRMINGHAM SCHOOL OF ART.

THE Birmingham Museum and School of Art Committee have issued the programme for the coming session, which will begin on Monday, September 10. At the central school morning, afternoon and evening classes are held on five days a week, and the course of instruction includes drawing, design, painting, modelling, architecture and the execution of designs in *repoussé* and kindred processes, *e.g.* niello, chasing, etching and engraving on metal, damascening and filigree; enamelling—*cloisonné*, *champlevé* and Limoges; wood and stone-carving, drawing for book illustrations, wood-engraving, embroidery and other needlework, terra-cotta, silver-casting, die-sinking, encaustic painting, leather-work, the making of decorative cartoons, working in fresco, gesso, tempera, oils, sgraffito, lithography, &c.; building construction and drawing, machine construction and drawing, the steam-engine, applied mechanics and geometry. Mr. W. H. Bidlake, M.A., the special lecturer on architectural history and design in building, will in future teach at the school on Thursday evening as well as on Wednesday, and Mr. Naughtin has accepted the teachership of certain technical processes connected with the special course for house-painters and decorators. Messrs. Docker Brothers have offered prizes of the total value of 20*l.* to students attending this course. Alderman Cook, Mr. Thomas Cond, and Messrs. Hukin and Heath continue their offer of prizes respectively for machine drawing, anatomical studies and *repoussé*. The general prize list, some of the syllabuses of lectures and some of the conditions for the award of scholarships have been revised. The programme contains the new minute of the Department of Science and Art as to the examination of designs executed in the respective materials for which they are intended. During the session Dr. Windle will give a special course of five lectures on comparative anatomy; Mr. Whitworth Wallis, F.S.A., a course of three lectures on "Sicily and its Art Remains," and Mr. C. J. Hart will lecture on "Old Chests." Mr. W. J. Wainwright, A.R.W.S., will distribute the prizes and address the students in February next. Several rearrangements have been made with regard to the branch schools. Detailed in the programme are the arrangements made with the Jewellers and Silversmiths' Association in reference to the admission and attendance of students at the Vittoria Street branch school. The Bloomsbury branch school of Art has been transferred from the Board school in Cromwell Street to that in Lingard Street. Branch schools will next session be held on five evenings a week at the Board schools in Balsall Heath (Tindal Street), Clark Street (Ladywood), Cowper Street (Newton Row), Dudley Road, Ellen Street (Brookfields), Harborne (High Street), Hope Street, Jenkins Street (Small Heath), Lingard Street (Bloomsbury), Moseley Road, Saltley (Highfield Road), Smith Street (Hockley) and at the special building in Vittoria Street.

TESSERÆ.

Gothic Doors and Windows.

IN Gothic doorways the side splays and the arch or arch-mouldings above may be enlarged or increased to almost any extent, and that without producing heaviness or looking like exaggerated decoration. In many instances the width of the splays or dressings around the opening is equal to the width of the opening itself; and in some the former even exceeds the latter. And this breadth of splay, it should be observed, constitutes a marked distinction between doors and windows in the Gothic style; for though the apertures of both kinds strongly resemble each other in general shape and design, the latter do not admit, under any circumstances, of anything like a similar enlargement of their external dressings. Never is a small window attempted to be made a principal and ornamental feature by means of a deep splay filled in with decorations; never is a large one placed within a wide and deeply-recessed splay, bearing the same proportion to the aperture as the respective parts of a doorway generally do to each other. Nor is such difference of treatment—so fortunate in itself, inasmuch as it conduces to æsthetic variety—a merely arbitrary one, but is dictated by sound architectural propriety; for a Gothic window is not a mere gap in the wall, standing in need of external dressings to render it an ornamental feature; on the contrary it furnishes its own decoration, and the larger the window the more numerous the mullions and the more complex the tracery; consequently, all the more rich the design of the window. Another difference between Gothic doorways and windows is, that in the former the doors themselves are sometimes square-headed, the apertures being carried up only to the spring of the arch, in which case the tympanum, or space between the opening and the arch, is usually filled in with sculpture. A third difference between doors and windows—at least to doors in the Perpendicular style—is that for the doors the general design is formed into a square-headed composition and surrounded in its upper part by a series of external weather-

mouldings termed a label, and although labels are a very general, not to say universal, accompaniment to windows in the Tudor or Perpendicular Domestic style, they are almost unknown for large windows with a head formed by a single arch.

Newgate Prison.

George Dance, the younger, was not only trained up to architecture as a pursuit in which a safe and certain career, if not a brilliant one, was opened for him: he had applied himself to the study of it with a diligence exceeding what was required by the routine of that day, and he further possessed both a natural and cultivated taste for the fine arts generally, poetry included. He certainly stamped something of poetry as well as energetic character on the very first public work he executed; nor had he long to wait for the opportunity by which he signalled himself, for Newgate, that "proudest of prisons," was begun by him in 1770. This structure, one of the few truly monumental pieces of architecture in the Metropolis, has been chiefly extolled for its striking degree of character; yet it surely requires no very great ability to make an edifice of so peculiar a class express its purpose so clearly that it cannot possibly be mistaken for any other than what it is. Newgate might have been equally prisonlike in aspect had it been merely a dismal mass, utterly devoid of all æsthetic charm; it was by conferring upon it the latter—by breaking up the monotony of such a mass so as not at all to disturb unity, but enhance it—not to dissipate parts into littleness, but blend and condense them into one impressive whole—that Dance showed himself a great artist—let us say, a great tragic architect. The mode of treatment adopted by him might in less able hands have only weakened the expression aimed at, whereas here it renders it all the more energetic and the more intense. Truly felicitous is the manner in which, by being divided into boldly distinct and well-articulated parts, the composition acquires artistic play without losing anything of its severity. Truly felicitous also the effective relief both as to perspective and light and shade thrown into it, not according to the usual practice of bringing parts forward, but of recessing them, and placing masses in the rear of others, so that the general line of front is preserved unbroken in its lower part. The great drawback on this otherwise masterly composition is the centre compartment, or "governor's house." Well intended as is the kind of contrast between that part and the rest, the contrast actually produced is far from the happiest, the character given to the centre being somewhat prosaic and insignificant—by far too much like that of an ordinary dwelling-house, the windows being so many, in proportion to the space they occupy, as absolutely to crowd it and cut it up, to destroy breadth and repose, and to occasion an air of littleness; whereas, had there been only three windows on a floor, instead of five, the effect would have been incomparably better externally, and probably without the slightest inconvenience as regards internal plan. At all events the attic storey is a sad blemish, a most paltry termination to the centre of such a pile; but we believe we may vindicate Dance from the reproach of it, because not only does it look like an addition to the building, but really seems to have been an after and most unlucky alteration, since some prints of it represent the centre of the edifice crowned by a pediment, which gives variety to the whole composition without any sacrifice of dignity. If it was Dance himself who was afterwards complaisant enough to mar his own work, in order to provide an additional storey that might just as well have been concealed within the roof, very little is the pity we have to bestow upon him.

Ætïon the Greek Painter.

According to Lucian, Ætïon, Apelles, Euphranor and Polygnotus were the most successful of the ancient Greek painters in the mixing and laying on of colours. Ætïon's exact time is uncertain, although from the manner in which he is mentioned by Lucian, notwithstanding the names he is associated with, he lived probably in Lucian's own time, or at most very shortly before him. He speaks of him as the most distinguished painter of his time, and describes a very celebrated picture by him of the marriage of Alexander and Roxana, which the painter exhibited at the Olympic games, and which pleased Proxénidas, one of the judges, so much that he gave Ætïon his daughter in marriage. "It may be asked," says Lucian, "what was there so marvellous in that painting as should induce a man of such high rank to reward the painter, who withal was a stranger, by bestowing on him his daughter? The picture is still in Italy, and I am able to speak of it from personal inspection. It represents an extremely magnificent bedchamber with a nuptial bed. In it is seen sitting Roxana, the most beautiful virgin that can be conceived. Her eyes are modestly fixed on the ground before Alexander, standing near her. She is surrounded by several smiling Cupids. One of them behind her lifts up the bridal veil from her forehead and shows it to the bridegroom. Another, in the attitude of a slave, is officiously employed in drawing off her shoes, that she may no longer be detained from lying down. A third has hold of

Alexander's robe, pulling him with all his might towards Roxana. The king presents the maiden with a crown, and beside him stands Hephæstion as a bridegroom, holding a lighted torch in his hand, supported by a wonderfully fine youth, whom I guess to represent the god of marriage, for the name is not beneath. On the other side of the piece are drawn several more Cupids, playing with the arms of Alexander. Two of them carry his spear, and seem almost overburdened with the weight of it. Another couple take his buckler, with a figure like the king stretched upon it, trailing it along by the handles. Another creeps backwards into the coat of mail, where he seems to lurk in order to frighten the two little porters as they come on." "These collateral incidents," continues Lucian, "are by no means the mere wantonness and idle sport of the artist's fancy; they are to show the martial disposition of the bridegroom, and that his love for Roxana had not effaced his passion for arms and military glory." From this description Raphael is said to have made a design, of which there are duplicates or copies, and it was executed in fresco in the so-called Villa of Raphael, in the garden of the Villa Borghese at Rome; but the composition is puerile, and does not at all merit the praises which Lucian has given to the ancient performance of Ætïon. Lucian in the above description remarks that he guesses a fine youth to represent the god of marriage, as the name is not beneath. He alludes to an ancient custom which prevailed among the Greeks of attaching the names in their pictures to the figures represented; the names in most cases were probably written below the feet of the figure. In the pictures on vases we find the name sometimes written by the side of the picture, but the practice was not universal. In this case, from Lucian's remark it would seem that some of the figures had names attached to them, as he speaks of the other characters with certainty, and guesses only at the god of marriage, because there was no name attached. It was a practice, however, seldom if at all had recourse to in later times, and in case of its employment the name was probably so placed as not to disturb the pictorial effect. Sometimes sentences were inscribed on pictures, as, for instance, Zeuxis wrote upon his picture of Helen three lines from Homer, celebrating her extraordinary beauty. There are similar examples on works of the Middle Ages and also of much later times; inscriptions below allegories are very common. The circumstance that Pliny has not mentioned Ætïon is an additional reason for concluding that he lived about Lucian's own time, or in the early half of the second century of our era, subsequent to Pliny. Some, however, have supposed that the Echion of Pliny and Cicero is the Ætïon of Lucian, especially as the former was celebrated for a picture of a bride distinguished for the modesty of her expression; but this implies a great blunder in Lucian, who speaks of him as a painter of his own time, and there is no sufficient reason for such a supposition.

Roman and Greek Lineal Measurements.

The Roman foot has been determined in the following ways:—(1) By feet laid on sepulchral monuments; (2) by foot-rules obtained in the ruins of Rome and elsewhere; (3) by the distance of mile-stones; (4) by the distance of places; (5) by specimens of the congius; (6) by some obelisks; (7) by the dimensions of buildings. The method of ascertaining the foot by buildings is as follows:—Any remarkable length, such as that of the whole front of a building, being known nearly in Roman feet, is presumed to be exactly that number of feet which it must be nearly. This supposes that the Roman architects were in the habit of choosing exact numbers of feet when there was no particular reason for breaking a foot. Raper proceeds in the manner of which the following is an instance:—He finds the distances between the columns in the Temple of Fortuna Virilis to be 97106 English feet. If this be an exact number of Roman feet, it must be 10; we know enough beforehand of the Roman foot to say it cannot be 9 or 11. Consequently, if the distance between these columns be a whole number of feet, the foot must be 97106 of the English foot. By processes of this sort, Greaves found 131.50 lines, La Hire 131.0 and 132.4, La Condamine 130.9, Jacquier 131.08 and 131.14. Raper, who went more into this subject than the others, found by different buildings 131.14, 131.60, 131.62, 131.11, 131.16, 131.05, 131.16, 131.05 and 131.15 for the mean. Wurm, from the Vienna amphitheatre, adds 131.12. Raper thought he observed that the buildings subsequent to the time of Titus give a shorter foot than their predecessors. From instances he gets 130.75, 130.33, 130.34, with a mean of 130.34. He refers the change to the destruction of the Capitol (where the standards were kept) in the time of Vitellius. From all these data Raper's average, adopted by Wurm, is 131.15 French lines for the ancient foot, or 11.648 English inches, or 971 English feet. But Sir G. Shuckburgh made a careful review of the three best modes of obtaining the required result, namely, rules, buildings and tombs, and obtained .9672, .9681, .9696 of a foot English. The mean of these is .9683 feet, or 11.6196 inches. Again, if we take a mean of the results given by others, namely, Bernard .970, Picard

and Greaves '967, Folkes '966, Raper '970, we have also '9683. We take then the Roman foot at 11.62 English inches, which is represented far within the probable limits of error by the following:—61 English feet make 63 Roman feet. Eminent authorities of late years prefer 11.65 inches for the Roman foot, but we like to keep as near to the foot-rules as we can, consistently with giving due weight to other modes. Indeed, the question between 11.62 and 11.65 cannot be settled by authority, but must be decided by closer appreciation than has yet been made of the probabilities of the different methods. We have not now any means of knowing whether the fundamental points of connection between the Greek and Roman measures are exact or only approximate. These are, that the foot is longer than the Roman by one twenty-fourth, and the Philetærian foot by one-fifth, that the *μετροπυς* is an amphora and a half, and that the amphora of water or wine weighs an attic talent. Taking these relations for granted, we have for the Greek foot 12.10 English inches or 1.008 feet, for the Philetærian foot 13.94 inches, for the metretes 8.4879 gallons, and for the attic talent 56.586 lbs. avoirdupois. There is one stadium left at Athens which is 630 English feet, giving for the Greek foot 1.05 feet English, but there is not much dependence to be placed on the measure. Such buildings as have been examined at Athens, in the manner already described, given as a mean 136.69 Paris lines, or 12.14 English inches. We may, therefore, say that the Greek foot was longer than the English one by the tenth part of an inch. The statements then as to the relations between the Greek and Roman measures appear to have been tolerably exact, and our knowledge of the relations between our measures and theirs, though not sufficient for scientific comparison, is abundantly exact for the purposes of the classical student, far more so than could have been expected to have been attainable by those who remember that for a long period all means of comparison were lost.

Percier and Fontaine.

The names of Charles Percier and Pierre François Louis Fontaine are so intimately associated that the reputation of the one is inseparable from that of the other, for both their buildings and their publications were the productions of their joint talent. Percier, whose father was a colonel of dragoons, was born at Paris on August 22, 1764, and had for his first instructor in art Poirson, who was no more than a mere water-colour draughtsman. In 1783 he entered the school of Peyre, and afterwards studied under the elder Gisors, another architect of repute, and having obtained the prize for a project for a Jardin des Plantes in 1786, he went to Rome, where he was at first quite overwhelmed and perplexed by the multiplicity of buildings and other objects of art that all at once solicited his study. It was at Rome that his friendship and connection with Fontaine commenced, and there he also became acquainted with Flaxman, Canova and other artists who afterwards rose to eminence. During their residence in that city Percier and Fontaine made the drawings which form the subjects of their first publication, viz. "Palais, Maisons, et autres Edifices modernes, dessinés à Rome," Paris, 1798, a folio with 100 plates beautifully delineated and engraved in outline. In the interim, and for a while after their return, they had to contend with necessities and difficulties for a subsistence: the agitated state of public affairs was most unpropitious to their profession, more especially to beginners in it; they were therefore fain to provide for their actual subsistence by making designs for various articles of ornamental manufacture and furniture. The careful study and superior taste displayed by them rescued them from the obscurity to which they seemed doomed by bringing their talents in some degree before the public. Various decorations executed by them at Malmaison for the First Consul and Madame Bonaparte secured for them the powerful patronage of the Emperor Napoleon, and almost immediately after the commencement of his reign they were employed to restore, complete and embellish the two palaces of the Tuileries and the Louvre, of which latter more especially, the very extensive, numerous and complicated works fully occupied them for a series of years extending to some time after the restoration of the Bourbons. This accounts for their having, with all their high reputation, been employed on so few buildings, and flattering and favourable as it was it was not wholly without drawback, because they could not lay claim to those edifices as their own architectural creations, and their fame in them merged in the renown of their original authors. One distinct work of theirs is the arch in the Place du Carrousel, and such also are the ground staircase and other separate portions of the interior of the Louvre. The chief other monument by them is the Chapelle Expiatoire, erected after the Restoration in memory of Louis XVI. The line of houses called the Rue Rivoli adds little to their professional fame, it being no more than a handsome and regular piece of street architecture. For the general celebrity attached to their names Percier and his colleague are perhaps after all mainly indebted to their

publications, and not least of all to that entitled "Recueil de Décorations Intérieures, contenant tout ce qui a rapport à l'Ameublement," folio, Paris, 1812, a collection of designs for rooms and various articles of furniture in the ultra-classic style of embellishment that was affected in France at the beginning of the century, but which was so entirely matter of mere fashion that Percier lived to see it pass away. Another publication brought out by them about the same time was the "Choix des plus belles Maisons de Plaisance de Rome et ses Environs," a series not of strictly architectural studies, but pictorial views of Roman villas and their gardens. To these may be added two magnificent graphic works, one of them recording the ceremonies and pomps at Napoleon's coronation, the other those which took place on his marriage with Marie Louise. Besides these there is another work attributed to Percier, but which does not appear to have got into public circulation, "Parallèle entre plusieurs Résidences de Souverains de France, d'Allemagne, de Suède, de Russie, et d'Italie," Paris, 1833, with thirty-eight plates.

The Viking's Home.

In Iceland, in the tenth century, there were no towns in the Mediæval sense, nor perhaps in modern Iceland is there any aggregate of wood or stone which can, except by courtesy, be called a town. Such herding together has always been repugnant to the free disposition of the people; and when Iceland was a republic, one might as well have expected one hundred bulls to have been shut up together in a pound without using their horns, as to have seen the same number of heads of families living peaceably together, house touching house. In another sense there were towns; there were *túnir*, pronounced as the Scots pronounce their town, and by which they sometimes mean the same thing. Etymologically speaking, a town is an enclosed space—a field with a wall or fence round it. In such a town every Icelandic house stood; it was merely the field which surrounded the homestead, and which was immediately under the master's eye. As for the building itself, it was invariably of wood, with several gables—often as many as seven. Sometimes the farm-buildings (the *byre*, as they call it across the border) touched the main building; sometimes it was a separate erection, but it was always near. The Icelandic word for this was "*fjös*." The house itself seems rather to have grown together out of a number of houses than to be one house. The following at least were some of the main features of such a building. First there was a porch (*utihúrd*), an entrance in which there were double doors. This was in the centre, under the main gable, and led into a passage. On the left, as one went in, there was a bath-room, in which the inmates often took warm baths; their cold baths were the river or the sea. Out of the bath-house, on the left, was a door which led into the kitchen (*eldhús*), which sometimes had an entrance of its own from the town; out of the kitchen, still on the left, was the store-room (*skemma*). The whole house appears to have been what we call single, and each of these apartments ran its entire depth. Thus, then, on the left of the passage were what may be termed the offices. On the right of the passage was a door which led into a room which answered to the hall in an old English house; it was called the *skáli*, and was the state-room of the family. Here was the master's high seat, supported on either side by those pillars or columns of which one has heard so much. The seat itself was called *öudvegi* and the pillars *öudvegissúlur*. As a visitor entered by a side-door out of the passage and turned right about, this high seat faced him. Down the whole length of the hall ran a double row of tables and benches, at which the guests sat in order of honour, reckoned from their nearness to the master, and many an Icelandic brawl or feud arose out of quarrels for precedence on the festive occasions. Down the whole length of the hall, too, on such feasts, when the weather required it, were fires (*lángeldar*). Over the high seats, but sometimes, it would seem, at the other end of the hall, was a raised gallery or stage (*palli* or *thverpalli*), the special place for the women, who sat on it in solemn state on bridal feasts, occasions when all the formality and hospitality of the establishment were brought into full play. Sometimes there seems to have been a second high seat, lower and of smaller dimensions, opposite to that on which the master sat. In great establishments the *skáli* was hung with tapestry or woven hangings, the gift of kings or the spoil of piracy. Off the hall, on the right, was the sleeping-chamber (*svefuhús*), a spacious apartment in which let no delicate eyes be shocked to read that the whole family slept. Next to the sleeping-chamber, with its cribs, was sometimes added a smithy or workshop, where the handy master repaired his arms and his tools, forged spears and arrow-heads, fitted them to their shafts, and did a hundred things which are now handed over to the carpenter, the blacksmith, or the armourer, but which were then not thought below the dignity of the freeman. Thus, with its seven gates, over-storehouse, kitchen, bath-room, passage, hall, bedroom and workshop, the Icelandic house stands before one.

NOTES AND COMMENTS.

THE proposed Museum of Antiquities at Cairo, for which all the architects of the world can compete, is to have a frontage of about 600 feet. The site is approached by avenues, and will allow an open space of about 100 feet in front of the building. As the perfect condition of most of the Egyptian antiquities is in a great measure owing to the dry condition of the places where they were found, it is expected that means will be taken to prevent dampness throughout the building. For that reason the lower floor is to be raised from 6 feet to 10 feet above the level of the ground. As it is assumed that a weight of $28\frac{1}{2}$ lbs. per square inch, or 4,104 lbs. per square foot, will come upon the site, precautions must be taken to avoid settlements. The floors are to be fireproof, and constructed of steel or iron with cement, the upper surface being mosaic. The ground floor will be used for the exhibition of large and heavy works, which may be assumed to weigh 1,230 lbs. per square foot. Some courts will have to measure 40 feet wide, with a height of 30 feet, while others will be 19 feet wide and 20 feet high. On the second floor smaller objects will be exhibited, and the weight to be carried can be taken at 150 lbs. per square foot. It is expected that the ventilation will be effective, while dust is excluded. The first prize will be of the value of 620*l*. The designs are to be lodged in the Office of Public Works, Cairo, not later than March 1, 1895. All the premiated designs are to become the property of the Egyptian Government, and it is not guaranteed that any of them will be carried out. But if the author of the first design should be invited to take the direction of the works, the premium is to be merged in the commission.

It is a good stroke of policy to declare that the Paris Exhibition of 1900 cannot be a success unless there is an underground railway to convey the multitudes to the Champ de Mars. Sightseers usually prefer to travel by routes which are not subterranean, but six years hence they may have a preference for darkness. Hitherto all the efforts to start a metropolitan system in Paris have been fruitless; it remains to be seen whether the desire to attract strangers to Paris in 1900 cannot overcome the prejudices which, up to the present, have been invincible. M. LOUIS BARTHO, the French Minister of Public Works, will be able to make out a good case in favour of the project. He has spent a week examining the English and Scottish systems. Two days were devoted to the underground and electric railways of the Metropolis. At Liverpool he journeyed by the overhead line and through the Mersey Tunnel. He also investigated the Glasgow system. M. BARTHO can claim to be the first French Minister who adopted so efficacious a method of acquiring knowledge, and his travel's history will probably be convincing. The omnibus and voiture companies are, however, most influential in the French Chamber, and will not succumb without a struggle.

VIGOROUS efforts have been made during late years to make Glasgow a healthy city, but the statistics which were presented by the chairman of the Sanitary Congress last week reveal how much has yet to be overcome by philanthropists. Eighteen per cent. of the population continue to be doomed to dwell in one-roomed "houses." The average rent of these dwellings is 8*s*. a month, but some can be obtained for 5*s*. 6*d*. There are "farmers" who make a specialty of providing accommodation for the poorest classes. They take rooms at a rate of about 5*s*. a month, place a little furniture in them, and can let them for 4*s*. or 5*s*. a week. After all deductions are made the profit is at a higher rate than in most commercial enterprises. This mode of obtaining shelter is accepted as inevitable, and it is so well established, stringent measures will be required to deal with it. Mr. CRAWFORD considers that all houses which have not an area of 900 cubic feet should be closed, and that some check should be placed on their erection. Every house, he said, let for hire should be permanently guaranteed by the act of hiring as a house fit for healthy occupation, and it should be the business of the proprietor to regulate the behaviour of his tenants and the use of his property so that it could not become a source of danger to the public. The obstacle to an efficient mode of dealing with the difficulty in Glasgow and other cities is

the apprehension of the suffering which will be caused by its operation. What is to become of the miserable tenants if they are driven out of the wynds and alleys? In many cases it would be possible for the people to live in better rooms if they were less anxious to aid brewers and distillers in their efforts to gain peerages through wealth, but how are they to be convinced of that fact?

SCOTLAND has its Alpine clubs, and we suppose subjects for study and opportunities for climbing can be found by the members without the pains of crossing half of Europe. On Saturday the Innerleithen Club visited the Manor Valley and had the satisfaction of hearing Professor GEIKIE explain hills and valleys which are to be seen as well as those which had vanished. He also pointed out one of the costly failures which seem to be inevitable before the earth's surface can be profitably turned to account. Every geological professor begins a course by referring to them, and if the chance were given to him he would be sure to add to the list. The Manor Valley affords an example, for at Posso the Edinburgh Water Trust spent much time and money in vainly seeking for a foundation for the embankment which was to convert the upper valley into a huge reservoir to supply Edinburgh with water. The cause of the failure arose out of the great glaciers that had passed over the region. The roundness of the hills was evidence of the erosion, and there was an immense denudation. The whole of the valley bottom was consequently paved with boulder clay. That was the ground moraine laid down by the action of the ice. Possowood-hill, rising up in the middle, had been an obstacle to the progress of the glaciers, and there terrible erosion had taken place. The ice had scoured and ground to a great depth around the base of the hill before passing to each side of it, and it had left there an immense hollow and a vast amount of material in its retreat. That was why the engineers of the Water Trust had not got rock when they went to bore there. They were boring into a hollow that was ground out by the ice to a depth of about 350 feet. The ice had hollowed out the rock basin, just as a rushing stream hollowed out a basin in front of a rock that blocked its passage. After these moraines had been laid down there came more genial conditions, and the ice disappeared. Another period of cold followed, less severe, when the higher hills were covered with snow. This gave rise to smaller glaciers which came down the valleys, and as they melted there they dropped the *débris* they carried down, giving rise to terminal moraines. The Edinburgh Trust, we presume, were guided by the advice of geologists, but often it is not easy to determine the geological character of a place until a large region around is examined. When the Geological Survey is completed—if that day ever arrives, for there are continual changes in assigning districts to formations—misadventures like the one near Possowood-hill will become more rare.

THE condition of Heidelberg Castle is not likely to be forgotten by any visitor to the ruins. The injury which buildings suffer under the attacks of soldiers appears magnified there on account of the large number of statues which were deprived of heads and limbs during the siege. From the position of the building in a lovely landscape, the desolation seems to be intensified. It is true the structure has become a record of the lengths to which the Palatinate war was carried; but the crowds who visit Heidelberg would gladly trust to evidence of another sort. From time to time, therefore, projects for restoring the Schloss are announced. But the work would be very costly, and on that account it has not been commenced. A partial attempt is about to be tried. It is proposed to make an experiment with the sculpture. In the course of next month a commission of experts will meet to consider the subject. The members include such architects and building directors as Professors DURM, WARTH, KIRCHER, Herr SEITZ and Herr KOCH, the sculptors HEER, BINZ, WELTRING and others. They will have to determine whether the injured figures can be restored without any loss of character, or whether duplicates should not be executed and set up in the niches. Experiments will, of course, be made, and the recommendations of the commission will be subjected to the scrutiny of the numerous lovers of Heidelberg.

LONDON AND SOUTH-WESTERN BANK, HOLLOWAY.

THESE branch premises, here illustrated from the drawing which appeared at this year's Royal Academy Exhibition, are now in course of erection on a most commanding site at the junction of the Holloway and Parkhurst Roads, from the designs of Messrs. TRUEFITT & WATSON, architects, 5 Bloomsbury Square, W.C. White Mansfield stone has been used for the dressings to the main elevations. The ground floor is devoted to the banking business, and consists of a banking-chamber 30 feet square, with manager's-room, waiting-room, clerks'-room, &c., adjoining. The fittings throughout are in teak. The strong-rooms and lavatories occupy the basement, and are fitted with iron grilles and fireproof doors, &c., supplied by the Milner Company. The upper floors of the building are arranged for the manager's residence. The one-storey building facing the Parkhurst Road consists of a spacious board-room, with waiting-room, lavatories, store-place and manager's private entrance. The contractors for the whole work are Messrs. WILKINSON BROTHERS, of Finsbury Park.

THE CRUCIFIXION.

THE work which we illustrate forms the centre of three panels over the chancel arch of St. Martin's Church, Dorking, and is executed in Messrs. J. POWELL & SONS' "opus sectile," with mosaic background. The side panels, representing CHRIST bearing the Cross and the Entombment, yet remain to be done. The figures are over life-size. The artist is Mr. G. W. RHEAD.

THE NATIONAL PORTRAIT GALLERY.

IN last year's report the trustees of the National Portrait Gallery expressed a hope that the new gallery which is being erected at the cost of Mr. W. H. Alexander, or some portion of it, would be in working order by the following spring. These expectations, however, have not been realised. In explanation of the delay a letter was addressed to the Office of Works by Mr. Ewan Christian, the architect, dated March 16, 1894. He stated that after a consultation with Mr. Shillitoe he came to a conclusion that the whole of the main building could be properly finished in about nine months, and if required for preliminary use the south-east gallery could be handed over in one month, but if these rooms are not really wanted for use it would be preferable to wait a little longer. Mr. Christian had in a former report expressed his belief that the north building could be finished by the end of August, but the sudden and unexpected death of a principal assistant rendered a fresh calculation necessary. That caused some delay in the preparation of work which could not be safely hurried, and more time was therefore needed. Mr. Christian added:—"The work in the interior of the building has been progressing as fast as I think desirable; the windows have been purposely kept open during the whole winter with excellent results. With the exception of the principal staircase, which is not yet sufficiently dry, the plastering has been carried on in all storeys, and is now far advanced towards completion. All the boarding for the walls is in the galleries ready for fixing as soon as required, and the heating works are far advanced."

On June 14 of this year some of the trustees for the first time assembled within the walls of the new building. Mr. Christian explained the general architectural construction and disposition of the various apartments, and the uses designed for them on all the floors, together with arrangements for heating and ventilation. The trustees were impressed with the completeness with which every portion had been thought out, and the care with which all necessities had been provided for. The walls and flooring are fireproof, and the lighting in the principal galleries is excellent. Modern appliances and improvements have not been neglected, and wide staircases with lifts will facilitate both public and private access to all parts.

Although Mr. George Scharf, the director, has already devoted much of his time to considering the disposition and arrangement of the portraits on the new walls, and his plans are in a great measure matured, a considerable time must of necessity elapse between the reception of the portraits from Bethnal Green and other places of temporary deposit, and the thorough completion of the gallery for the admission of the public.

During the past year the collection received the following additions:—A copy of Woolner's bust of Tennyson, which was sculptured from life in 1857; a chalk drawing by Samuel Laurence of the late Earl of Derby; a bust by John Gibson, R.A., of Sir Charles Lock Eastlake, P.R.A.; a portrait of Lady Callcott, by Sir T. Lawrence, "the work of two hours, during the whole of which time Sir Charles Eastlake was present;" a medallion in plaster of the fifth Earl Stanhope, the first chairman of the board of trustees of the National Portrait Gallery; a water-colour half-length portrait of Henry Hunt, the reformer and orator; a second portrait, full length; a portrait of William Roscoe, the historian; a portrait of William of Nassau, the father of William III.; a portrait of Frederick of Bohemia, the son-in-law of James I., and grandfather of George I.; a portrait of Sir Peter Lely, painted by himself; a portrait on panel, by J. M. Wright, of Elizabeth Claypole, the second and favourite daughter of Oliver Cromwell; a portrait on mahogany of John Martin, the painter; an unfinished portrait of George Romney, the painter, by himself; a life-size portrait of Lord Chancellor Erskine, by Sir William Ross; a portrait of the first Lord Paget; and a portrait by Paul von Somer, of Sir Henry Spelman, the antiquary.

THE LATE HENRY FAIJA.

WE regret to announce the death on Tuesday, the 21st inst., of Mr. Henry Faija, M.Inst.C.E. He was the son of Mr. G. Faija, a popular artist and miniature painter to the Queen. He was born at Alfred Place, Bedford Square, W.C., in 1844, and educated at University College School. He was articled to the firm of Westwood, Baillie, Campbell & Co., shipbuilders, of the Isle of Dogs, E., but the firm failed before he had completed his articles. He then went north, and occupied important positions, first with Messrs. Hopper, of Hull, and afterwards with a firm of shipbuilders on the Tyne. After a brief partnership with a firm of engineers at Stoke-on-Trent, he came to London about 1870, and started practice as an engineer in John Street, Bedford Row. On obtaining a commission to design and erect some cement works, the rough-and-ready methods then in vogue impressed him with the vast field for improvement in that branch of industry, both from an engineering and scientific point of view. From that time he made a specialty of cement works, and thus commenced his career as an expert in all matters relating to cement and cement-making materials. He since designed and erected works for the production of cement in various parts of England and abroad, including Brazil and the United States, and also received applications to personally undertake work in South America and other places abroad, which his professional engagements in England prevented him from accepting.

About 1880 he removed to 4 Great Queen Street, Westminster, and there established a cement-testing room and chemical laboratory, where cement and cement-producing materials were examined and reported upon. The steady growth of this branch of his practice was an indication of how much his opinion was valued, and in 1888 he found it necessary to remove to larger premises.

Mr. Faija was a member of the principal engineering and learned societies, viz. the Institution of Civil Engineers, Institution of Mechanical Engineers (1869-89), British Association, Royal Institute of British Architects (honorary associate), Society of Arts and Society of Engineers, of which latter body he was vice-president at the time of his death, and but for his untimely removal would have succeeded to the chair in due course. He at various times contributed papers to the above societies on the subject of which he had made a special study, and was awarded premiums by the Society of Engineers for papers read before that body in 1888 and 1889. The latter papers were prepared with the object of combating the "magnesia" scare which occurred at that time owing to the Aberdeen failures, and conclusively proved that the supposed destructive effect of sea water on a properly manipulated cement concrete was a scare and nothing more. In 1881 he wrote a treatise entitled "Portland Cement for Users," which has since run through more than one edition, and is now included in Weale's series of scientific handbooks, and he was a frequent contributor to the leading professional papers. During a long experience Mr. Faija accumulated a vast amount of precise scientific data, based upon careful experiments with cements and cement-producing materials from all parts of the world. These experiments and tests have been made with instruments chiefly of his own invention, and the recorded results far exceed those of any other investigator in the same field of inquiry. Mr. Faija was specially invited by the American Society of Civil Engineers to communicate a paper on the subject at Chicago last year. The work of his office and laboratory has for some time past been carried out by Mr. Butler, who for many years has worked with Mr. Faija as his chief assistant, and who, by his express desire, will continue to carry on the business for the benefit of the family.

THE TRUE PRINCIPLES OF POINTED OR CHRISTIAN ARCHITECTURE.

By A. WELBY PUGIN.

(Concluded from page 125.)

I MUST here mention two great defects very common in modern Pointed buildings, both of which arise from the great fundamental principle of decorating utility not being understood. In the first place, many architects apply the details and minor features of the Pointed style to Classic masses and arrangements; they adhere scrupulously to the regularity and symmetry of the latter, while they attempt to disguise it by the mouldings and accessories of the former. They must have two of everything, one on each side; no matter if all the required accommodation is contained in one half of the design, a shell of another half must be built to keep up uniformity. What can be more absurd? Because a man has a real door to enter his house by on one side, he must have a mock one through which he cannot get in on the other. How inconsistent is it to make and glaze a window which is to be walled up *ab initio*. But to see the full absurdity of this system, let us only imagine the builders of the ancient colleges, after having finished a church and refectory on one side of a quadrangle, running up something to repeat them by way of a pendant on the other, so as to appear two churches and two dining-halls to one college. In the second place, when modern architects avoid this defect of regularity, they frequently fall into one equally great with regard to irregularity; I mean when a building is designed to be picturesque, by sticking as many ins and outs, ups and downs about it as possible. The picturesque effect of the ancient buildings results from the ingenious methods by which the old builders overcame local and constructive difficulties. An edifice which is arranged with the principal view of looking picturesque is sure to resemble an artificial waterfall or a made-up rock, which are generally so unnaturally natural as to appear ridiculous.

An architect should exhibit his skill by turning the difficulties which occur in raising an elevation from a convenient plan into so many picturesque beauties, and this constitutes the great difference between the principles of Classic and Pointed domestic architecture. In the former he would be compelled to devise expedients to conceal these irregularities, in the latter he has only to beautify them. But I am quite assured that all the irregularities that are so beautiful in ancient architecture are the result of certain necessary difficulties and were never purposely designed; for to make a building inconvenient for the sake of obtaining irregularity would be scarcely less ridiculous than preparing working drawings for a new ruin. But all these inconsistencies have arisen from this great error—the plans of buildings are designed to suit the elevation, instead of the elevation being made subservient to the plan.

Under the head of architectural propriety we have also to consider the scale and proportions of buildings. Without vast-

ness of dimensions it is impossible to produce a grand and imposing effect in architecture; still, unless these be regulated on true principles, they may destroy their effect by their very size; and here I wish to draw your attention to a point which will prove the great superiority of the Christian architecture of the Middle Ages over that of classic antiquity, or of the revived pagan style. In Pointed architecture the different details of the edifice are multiplied with the increased scale of the building; in Classic architecture they are only magnified.

To explain this more fully, if the Pointed architects had a buttress and pinnacle to erect against some vast structure, such as the cathedral of Cologne or Amiens, they did not merely increase its dimensions by gigantic water-tables, enormous crockets and a ponderous finial; no, they subdivided it into a cluster of

piers and pinnacles—they panelled the front, enriched it by subordinate divisions, and by these means the pinnacles of Cologne appear five times as large as those of an ordinary church,* which could never have been the case had

they only enlarged the scale instead of multiplying the parts. But the very reverse of this is the case in Classic architecture; a column or cornice is the same, great or small, whether they are employed in front of an ordinary house or of a vast temple. No distinction except that of size is ever made; there are the same number of diameters, the same number of mouldings, the same relative projections. It is merely a magnifying power applied to architecture. What is the result? Till you actually stand under these buildings, and find that your chin does not come up to the plinth at the base, you do not perceive the scale. This is perfectly exemplified at St. Peter's. The effect on all who first enter it is that of disappointment; it does not appear anything like so large as they anticipated. Some of its admirers have tried to pass this off as a great beauty, and have attributed it to its beautiful proportion. This reasoning will not, however, stand the test of close examination; it is essentially false. One of the great arts of architecture is to render a building more vast and lofty in appearance than it is in reality. The contrary effect produced by St. Peter's is not the least among its many defects, and it is purely owing to the magnifying instead of the multiplying principle having been followed. The great size of its various parts and mouldings required the introduction of colossal figures, which are certain to reduce the appearance of size in any buildings where they are used.

The human figure is a general standard for scale. We are accustomed to assimilate the idea of about five feet nine inches with the height of a man. Hence, be a drawing ever so small, by inserting a diminutive human figure it will immediately convey an idea of the intended size, and on the contrary, if the figures in a drawing be over large, the apparent space represented is immediately reduced in appearance. So is it in architecture: a figure of 18 feet high will reduce 100 feet to less than 40 in appearance, and the mystery of the disappointing effect of scale in St. Peter's is satisfactorily accounted for. It is all very well for guides and *valets de place* to astonish travellers by stating that three persons may sit on the great toe of a statue, or that if a figure were laid on its back five men might straddle across the nose. So much the worse for the effect of the building where such a figure is placed.

In Pointed architecture we seldom find any images larger than the human size, and generally much less. Hence the surprising effect of height and scale conveyed by many old Catholic buildings, which are not in reality half the size of some of their more modern and semi-pagan rivals at Rome.

In general our English churches are deficient in internal height; not that our national style of Christian art does not possess some fine specimens of this important feature, as in the glorious church of St. Peter, Westminster; but I think the internal vastness of Amiens, Beauvais, Chartres and others of the French churches, should serve as useful examples to us in this respect in the revival of Pointed and Christian architecture in England. Nothing can be conceived more majestic than those successions of arches divided by light and elegant clusters of shafts running up to an amazing height, and then branching over into beautiful intersected ribs, suspending a canopy of stone at the enormous height of not unfrequently 150 feet. Internal altitude is a feature which would add greatly to the effect of many of our fine English churches, and I shall ever advocate its introduction, as it is a characteristic of foreign Pointed architecture of which we can avail ourselves without violating the principles of our own peculiar style of English Christian architecture, from which I would not depart in this country on any account. I once stood on the very edge of a precipice in this respect, from which I was rescued by the advice and arguments of my respected and reverend friend Dr. Rock, to whose learned researches and observations on Christian antiquities I am highly indebted, and to whom I feel it a bounden duty to make this public acknowledgment of the great benefit I have received from his advice. Captivated by the beauties of foreign Pointed architecture, I was on the verge of departing from the severity of our English style and engrafting portions of foreign detail and arrangement. This I feel convinced would have been a failure; for although the great principles of Christian architecture were everywhere the same, each country had some peculiar manner of developing them, and we should continue working in the same parallel lines, all contributing to the grand whole of Catholic art, but by the very variety increasing its beauties and its interest.

In conclusion, Christian verity compels me to acknowledge that there are hardly any defects which I have pointed out to you in the course of this lecture which could not with propriety

* A pillar in Classic architecture is a mere cylinder, of large or small diameter. In the Pointed style a pillar is subdivided into shafts, which increase in number with its size, and form beautiful clusters.

be illustrated by my own productions at some period of my professional career. Truth is only gradually developed in the mind, and is the result of long experience and deep investigation. Having, as I conceive, discovered the true principles of Pointed architecture, I am anxious to explain to others the errors and misconceptions into which I have fallen, that they, profiting by my experience, may henceforward strive to revive the glorious works of Christian art in all the ancient and consistent principles. Let then the beautiful and the true be our watchword for future exertions in the overthrow of modern paltry taste and paganism, and the revival of Catholic art and dignity.

WADDESDON MANOR AND EYTHROPE.*

WHEN I suggested having the annual meeting of our Society at Waddesdon I was asked on more than one occasion what there was there I could point out worthy the attention of an antiquary. I venture to assert that besides the priceless collection of old china and pictures we shall see to-day there is no point of Buckinghamshire, I might say of England, more replete with matters of interest to the antiquarian or student of history than the lovely tract of country which forms the estate round this house. We have only to look from the windows on the magnificent panorama that lies before us to see what I mean. From the earliest times this rich tract of country lying in the centre of England has been a battle-ground. Such names as Denham at Quainton, or the Dane's Ham, Horsendon, or the Mound of Horsa, remind us of the Danish occupation of these parts; Ashendon, close by, which Kennet held to be the site of the great battle between King Alfred and the Danes; Bledlow Ridge, close by, has an ominous sound of blood; and the Gravenshill, near Bicester, might have been the place of the graves of the victims of this great and bloody contest, which probably spread over the flat lands which lie immediately below the hill. In front of us we see the great White Cross telling of some Christian victory over the pagan—possibly cut in memory of the battle of Ashendon. I am aware that there is another district that claims this great battle, but I do not see myself why Kennet may not be right in stating this to have been the place where it was fought. As you look beyond Ashendon on the right on a clear day can be seen the heights of Edgehill, where the first great battle between the Royalists and Cromwell's army took place, where the Squire of Winchendon was present with so many other leading Buckinghamshire squires and their tenants, leaving their hay-carts and cattle in the rich vale and quiet homes to join in the terrible Civil War. In the same direction, as the crow flies, some four miles distant, rises Brill Hill. In early times there was a royal palace there, where the kings, among whom was King John, used occasionally to reside for the sport afforded by the wild boars which the forest of Bernwood, at its base, contained in such abundance. Edward the Confessor was born a few miles further on, at Islip, and made a grant of Boarstall, below Brill, to Nigel for killing a boar of a most savage character, which we may infer was a particular terror to the dreamy monarch. I remember the horn granted on this occasion used to be in the possession of the Aubrey family at Dorton. I hope it is there now.

* From a paper by the Rev. R. H. Pigott, read at a visit of the Bucks Archaeological Society to Waddesdon Manor, the residence of Baron Ferdinand de Rothschild, M.P.

This district played an important part during the Civil War. King Charles held his Parliament and headquarters at Oxford, which you are unable to see from the block caused by the ridges of Ashendon and Brill. Prince Rupert held Brill here with his dashing cavalry, whilst Cromwell entrenched himself at Claydon and Aylesbury. Chalgrove field, which must be almost in sight, was where Hampden fought and died. At Eythrope there was a battle, and in the Verney Memoirs we read how a certain Captain Abercrombie was killed who, a short time before, was one of the officers who surrounded the old house of the loyal Dentons at Hillesden. During the siege he fell in love with one of the ladies of the house he was besieging, and having been married a few weeks was killed close to this house. This little romance speaks eloquently of the horrors of civil wars; the man who had given his heart to the lady, and yet was compelled by the stern exigencies of the time to burn down his future brother-in-law's house.

Immediately in front of us rises the chalk range known as the Chiltern Hills—so dangerous in old times that a steward had to be appointed to protect travellers, which now sinecure office a member has to accept in order to vacate his seat in Parliament. The road which we have passed along this morning is the old Roman road, which passes under the Gravenshill I have alluded to, to where was the Roman city Alcester; where the entrenchments round the old forum are still visible. This road is called the Akeman Street, and is said to have derived its name from the aching men who used to pass along it for relief to the Aquæ Solis of Bath, which before the Roman occupation was celebrated for the curative qualities of its waters. I might add that the late Lord Beaconsfield, who I can remember so well when he first bought Hughenden, used to delight to drive his friends over the Chiltern Hills and tell them how the Great Rebellion, to use his own words, was hatched there. I am sure I have now said enough to make you feel how full of interest the prospect from this house must be to every intelligent Englishman and student of the history of the past.

I am now going to tell you a little about the two places we are about to visit. I claim, of course, to tell you nothing that is original, and should at once tell you that the sources I have derived my information from are chiefly Lipscomb's "County History," Bishop Kennet's "Parochial Antiquities" and Gibbs's "Buckinghamshire Worthies." The mention of this last book reminds us of the loss our Society has sustained by the death of the most accurate and diligent antiquarian, one of our late secretaries. Then there is Macaulay's "History of England" and Lysons's "Bucks," from all of which I have been able to gain information. The associations of Winchendon and Eythrope are full of interest, having contained the houses of some of the most remarkable men that have ever played their parts in the history of this county, and I may even add of this country. It is impossible to do more than give a very slight sketch of some of these singular men who lived here, and I shall keep myself as much as possible to that which has a local interest to us, as Buckinghamshire men.

The property of Winchendon came into the family of Wharton through a marriage with the Goodwins. Thomas, first Lord Wharton, was buried at Kirkby Stephen. The Westmorland monument is a remarkable one, representing the knight resting between his two wives; his head rests on a helmet of a bull's hide. The folds of the helmet were imagined by the poor people to represent Satan, whom he had vanquished, and the long Latin inscription Lipscomb records was profanely parodied in these lines:—

Here I, Thomas Wharton do lie,
With Lucifer under my head;
And Nelly, my wife, hard by,
And Nancy as cold as lead.
Oh! how can I speak without dread,
Who could my sad fortune abide,
With one devil under my head,
And another close laid by my side?

Philip Lord Wharton, like so many of the Buckinghamshire squires, took a very leading part in the Civil Wars. We find him sent up at the request of the Lord General, the Earl of Essex, as the representative of the troops to make a report of the battle of Edgehill to the City of London.

This Lord Wharton, who lived at Winchendon House, was a man of great taste. He had the finest collection of Vandyke's and Sir Peter Lely's pictures in England and laid out vast sums of money to appear in suitable magnificence at the landing of Charles II. In his latter days he became a Calvinist, it would seem, from what Macaulay says of him. There is a lonely little dissenting chapel just behind the site of the old mansion. It is far from any house or village and was no doubt built by Lord Wharton for the exposition of his Calvinistic doctrines. He left money to be used in the purchasing 1,650 bibles, with singing psalms bound up in them. These bibles were to be distributed in various villages, and the recipients in the October following were to be examined as to their general knowledge of the catechism, and if they knew it were to

receive a book called "A Sure Way to Heaven," by Joseph Alleyne, and "The Principles of the Christian Religion," by Thomas Lye, A.M. I wonder if the books are given now in other villages (as I am informed they are given in Waddesdon), and how many children care to qualify themselves to receive the works of the time-forgotten, but no doubt excellent divines, Joseph Alleyne and Thomas Lye, A.M. I might add that it is expressly ordered in the deed that the bibles should be bound in calves' leather and the catechisms in sheep's leather. I have no doubt by this quaint order Lord Wharton thought he was benefiting not only the souls of the children but also assisting the agricultural interest. About this time it was ordered that everyone should be buried in lamb's wool, and entries to this effect will be found in the register. This was also with the same laudable object as Lord Wharton's bindings of calves' and sheep's leather. I might add before Winchendon Church was restored I was, some years back, on visiting it much interested in seeing that the holy table was removed from the wall and surrounded by seats. This, no doubt, was the work of the Calvinistic lord, who introduced the custom at that time in vogue at Geneva by sitting round the table as at an ordinary meal.

But I must now pass on to his son Thomas. He was made a marquis, and was the most popular lord-lieutenant of Ireland that ever existed. He was created Viscount Winchendon, Marquis Wharton, Lord Lieutenant of Oxon, Westmorland and Bucks, and held the office of Lord Privy Seal. I cannot help thinking Macaulay was rather unjust in his most bitter summary of Lord Wharton's character, and in all probability mixed his life and deeds up with that of his son, Philip Dale of Wharton, whose life seems to have been as dissolute as it was romantic. Lord Macaulay refers to the election successes of Lord Wharton.

Such a master of the art of electioneering England had never seen. Buckinghamshire was his own especial province, and he ruled without a rival. But he extended his care over Whig interests in Yorkshire, Cumberland, Westmorland and Wiltshire. Sometimes twenty, sometimes thirty members of Parliament were named by him. He made himself so popular that his journeys to the Buckinghamshire Quarter Sessions resembled royal progresses. The bells of every parish through which he passed were rung, and flowers were strewed along the road. It was commonly believed, in the course of his life he expended on his Parliamentary interests a sum equivalent to 300,000*l.* of our money at the present time. He was quite as dexterous a canvasser among the embroidered coats at the St. James's Coffee House as among the leathern aprons at Wycombe and Aylesbury. Wharton's political adversaries thirsted for his blood, and repeatedly tried to shed it. Had he not been a man of imperturbable temper, dauntless courage and consummate skill in fence, his life would have been a short one. But neither anger nor danger ever deprived him of his presence of mind. He was an incomparable swordsman, and he had a peculiar way of disarming opponents which moved the envy of all duellists of his time. His friend said that "he had never given a challenge, that he had never refused one, that he had never taken a life, and yet that he had never fought without having his antagonist's life at his mercy." In another passage Macaulay describes Wharton and his friends, "the great Whig power of the day, staying at Winchendon for the races," which he says was near there. This old racecourse was at Quainton, I imagine in the flat piece of land near the station, which of course in those days was unenclosed. I remember an old man telling me that in old days it was not unfrequently the case on foggy days for the traveller to be lost on this dreary piece of flat, and that the church bells used to be rung occasionally as a guide to extricate the wanderer from Slack, as it was originally called. This no doubt was the Quainton racecourse, where not only Wharton and his friends used to run their horses, but also where, I think, I have heard that Charles II. had been present on a certain race day. The party, Lord Macaulay remarks, to whose interest Wharton, with such spirit and constancy, devoted his time, his fortune, his talents, his very vices, judged him as was natural far too leniently. He was widely known by the very undeserved name of Honest Tom. Some pious men, Burnet, for example, and Addison, averted their eyes from the scandal which he gave, and spoke of him, not indeed with esteem, yet with good-will. The opinion of the Tories, on the other hand, of him is expressed in a single line, written after his death by Dean Swift, the ablest man of his party, "He was the most universal villain that ever I knew." Lord Wharton died in 1715, and was buried in Upper Winchendon Church, that we shall visit this afternoon.

He was succeeded by his son Philip, who is commonly known as the Duke of Wharton. This Philip was a man of such extraordinary talent that the king soon advanced him to the highest rank of the peerage. In spite, however, of this signal mark of honour we find him shortly after making friends with the Pretender, from whom he accepts the title of the Duke of Northumberland, and is made a Knight of the Garter. He

then becomes a bankrupt and actually joins the army of the Pretender. He afterwards enters the army of the King of Spain, and was present at the Siege of Gibraltar. For this he was indicted for high treason, and his estates confiscated. He is said afterwards to have become a monk, and to have died in the convent of the Charitable Monks of Tarragona. At the death of this most brilliant but profligate man ends the race of the Whartons of Winchendon, and now just a few words about what remains of the house of this most remarkable and interesting family.

The house was said to have had the finest garden in England, but one disadvantage to the house and garden must have been the northern aspect. In "Magna Britannica" it is recorded that the house was celebrated for a fine collection of orange-trees. The garden was formed in the style introduced by the Prince of Orange. The terrace walks may still be traced. Lipscomb records in his time that only a small portion of the north-western angle of the inferior edifices were standing, in which the apartments contained old wainscot. There were pieces of a large gateway and an arch on the west side communicating with the courtyard, also a large and magnificently-designed stable. This magnificent stable, formerly the home of Wharton's gelding, had heavy carved pillars, cornices, mangers and racks, and a stuccoed ceiling partly gilt, indicative of the splendour of its ancient possessors. After the estate came into the possession of Charles Duke of Marlborough, the house was taken down, and John Russel, of Aylesbury, purchased all the material of the building, with the iron gates, palisades and stone images in and about the gardens, for the price of 1,400*l.*, to be paid by instalments. In the Grove or Wilderness, as it was called, on the eastern verge of the gardens, is a small building, which Lipscomb says was built for the residence of a favourite lady; who this lady was we are not informed. It would be most interesting to know what had become of the fine old woodwork and other ornamental materials of this old house, which if the house was as highly finished as the stables described in our county history, must have been of the most elaborate description. In the rectories of Quainton and Grendon, and in the drawing-room of Winchendon Priory close by, there is some fine panelling, all of the same date; possibly this panelling was moved from the house when pulled down. The old family pictures seem to have found their way into houses in the neighbourhood, and Lipscomb seems to have been able to identify some of them; but it is sad that two such interesting houses as the Duke of Wharton's and the Earl of Chesterfield's, both standing in the grounds of our host and his sister, should so entirely have been obliterated, not even a print being left of either of them.

On our way to Eythrope we shall pass a rusticated building which, like that on the brow of the hill behind Dinton, I am informed by Colonel Goodall was built by his ancestors and Lord Chesterfield, not only as an ornamental object in the view, but as a place where the families at Dinton and Eythrope used to meet each other. It is impossible for me to give any account of the Chesterfield family, as my paper has already exceeded the length I had intended. The letters of Lord Chesterfield to his son are English classics. Before the Chesterfields the Dynhams lived at Eythrope. Sir John in the reign of Henry VI. assisted at the relief of Calais; his son was knighted, and became a patron of the House of York. Edward VI. summoned him to Parliament amongst the barons, and made him a Knight of the Garter. The chapel of Eythrope was founded in pursuance of the will of Roger Dynham, 1490. He bequeathed his body to be buried in Waddesdon Church till his chapel should be ready. The chapel was built, and we are told was 42 feet long and 15 feet wide, and wainscotted with oak. Willis tells us in his time there was an old sepulchral monument of grey marble, with brass plates and effigies of a man in armour. This, no doubt, was the monument of the good old knight, Sir Roger Dynham, which was discovered lately.

And now I have a story as remarkable as any ghost story ever told. Browne Willis tells us, with much disgust, how Sir William Stanhope had, by desire of his wife, built up the chapel, and caused Divine service to be celebrated in it regularly for ten years, yet at length in 1738 he most wickedly and sacrilegiously and impiously demolished it. He says he made use of the stones to build a bridge over the Thames. He adds, the tombstone of the founder was taken up and the grave opened in the hope of finding a treasure. On your way back to Aylesbury you will pass over this bridge formed from Sir Roger's old chantry, and will notice the peculiar construction of the arch, which was no doubt caused by having to use stones instead of bricks. But to continue my story, after a time the house of the Chesterfields followed the fate of the chantry. It must have been as interesting and much more ancient than the Winchendon mansion. Sir Roger is pronounced to have resided there in the reign of Edward VI. His son Sir William built a spacious apartment with a covered roof of timber, with angel corbels bearing coats of arms. Later on Dame Dorothy

built a suite of rooms to which the date 1610 was attached at the time of the demolition of the house. In the house was a gallery 133 feet long, and a collection of pictures, which were afterwards sold by auction. In time this fine old mansion shared the fate of so many interesting houses in this district. It was entirely demolished, and not one single stone was left to tell where stood the chantry of Sir Roger Dynham or the stately home of the Earls of Chesterfield. Some years ago Miss Rothschild laid out the beautiful gardens we shall visit on our way back to Aylesbury. On the site of the old mansion and chantry a night watcher had to keep guard over these lonely gardens at night, and particularly objected to go to one spot during his nocturnal vigils, asserting this particular spot was haunted. Notice, I understand, had also been taken that in this particular place there was a spot where grass refused to grow, and that when all round was verdant this place remained brown and dried. It was determined to remove the earth here, and on doing so within 6 inches of the surface they discovered, in a broken-in lead coffin, the remains of the good old knight, Sir Roger Dynham. In the coffin were the bones and teeth of the founder of the desecrated chapel and a rusty spur. There could be no doubt whose remains they were, for with the coffin was a monumental stone, with brass plates and the effigy of a man in armour, supported by pillars, with four shields of arms. These were the same arms and inscriptions as recorded by the old antiquary Willis. On the three arches of the canopy still remain the words, "Mercy, Christ, Grace." Around the verge is a long Latin inscription. After a rest in the green fields of Eythrope of over 500 years, the bones of the old knight, Sir Roger Dynham, again rest in consecrated ground. The remains were removed at the direction of Miss Rothschild to Waddesdon churchyard, under the shadow of the porch.

I have told you this story as told me by the rector of Waddesdon, and I can conceive no story more remarkable. That 400 years ago a man should be buried in Waddesdon Church and then be removed to his chantry, that the religion of his country should change and no chantry priest be allowed to pray for his soul supported by the money he left was no doubt enough to make the spirit of the brave old knight uneasy. But that a successor at Eythrope should have actually desecrated this beautiful old chantry and made a bridge over the Thames with the stones he had hoped to cover his remains must have been horrible; but that this successor should have actually broken open his coffin in search of treasures, and have taken one of his spurs (for one was taken), was certainly enough to cause his disturbed spirit to wander over the spot. I can in conclusion say I thoroughly sympathise with the ghost of Sir Roger Dynham. I think it indeed sad that the indifference of the last century should have allowed the desecration of such interesting old churches as Eythrope, Quarrendon and Hogshaw in our immediate neighbourhood, and that the lack of taste and veneration for antiquity, such as our Society endeavours to foster, should have allowed such grand old houses as Winchendon and Eythrope, with their magnificent gardens, carved panelling and windows full of fine painted glass carrying the shields of arms of the old possessors, to have been utterly destroyed. In the name of the Bucks Archaeological Society I tender to the ghost of Sir Roger our sincere sympathy, and sincerely trust that the visit of the Society to his resting-place of 400 years may be taken as a token of our respect, and that in future no night-watcher at Eythrope may be frightened by this troubled and indignant spirit.

Baron Rothschild said there was a small building at Winchendon in which the agent of his estate resided. That building formed part of the offices of the ancient manor that had been alluded to, and was at the present time panelled with the ancient panelling used in the olden times. It was also occupied in the same manner now as it was some centuries ago, namely, by the bailiff of the estate or one of the upper servants.

THE CARLISLE INFIRMARY.

A MEETING of the health committee of the Carlisle Urban Sanitary Authority has been held to consider the subject of the new infirmary buildings.

Mr. Howitt, secretary of the infirmary committee, appeared before the committee to show cause why the new nurses' wing just added to the Cumberland Infirmary should not be pulled down in consequence of a breach of the by-laws. The alleged breach of the by-laws was that the buildings had been put up without having had the plans passed by the Urban Authority. Mr. Howitt, says the *Carlisle Journal*, read a memorandum which had been drawn up by the infirmary committee on the subject. It entered into a number of details. In the first place they repudiated the notion that they had any wish to act in contravention of the by-laws, and said they had trusted to their architect and builder to carry out the formalities and to give all necessary notices. They were made aware on January 18, 1893, that the city surveyor had declined to approve

the plans first submitted because (1) in certain cases it was proposed to use 4-inch drains, and (2) the partitions between the bedrooms were cross walls, and as such were not 9 inches in thickness. Their architect, Mr. Ferguson, appeared before them on January 25, 1893, and stated that the 4-inch diameter of branch drain had been passed, but that the plans had been rejected on the question of the cross walls, which, however, would be rectified. A minute to that effect was entered in the books of the infirmary committee. That committee were informed by Mr. Ferguson that all notices required by the by-laws had been duly served, and if the by-laws had been infringed in any instance, however small, the committee expressed their regret and ventured to hope that the health committee would see their way to approve the plans which had been used, if not already approved.

The Town Clerk said that when Mr. Ferguson first sent in plans four objections were raised and discussed, and letters were written, some of which were sent by Mr. Ferguson to the newspapers. The plans were not approved, but the committee agreed that upon certain alterations being made and plans again submitted an arrangement might be come to. No fresh plans meeting the objections were sent in, and therefore no plans had ever been approved. They had Mr. Ferguson's own testimony in the words quoted at last meeting about the "strong infirmary committee," in which Mr. Ferguson said that no notice was taken of certain objections which he described as illegal, there being a strong infirmary committee, and that later on, on the advice of the Town Clerk, the objections were withdrawn.

It appeared from the discussion which followed that the plans originally sent in had been disapproved, and that in a subsequent discussion the committee indicated the lines on which fresh plans ought to be drawn to meet their objections. Fresh plans were never submitted, and the by-laws had therefore been broken. The committee now stated that they would be willing to consider fresh plans if sent in, showing how the new Nurses' Home had been built, and the matter was left there.

KIRKSTALL ABBEY.

THE work of preserving the historic abbey ruins at Kirkstall is, according to the *Leeds Mercury*, progressing but slowly. It is a difficult task, and one not altogether free from danger. Three years have elapsed since the masons first commenced their labours, and for another twelve months at least they will be busily engaged. The expenditure by the Corporation upon the abbey and grounds amounts already to about 5,500*l*. The repairing of the vaulting of the chancel and the strengthening of the tower is now engaging the attention of Mr. Micklethwaite, the architect. In 1779 the north-west pier and the north and west arches were utterly destroyed by the fall of two sides of the tower. What is left of the tower had, up to recently, nothing to support it on the north side, and an unusually violent gale might at any time have brought it down. Even now the masonry of the upper part of the tower is in a very crumbling and unstable condition. The chancel is at present filled with a network of scaffolding poles. The greatest possible care has to be exercised in fixing this scaffolding, the slightest touch in certain parts of the ruins being sufficient to detach large pieces of masonry. The western portion of the church has been secured for posterity. In an especially good state of preservation is the west entrance, where very little new work has been required. With the north transept, on the other hand, it has been found necessary to rebuild a considerable portion. After the preservation of the abbey itself has been completed the architect will deal with the cloisters, which are now in a very unsatisfactory condition. Traces of the destructive effect of ivy roots are everywhere evident. For a time the clinging ivy no doubt strengthened the ruins. When, however, the roots of the creeping foliage had once worked their way between the stones the latter were displaced as the roots expanded. The grounds around the abbey are not as picturesque as they might be, though certainly there has been a slight improvement during the past twelve months. Walks have been laid out, an embankment built along the river-side and planted with willows, and a portion of the ground banked off, to eventually be flooded and made into a lake. There has been no attempt, however, as yet at laying any part of the ground out in pretty garden plots, or anything of that kind. About a week ago Councillor Womersley, the chairman of the Kirkstall Abbey committee, made a present to the Corporation of a neat-looking band-stand. This has been placed about twenty yards from the ruins, and about are provided a number of seats for visitors to occupy on band nights.

Within the past few weeks there has been afloat an extraordinary rumour concerning supposed hidden treasure beneath the ruins. With Mr. Irvine, the clerk of the works, and local antiquaries the idea does not find favour. If there had been anything of the kind one would have thought that in digging the holes for scaffold-poles, or about a year ago when drains

were constructed, that something of this mysterious hidden treasure would have been found. However, extracts from the letters which the mayor, Mr. T. R. Leuty, has received from a gentleman giving the address of Biggieswade, Bedfordshire, may prove of interest. In the letter dated August 12 the writer says:—

"A declaration strange in itself and entirely without precedent has been addressed to Mr. Lumb, of the Thoresby Society. This declaration is based on the belief of treasure trove being concealed at Kirkstall Abbey. Naturally Mr. Lumb and his confrères believe the idea originates in hallucination. The zeal and honesty of the individual who has made the announcement is beyond question, because the expense of failure would fall on him and no moral obloquy would rest on Mr. Lamb and his coadjutors. On the other hand, should the quest prove successful their position would be that of embarrassment and perplexity, because the probability is that they have not the available funds to comply with the stipulated conditions. There seems to be the need of the sanction of the Leeds Corporation through its mayor and chief magistrate. . . . The search for the supposititious treasure will need no exploiting. Its exact position will be defined so that no error can arise, and as it is supposed to be only 6 feet below the surface of the ground, a man could unearth it in about two hours or less. According to the occult message it comprises the articles of silver plate used in the abbey before the dissolution. They are stowed in the huge old plate-box in which they were kept when out of service. This chest and its contents were buried by Henry Pearson, the abbey steward, to prevent the treasure falling into the hands of King Henry's abbey raiders—a precaution which seems not improbable in those wretched times. *Verbum sat sapienti.*

"P.S.—The secret, if so it may be termed, is limited to yourself and Mr. Lumb, and to you twain would belong the honour of the proceeding, if success should crown the quest. I have made the suggestion known to no one else. Please kindly think over the matter, and apprise me with what you think is equitable and right."

Receiving no reply to this communication, the gentleman wrote again on August 16 as follows:—

"The application must have appeared very strange to you. It must have furnished you with sufficient evidence to doubt the sanity of the writer, because it involves a proposal probably without precedent. My present purpose, however, is not to discuss an occult theory, but simply to ask if permission can be obtained of the authority you represent for opening the ground at Kirkstall Abbey for the one and sole purpose of endeavouring to find the location of treasure that is supposed to be hid there. The expense of the excavation I will bear. If this permission be granted, and any buried treasure be found, would you be disposed to grant me one-half of the ascertained value of whatever was thus found?"

"P.S.—I have been waiting for a reply to the proposal I have made to Mr. Lumb, who, I presume, has communicated it also to Mr. Irvine, the clerk of the works. I think they must of necessity be sceptical relative to so strange an allegation. I know that I should be so were I occupying either of their positions. Nevertheless I think it must, in common fairness, be conceded that no amount of scepticism entirely justifies complete silence. Cannot you suggest some reasonable *modus operandi* for bringing the matter to a practical issue—i.e. for confirming the supposition or exploding the pretension? If the allegation is purely mythical, no expense will be incurred and no injury done. If, on the other hand, some concealed treasure exists there and the same can be discovered, would it not be desirable to secure it and adequately recompense the finder? To do neither one thing nor the other, to remain inoperative and silent, does not appear to be the best policy to pursue. If the Society, through its exponent, declines to do anything, will it allow me to make the search, all derelict to belong to the finder?"

Other letters have also been received. It is not likely, however, that the committee will take any action in the matter.

BUILDING REGULATIONS IN SCOTLAND.

At the meeting of the Scottish Sanitary Association on Friday last, Baile Primrose, Glasgow, read a paper on the effect of building regulations on the growth of a city. By the common law of Scotland, he said, the control of buildings in royal burghs was entrusted to an official called the Dean of Guild, who had the status of a magistrate, and in most burghs was a magistrate. The practice regarding the office and functions of the Dean of Guild was not unknown in the royal burghs of Scotland; but, speaking generally, he had jurisdiction to see that buildings within the burgh were not dangerous to the lieges, and that they did not encroach either on the public streets or on the property of neighbours. He had no right to interfere with internal arrangements. The common law jurisdiction of the

Dean of Guild was confined to questions of encroachment and to precautions for the public safety. But it was found that, particularly in large towns, more control was required over new and existing buildings so as to remove or mitigate the evils arising from overcrowding and from unwholesome dwellings. Accordingly a new departure was made by the city of Glasgow in 1862 by the Glasgow Police Act of that year. While taking nothing away from the Dean of Guild, his jurisdiction was considerably extended, and he was entrusted with various matters over which at common law he had no control. As regards streets, the Dean of Guild was by this Act clothed with jurisdiction similar to his jurisdiction over buildings, the object being to prevent in future the formation of narrow tortuous streets enclosed between high houses—such streets as were common in the older parts of all old towns. A minimum width of 40 feet was indicated for public streets, the level of the street was placed under his control, and, most important of all, he was empowered to fix the height of the buildings relatively to the width of all such new streets. While not prescribing any fixed limit to the width of new streets, the result aimed at in the interest of the public health was reached by securing low buildings fronting the narrower streets and higher buildings fronting the broader. As regards buildings, other matters besides mere questions of encroachment were by this Act entrusted to the Dean of Guild. He was enjoined to satisfy himself not only that the walls and timbering were of sufficient stability, but also that the water-supply was adequate, that the drainage was efficient, that the ashpit and water-closet accommodation was ample and that the ventilation was properly secured; he was required to enforce a minimum size for every sleeping apartment, a minimum width for every common stair and entry and a minimum free space in front of the window of every inhabited room; and as regards public buildings, such as halls and theatres, he was entrusted with power to regulate exits and passages. In the exercise of these new and extended powers the Dean of Guild was guided to a large extent by the advice and assistance of the master of works for the city and the experts who acted as assessors (technically called his brethren in Council) in the Dean of Guild Court. But after thirty years' experience it was felt that the time had come for a more thorough control over new buildings, and this led to the passing of the Glasgow Building Regulations Act, 1892. The committee entrusted with the drafting of the Bill and its promotion in Parliament were at the very outset forced to consider the question of the constitution of the Dean of Guild Court, and whether it would not be desirable in the public interest to so alter the constitution as to make it a more representative body, in the sense that the members of the Court should sit there by virtue of popular election, and not as the elect of close corporations. The question was discussed in every aspect, and after mature deliberation it was considered desirable that in the meantime it was not necessary in the public interest to propose any change in the constitution of the Court. It was argued that, standing as the Court did in a judicial position between the local authority on the one hand and the public on the other, it was desirable that so long as the Merchants' House and the Trades' House exercised a wise discretion in the selection of the members constituting the Court, they should be given opportunity to justify their continued privilege by wisely administering the fuller powers about to be placed in their hands. It is only right to say that during the two years the Act has been in operation the Dean of Guild and his Court have exercised the very large powers conferred by the Act with credit to themselves and benefit to the city. Let those responsible for the *personnel* of the Court continue to send as their representatives men of civic instinct and practical knowledge, and they will justify the confidence that gave them continued existence with enlarged powers. The general scope of the Act was twofold—to amend and extend the power of control contained in the existing Police Act, and to confer upon the police commissioners power to make by-laws containing detailed regulations upon the subjects mentioned in the Act, so giving some idea of the extent of the Act and the variety of subjects embraced in it. The most important provision of the Act was that which gave the police commissioners power to make by-laws. The scope of the by-laws was very extensive; it embraced all the subjects already mentioned as having been dealt with to a partial extent in the legislation of the last thirty years. When confirmed by the Secretary for Scotland these by-laws were binding as if contained in the Act, and they might be altered from time to time as occasion required. The result was that the Police Commissioners had power to deal with matters omitted from the Act, and to extend the scope and increase the efficiency of the provisions which the Act contained, as well as to prevent evasions of the statutory provisions themselves. The Police Commissioners had made a set of by-laws, seventy-four in number, but they had been in force for too short a time to permit any definite opinion to be expressed as to their value. They were the first attempt in Scotland to formulate detailed building regulations, and as

such were necessarily experimental. The conditions under which building operations were conducted in the towns of Scotland were so different from the practice in England that the experience gathered by the Local Government Board was of comparatively little use. The aim had been to confine the regulations to those matters in which the community have an interest, omitting everything that concerned merely the private proprietor. This limit confined the regulations to such matters as concern the health or comfort of occupants of urban property, and excluded everything connected with design or controlled by taste or fancy. And this aim had been further limited by confining the regulations, even in those matters which concerned the public health, to measures sanctioned by experience, and upon which there was practical agreement among experts. The Police Commissioners had recognised that any series of regulations which had the effect of either preventing experimental works reasonably conducted or enforcing uniformity would do serious harm to the community for whose benefit they were enacted by preventing, or at least retarding, progress and improvement on a branch of science which is as yet far from perfect. When the Bill was before the House of Commons committee the committee desired to be satisfied that some expert in connection with the Scotch Office should appear before them in order to state that he had gone over the Bill, and was satisfied from his knowledge and experience that there was nothing in it contrary to law or the best Scotch experience in building, architecture and sanitary work. Mr. Muir, of the Scotch Office, appeared before the committee and informed the chairman that the Scotch Office had no official whose experience could guide them in respect of such a Bill, but the committee obtained the services of the architect for the London County Council, who went over the Bill, and was able to assure the committee that all its clauses were in order and equitable. Now that the Local Government Bill was being passed through Parliament, it should be urged on the Government to provide in connection with the Scotch Office, or with the new Local Government Board, an expert of experience who would be able to assist municipalities, burghs and county councils as to the drafting of adequate and proper building regulations. This would also have been a suitable time to have given county and district councils the power not only to draft such by-laws, but also to constitute within the counties courts equivalent to the burghal Dean of Guild Courts, in order that speculative and other builders might not be permitted to erect dwelling-houses and other structures free from all official inspection and control. So far as he was aware this chance had been missed, as nothing up till now appears on the face of the proposed Bill which would confer such a useful power on county or district councils. In conclusion, he reviewed specially the sanitary clauses of the Glasgow Act—provisions which he said could not fail to have a salutary effect in helping to solve the great and growing problem of rendering city life more wholesome and healthful. As the trend of events was towards vaster and vaster aggregations of humanity in our cities, it must be apparent that every well-considered measure such as he had attempted to describe must have a potent effect alike on the growth and well-being of their cities.

Mr. Wm. Mackison said that in Dundee, although they had had powers to form by-laws, these had been in proof over fifteen years, but had never yet been approved by the sheriff; and, as engineer of Dundee, the speaker had just to be a living by-law himself. But he had never failed to protest against anything that he saw to be inconsistent with the health of the community, whether the Act covered the powers or not.

Mr. James Chalmers, president of the Sanitary and Social Economic Section of the Glasgow Philosophical Society, said that as a member of the Institute of Architects of Glasgow he was deputed to go through the minutes of the Town Council for twenty years back, and he found that the inception of a separate Building Act for Glasgow was about twenty years ago in the Institute of Architects, on the motion of Mr. Honeyman. The Institute of Architects of Glasgow went to the expense of printing a special Building Act, and with that Building Act they repeatedly knocked at the doors of the then Town Council of Glasgow with no success. The Town Council persisted in having a Police Act, including in that Act building regulations. He complimented Bailie Primrose that he had been instrumental in carrying out the aspirations of the Institute of Architects. He thought the Town Council should go further, and, as they had supplied pure water, should supply fresh air for each inhabitant.

Mr. Gordon, Hawick, said that he thought one of the defects of Glasgow was that they tolerated ashpits, because, in his opinion, such things could not exist in back courts without becoming a nuisance.

Bailie Primrose, in reply to Mr. Chalmers, said that the Institute of Architects knocked at the door of a Council who, in attempting to prepare an order, had been so severely sat on by the landlord interest that they were not in a frame of mind to receive such a suggestion.

THE PROPOSED WESTMINSTER CATHEDRAL.

THE proposals for a Roman Catholic cathedral for London, which have been under discussion for nearly thirty years, have at last, says the *Times*, taken definite form, and the style of architecture to be adopted has now been decided upon. In 1865, after the death of Cardinal Wiseman, it was decided by a public meeting of Roman Catholics to perpetuate his memory by the erection of a cathedral for the Metropolitan Roman Catholic see; and, subscriptions for this purpose having been invited, Cardinal Manning was ultimately enabled to purchase for 55,000*l.* a site for the cathedral. This consisted of 4½ acres of land on which the Westminster Bridewell used to stand, and which has since been valued at 300,000*l.* Since the death of his predecessor, Cardinal Vaughan has suggested that the names of Cardinals Wiseman and Manning, who both took such prominent parts in establishing the Roman Catholic hierarchy in England, should be linked together and the memory of their services perpetuated by erecting a cathedral which might be regarded as the completion or crown of their work. Although the opinion has been expressed that Cardinal Manning would have preferred to be remembered for his work among the poor to having any monument set up to him, his successor's suggestion evidently meets with general approval among Roman Catholics. Many thousands of pounds are still required to carry out the scheme, but enough money has already been contributed or promised to enable a start to be made. Mr. J. F. Bentley, an experienced ecclesiastical architect, who has designed several Roman Catholic churches, amongst others that of the Holy Rood at Watford, of Corpus Christi at Brixton, and of St. Mary's at Kensal Green, and who has also recently restored the City churches of St. Botolph, Bishopsgate, and St. Botolph, Aldgate, has accordingly been entrusted with the preparation of the plans of the new cathedral. A style of architecture perfectly unique so far as London churches are concerned has been chosen—the ancient Basilican or primitive form of Christian architecture. The original cathedral of Canterbury appears to have been of this character, but there are now only a few Basilican churches in England. Mr. Bentley's plans are to be ready next June, and on the 29th of that month, the feast of St. Peter and St. Paul, it is expected that the foundation-stone will be laid. The model for the new cathedral is to be Constantine's church of St. Peter in Rome, the defects of which will not, however, be reproduced. It will be at least 350 feet long by 170 feet wide and 100 feet high—all internal measurements. It is to accommodate 10,000 and seat 8,000. In addition to the cathedral there is to be a lecture-hall capable of seating 2,000 people. There is also to be a monastery for thirty monks and forty-five lay brethren. The Benedictines, who for centuries served Westminster Abbey, are to be invited, if funds permit, to return. The buildings will, it is expected, cost fully 250,000*l.* before they are completed, and may possibly include a new house for the Archbishop, in which case the sale of the site of his present house would, it is thought, realise a considerable sum towards the expenses. A new house for the Archbishop is not, however, part of the present scheme. Of the 250,000*l.* required not quite half has yet been found, although a single subscriber, who was also the principal contributor to the purchase of the site, is understood to have given or promised nearly 20,000*l.*, and it is not expected that the whole of the necessary money to complete the work will be forthcoming for some time. The fact that the Brompton Oratory cost, without altar or decorations, 89,000*l.*, and St. James's Roman Catholic Church in Spanish Place, 45,000*l.*, shows that English Roman Catholics have had heavy building expenses to defray with the last few years. A suggestion has been made by an influential member of the Church to the effect that the whole of Roman Catholic Christendom should be appealed to through the bishops for support. Meanwhile it has been decided that the name of each person giving not less than 1,000*l.* shall be inscribed on the cathedral as one of its founders, and liberal donations are expected from America and the colonies.

ARCHITECT'S FEES.

IN the Carlisle County Court Mr. Joseph Graham, architect, Devonshire Street, sued the Holme Cultram Local Board for 53*l.* 7*s.* 6*d.* for balance of salary and work done. The case had been remitted from the High Court. In the particulars of plaintiff's claim 30*l.* was entered as salary due on October 20, 1893; 48*l.* 7*s.* 6*d.* fees for work done and money expended as per account rendered—total, 78*l.* 7*s.* 6*d.*, reduced to 53*l.* 7*s.* 6*d.* by cash, 25*l.*, received on account on December 7, 1892. In further particulars of the claim details were given of the numerous visits to Silloth, preparing plans and inspecting for the Local Board *in re* borrowing powers, obtaining names of frontages, preparing apportionments, supervising drainage work and flagging, &c.

The plaintiff stated that in June 1890 he applied for the post of surveyor to the Holme Cultram Local Board in reply to

an advertisement which stated that the work was to have reference to streets "in course of construction." He offered to do the work and pay ten visits for 30%. Plans were supplied to him which were inadequate because no names of owners nor measurements of frontages appeared thereon. Consequently he had to survey the whole of Silloth and obtain the names. That work took him and an assistant over a week, for which he charged 5%. When he tendered for 30% he had expected to find proper working plans already in existence. The work should have been completed in six months, but it took three years. The contractor was delayed by want of capital. Witness paid twenty-five visits to Silloth during the course of the work. Eight or nine times he met the committee at Silloth specially at their request. In August 1890 he met the committee to confer with them about an account, and on February 23, 1891, he had to go and see one of the committee, in order to explain the apportionments. Similar special visits were paid at certain dates ranging from 1891-93. Witness then gave details of the extra work he had had to do in consequence of mistakes in the original plans, &c., the charges under this heading amounting to 48*l.* 7*s.* 6*d.*

Cross-examined: The particulars of the claim were copied out of his diary. An agreement with the previous engineer was never heard of by him until he began to press the Board for the money. He had often verbally complained to the committee of the slowness of the contractor, who had only two men at work, and there was a clerk of the works at 2*l.* a week to look after those two men. He knew he had the power to employ other contractors, but the committee would not allow him to do so. Two members of the committee did not want him to turn away the contractor because he was a decent sort of fellow, and they were willing to give him time. One of the days (November 6, 1890) he met the committee was a Sunday, but that must be a mistake in his diary. He got 16*l.* for taking out quantities for the second contractors.

At the conclusion of the cross-examination the Judge said if the plaintiff had to do all the work he had spoken to, the Board could hardly expect it to be done for 30%.

Re-examined, plaintiff stated that the Board deducted 142*l.* penalty money from the account of Mr. Crosthwaite, the contractor, and he was present when they decided to do that, supplying the information upon which the decision was come to.

An assistant to the plaintiff deposed that he had to go from door to door in Silloth to make the survey requisite to fill up the plan, which, when plaintiff received it, was a mere skeleton.

For the defence, Mr. John Johnstone, builder, Silloth, a member of the defendant Board, was called. He deposed that plaintiff first canvassed him for his support on the bowling-green at Silloth. He told plaintiff he would have to carry out Mr. Bell's plans, make all the apportionments, and make ten visits to Silloth.

Cross-examined: He could not say what happened to the first surveyor. Was he starved off the job?—Witness: He'd be glad to get it, I should think.

By the Judge: He would not care to offer an architect only 30% for three years' work in connection with his buildings.

The Judge said that plaintiff had had to do work which he did not anticipate and he ought to be paid for it. He should refer the matters of detail to the Registrar, unless the parties consented to his giving judgment for a definite sum.

The lawyers having consented to the latter course, the Judge gave judgment for the plaintiff for 34*l.*, including the 5*l.* paid into court.

STREET IMPROVEMENTS.

IN the course of the next fortnight one of the most desirable street improvements that has been carried out in Edinburgh for many years past, the *Scotsman* says, will be completed. Since the first was heard of widening Salisbury Place the Edinburgh Town Council has several times changed its complexion, but though the efforts for the acquisition of the necessary property have seemed at intervals to languish, the important improvement involved has never been altogether lost sight of. About eight years ago a commencement was made with the scheme when certain proprietors came before the Dean of Guild Court with an application for warrant to erect new shops on the south side of the street. The city then seized the opportunity of purchasing a strip of ground to increase the width of the street at that point, but as the rest of the thoroughfare remained as before it was not of itself a great advantage. Efforts were then made to induce Mr. Adamson to set back his office which stood at the corner of Minto Street, but the city failed to get him to consent to what they considered reasonable terms. Then the situation became more complicated by the shop at the opposite corner being brought forward, and it became imperative for the sake of public safety and convenience that the street should be widened. When the new Improvement Bill was promoted, it was decided that this matter should be included, being second only in the estimation of the

Council to the Bristo Street improvement. This was done, the necessary powers were obtained, and in a few days Salisbury Place, which used to be a confined street of 29 feet in breadth, will be a comfortable thoroughfare of between 41 and 42 feet in width. In order to obtain this uniform width negotiations had to be entered into with the tenants of the shops already referred to, in order to set back the front an additional 6 or 8 feet beyond what had been done in the first instance.

CHURCH BUILDING AND RESTORATION.

Brecon.—The reparation of the grand old tower at St. Mary's, Brecon, which stands in the centre of the town, is now being carried out under the direction of Mr. F. R. Kempson, F.R.I.B.A. The utmost care is being taken to preserve old work. Nothing is being replaced except what has been demolished by time, or which is found to be either totally decayed or dangerous. All the framing for the bells will be new as well as the floors. Stone has been selected which harmonises with the old work. Cement is being used throughout instead of lime, and the utmost care has been taken to make the fabric thoroughly substantial. The commencement of the work was delayed for unavoidable reasons, but every effort is being made to complete the more important parts before the coming winter.

Nottingham.—The cathedral of St. Barnabas, Nottingham (R.C.), was reopened on Sunday, the 26th inst., after interior restoration and decoration, the style corresponding with that of the cathedral, viz. pure Early English throughout, from designs by Mr. Thomas F. Norman, ecclesiastical decorator and artist in stained-glass, St. Nicholas Church Street, Warwick.

GENERAL.

The Marquis of Bute is continuing the excavations in the grounds of the priory of St. Andrews, which he lately purchased. Among the recent discoveries have been two heads belonging to statues of Christ and King Malcolm.

Two Oil-Paintings and three drawings have been purchased for the Sydney National Gallery. They are *Virginia di Monte San Giorgio, Perugia*, by Professor Giovanni Costa; *Shorthanded*, by Lionel Smythe; *The Bedouin's Home*, by F. Goodall, R.A.; *Fleet Street*, by Herbert Marshall; and *Gringoire*, by E. R. Hughes. As the amount of the Government grant has not yet been expended, several more paintings will probably be purchased.

The Congress relating to Christian archæology has been concluded at Zari, Dalmatia. It has been decided to publish all the early Christian inscriptions found in Austria-Hungary and Bosnia, with a complete description of the surviving monuments. The next congress will be held in Ravenna in 1897.

M. Léon Cugnot, the French sculptor, has died in Paris. He obtained the Prix de Rome in 1859. Among his works are the figures of *Power* and *Justice* at the Cour de Cassation, *Patriotism* at the Louvre, and the statues in the Salle des Cariatides in the Hôtel de Ville.

The Excavations for the foundations of the new Opéra Comique in Paris are in progress. The concrete will be laid in about a month, and the masonry will then be commenced without delay.

The Jury of the Annual Art Exhibition, which is being held in the Crystal Palace in Munich, have awarded the first medal to the English painter, Mr. Henry Scott Tuke. Medals of the second class have been awarded to the painter, Mr. W. Fusse, and to the architect, Mr. Alexander Koch, of London.

The Aberdeen Artists' Society's exhibition will open in the Art Gallery on October 1.

The Sheffield Society of Artists will open their twentieth annual exhibition of pictures on Monday, September 10. Mr. Herkomer will give a lecture on the occasion.

The Twenty-eighth Annual Convention of the American Institute of Architects will be held in New York on the 15th, 16th and 17th of next October.

The Temperate House in Kew Gardens is about to be extended by adding two wings at the north and south ends, which will increase the size of the building by half its present dimensions. The cost will amount to about 12,000*l.*

Mr. Batsford will publish early in September a new edition of Meyer's "Handbook of Ornament," the first issue of which was exhausted in three months. The new edition has been carefully revised by Mr. Hugh Stannus, F.R.I.B.A., lecturer on applied art at South Kensington, and contains about 3,000 illustrations of the elements, and the application of decoration to objects.

The Architect.

THE WEEK.

THE works committee of the Brighton Corporation have recommended that the whole of the works proposed by Mr. MAY be carried out, and that arrangements for the purpose be entered into. The expenditure is estimated at 47,000*l.* The works comprise the construction of two concrete groynes and a sea-wall for the protection of the front at the east end. One of the groynes will be 500 feet long and 10 feet 6 inches wide, and will be arranged for a promenade. This work will cost 14,000*l.* A sea-wall will also be constructed for the west end at a cost of 19,000*l.* It will be of such a height that neither boating nor bathing will become more inconvenient than at present, and eventually there will be an accumulation of beach in front of the wall which will allow of easy approach to the foreshore. The Madeira Road Terrace is also to be extended for a distance of 1,530 feet, or nearly the third of a mile, at a cost of 14,000*l.* The Town Council appear to be resolved that the supremacy of Brighton must be kept up no matter how great the outlay. It has been already demonstrated that the works for the improvement of the sea-front have brought profit to the town, and those about to be undertaken are likely to be as advantageous.

THE Glasgow Corporation on October 20 appointed a sub-committee to consider the subject of the decoration of the Municipal Buildings with the aid of Mr. WILLIAM LEIPER, architect. Among the buildings visited were St. Paul's Cathedral, London, the Amiens Museum, the Hotel de Ville, the Panthéon and the Palais de Justice, Paris. One of the members also examined the Sistine Chapel and the Stanze in Rome, besides buildings in Florence and Venice. The report states that the principal conclusion to which the deputation came is, that to execute great decorative works the co-operation of great artists is indispensable. It is only thereby that works which will live and will grow in reputation can be secured. The power, the prosperity, the civic pomp of Venice have passed away; but the monuments of the greatness of the city, ordered and executed in the days of its wealth and influence, remain to this moment and to all time fitting memorials of the greatness of the people and of the liberal intelligence which accompanied their commercial and maritime predominance. The artists employed should, in the opinion of the deputation, be controlled by one authority, only to the extent of the harmonious colour scheme and uniformity in the subordinate coloured decoration and gilding and architectural features. The deputation are of opinion that such coloured decoration should be sparingly employed, and that in the figure panels a flat treatment with little shadow should be demanded, so that the wall surfaces may be kept unbroken. The deputation conclude by saying that they were deeply impressed with the magnificence of the mural decoration in the public buildings they saw. It is obvious that the authorities who have such work to perform look upon it both as a great duty and a great opportunity, and there is no doubt that much of the work which is now being placed on the walls of these structures will go down to the future as the richest and most characteristic artistic products of the century. As a practical outcome of their investigations, they have to report that Mr. LEIPER has completed a coloured study, showing a design for the colour decoration of a compartment of the banqueting-hall. He proposes that the large spaces should be made simpler, some of the mouldings which at present sub-divide the panels being removed, thereby forming one large panel instead of a series of smaller ones, the opportunity for a larger and more dignified treatment of wall-painting being given thereby. The spandrels and other circular compartments would be filled with figures illustrative of the arts and sciences for which Glasgow is celebrated. The general scheme of colour would be light without being weak, and would be arranged so as to be a harmonious setting for the wall-paintings. The sub-committee have resolved to recommend the adoption of Mr. LEIPER's project, subject to such modifications on the execution of the work as may be found to be desirable.

It is satisfactory to find that the deputation are able to appreciate the work of M. PUVIS DE CHAVANNES, which was first made known in this country by means of articles and illustrations in *The Architect*. About his work in Amiens it is said:—"Without illustration it is impossible to convey any conception of the soft harmonies, the nobility and serenity of the suggestive allegorical groups with which the artist has enriched his native city. The deputation is safe in saying that nothing more masterly and effective in the way of mural decoration has been accomplished in modern times than has been done by PUVIS DE CHAVANNES in Amiens." In describing the works in the Panthéon, Paris, the report says:—"The colour these wall paintings lend to its walls greatly enlivens the aspect of the interior, and the appropriate subjects illustrated with unsurpassed vigour give a personal and historical interest to the building which renders it peculiarly attractive and pleasing to the visitor. The mosaic pictures in the chancel of the Panthéon, and others subsequently seen in the Louvre, where several cupolas are being treated by this method of decoration, did not appear to the deputation to be so successful as those of Mr. RICHMOND in St. Paul's Cathedral. In the Palais de Justice the deputation also saw two beautiful frescoes, or rather wall paintings, by MERSON, which appeared to be very suitable for their position, the colour being most delicate and refined." There is no doubt that the modern mosaics in Paris are inferior to those in St. Paul's, but if they were seen under the subdued light of London some of their glaring defects might be less obtrusive.

It has taken a long time to persuade the Neapolitans about the advantage of an abundant water-supply, but as they now consume about 44 gallons per head every day we suppose they are convinced. The British Consul reports that the supply is derived from the springs of Urincoli, which are about thirty miles distant from Naples. The water is conveyed by a covered masonry canal lined throughout with Grenoble cement, laid generally at a depth of 3 feet below the surface of the ground. Under the hills there are tunnels; over valleys there are aqueducts raised 66 feet, in one place changing into four parallel iron tubes, 2½ feet wide, which descend into the valley of Cronti, and rise on the opposite side. Two covered reservoirs have been constructed on the hill of Cancellio, about 12½ miles distant from Naples. The reservoirs are at the respective elevations of 68 and 444 feet. From the reservoirs three iron syphons proceed down into the plain and up into the hill of Capodimonte, which dominates Naples. These reservoirs may be reckoned among the grandest works of modern times; they are entirely hewn out of the rock. The low-service one holds 240,000 cubic feet of water in five large tunnels, which are filled to a depth of 27 feet. This reservoir lies 150 feet below the surface of the ground, so that the water is always cool. From the Capodimonte reservoirs the main service pipes branch all over the city, forming a network, with close meshes; the supply is continuous, and there are no domestic cisterns. It will be seen that the water is collected under ground, in pure mountainous strata, at a high elevation. All the reservoirs are subterranean, and the water therefore is never exposed to the open air until it issues from the taps or fountains in Naples. Reservoirs and aqueducts are alike thickly lined with Grenoble cement, rendering pollution impossible. The length of the pipes that feed the city from the reservoirs of Capodimonte was, at the opening of the works, 62 miles. Numerous public fountains stand in all the twelve quarters of the city, and flow constantly.

It may be assumed that the memorials of the late President of the French Republic will afford many commissions to French sculptors and architects. For one which is to be erected in Angoulême the subscriptions have reached the 45,000 francs required. The money will be divided as follows, viz. 40,000 francs for the memorial, and 5,000 francs to reward the competitors who have gained the second and third places in the competition. The jury will consist of the following artists:—MM. MERCIÉ, FRÉMIET, FALGUIÈRE, DALOU and RODIN, sculptors; PUVIS DE CHAVANNES and GÉRÔME, painters; COQUARD ET VAUDREMER, architect.

POLYGNOTUS THE WALL-PAINTER.

AT first sight any inquiry about POLYGNOTUS and his works must appear to be one of those barren subjects which are only adapted for the killing of time. Not only are we without an example of his works and are unable to affirm that any vase or gem or wall in Pompeii bears a copy of one, but there is no authentic fact known about his life, no certainty about the time of his birth or death. The more intense the obscurity about a man the keener is the curiosity which he excites, and the discovery of any trifle becomes important. As long as the world remains we may be sure that inquirers will be found who will derive satisfaction in putting together the few fragmentary statements concerning POLYGNOTUS which have survived, in the hope that by some happy accident they may be made to coalesce.

There is a pleasure in the exercise which is rarely found in inquiries of the kind. POLYGNOTUS was the most favoured of painters. In our time a painter can become wealthy, in England he may attain a baronetcy, and in Belgium he may be made a baron. Some have been favourites with princes, RUBENS was an ambassador, and RAPHAEL was likely to have worn a cardinal's hat. But the Greek painter, if the traditions are accepted, could not be treated with more esteem if he had descended from the clouds. A city was honoured by his presence, and critics dare not find fault with his works.

Yet he was not a Greek by birth. POLYGNOTUS was the son of the painter AGLAOPHON, and his brother ARISTOPHON likewise belonged to the craft. They were natives of Thasos, in the Ægean Sea. The island was famous for its gold mines, marble, wheat and wine. The inhabitants were wealthy, and therefore were often invaded. The Persians seized on the island, and after the great war it was excusable that Athens should take steps to insure Thasos against another foreign invasion by taking possession of so fertile a spot, and converting the Thasians into allies or rather subjects. It was some time in the period 476-66 B.C. that CIMON arrived in command of the Athenian fleet. He had already conquered the Persians in several battles, and he was prepared to win at Thasos by arms or by reasoning. His success had refuted those who had nicknamed him "The Idiot," and he was competent to convince others that his indifference to the polite education which Athens offered to its citizens did not unfit him to originate great public works and to lavish wealth on their adornment. CIMON may have thought of POLYGNOTUS when he undertook the armed mission to Thasos, for at that time there was no painter to be found who was so well adapted to realise the commander's intentions to make Athens express its supremacy in Greece by the beauty of its buildings. The painter's father was described by QUINTILIAN to be at least the equal of his famous son, but on that point there can be no certainty. What seems more likely is that POLYGNOTUS surpassed his father. The statement that he had discovered not only a new process, a sort of encaustic, but had departed from conventions is more reasonable. PLINY has preserved the traditions about his venturing to paint open mouths in order to suggest that sounds were being uttered, and his introduction of transparent draperies and multi-coloured headgear in his pictures. The same author also places POLYGNOTUS among the sculptors, and we may conclude that his departures from precedent did not mean any sacrifice of the noble sculptural simplicity which was supposed to be suited to wall-painting. CIMON was not deficient in refinement, and he was likely to be accompanied by men who were competent to give judgment on questions of taste. Their standard would be higher than that adopted by the travelling dealers, who were willing to purchase the works of POLYGNOTUS by balancing gold against them. But there is another circumstance which convinces us that the Thasian artist must have possessed extraordinary ability. Athens was jealous, and was justified in believing it was the home where the greatest of artists, as of warriors, were to be found. The introduction of a stranger to carry out public works was equivalent to saying there was no man among the citizens who was competent for the office. That declaration would be a crime. CIMON was afterwards banished because it was supposed he was well disposed towards the Spartans, and there must have

been good reasons for approving of the selection of a foreign painter.

The causes which induced the painter to quit Thasos can only be guessed. Wealth was more easily gained there than on the mainland—indeed, most of the works of POLYGNOTUS in Athens were painted gratuitously. But Athens then held sway in all that was believed to be noblest for men, and to win renown within its walls was to come near unto the gods. What else but desire of fame could have tempted POLYGNOTUS? If judged by rules of precedence, the emigration was not well advised. Athens and the country around must have appeared to be ill-adapted for the advent of a great artist. Policy had dictated that the ruin and desolation which were among the effects of the war should remain unchanged, as they became the most eloquent incentive to revenge against the Asiatics. But the painter was likely to be informed of the designs of CIMON, and was glad to take a part in the creation of a new Athens. It would appear that CIMON had secured the remains of THESEUS (the faith of that time was easily disposed towards believing in the providential preservation of relics of the Heroes), and the great temple which still exists was erected to enshrine them. It was designed by MICON, who painted on some of the walls scenes from the contests with the Amazons and Centaurs. POLYGNOTUS undertook a subject that was apposite but not familiar, an event in the life of THESEUS which, according to modern notions, would be an unpaintable subject. He represented the Hero proving that he was the son of NEPTUNE by casting himself into the sea, where he was received by the nymphs and conducted to AMPHITRITE, who crowned him. This suggests a series of subjects rather than one. If interpreted with fidelity remarkable powers would be required, but who can say whether conventional or figurative signs and figures were not introduced which would diminish the difficulties of the painter? In the Temple of the Dioscuri POLYGNOTUS painted the Heavenly Twins carrying off the daughters of LEUCIPPUS, a subject which RUBENS long afterwards attempted, and, as we can see in Munich, made out of it the most glowing of all his works. But while the Fleming was content with expressing the moment when the horses were about to start, POLYGNOTUS depicted the whole legend.

In the next work undertaken by the Thasian, he had the co-operation of PANÆNUS, a brother of PHIDIAS, as well as of MICON. This was the painting of the long Poecile Stoa, or double portico, which was used as a general shelter by the Athenians. While his friends selected the Battle of Marathon and one of the Amazonian combats, POLYGNOTUS selected scenes from the siege of Troy. He was an enthusiastic student of HOMER, and his love of the heroic was fostered by the epics. What made his work remarkable in the eyes of many was the introduction (as one of PRIAM'S daughters and a captive) of ELPINICE, the sister of CIMON, and who was said to be the lady love of POLYGNOTUS. His work in the Stoa gained for the artist the citizenship of Athens.

The number of the mural paintings by POLYGNOTUS is not to be ascertained. Some of them were afterwards brought together in the Pinacotheca; but when PAUSANIAS saw them they were greatly decayed. Among the subjects treated were ULYSSES and DIOMEDE carrying off their spoils from Troy; ORESTES and PYLADES; the disguised ACHILLES among the daughters of LYCOMEDES; the Sacrifice of POLYXENA; ULYSSES and NAUSICAA.

The majority of the paintings could not be considered adequate representations of the subjects unless a great many figures appeared. It is evident also that POLYGNOTUS preferred subjects which enabled him to introduce several figures of maidens. May we not then conclude that he often adopted a frieze-like arrangement for his works, and imparted to the figures an ideal character which made them comparable to the sculptured works to be seen in the pre-Phidian era? What ARISTOTLE says about the figures of POLYGNOTUS being superior to natural beings suggests that the painter followed the ideal. But the testimony of LUCIAN and ÆLIAN to his skilful expression enables us to conclude that he avoided both the placidity of some sculptured faces and the smiles of others. Roman writers have related that his scheme of colour was limited to black, white, yellow and red; but with such a palette PLINY'S "capita earum mitris versicoloribus operuit" hardly agrees.

If the artist restricted himself to one plane for his figures, which would not, however, agree with the descriptions of his paintings, a simple colour scheme would not, however, be unsuitable.

(To be continued.)

OLD ST. PAUL'S.*

WHEN Dr. SIMPSON became librarian of St. Paul's some thirty years ago, he was amazed to find there was only one book in the collection which treated of the cathedral buildings. He not only filled the void by collecting over a hundred and thirty books and pamphlets on the subject, but he used his pen to create some additions. His "Chapters in the History of Old St. Paul's," and "Gleanings from Old St. Paul's," were widely appreciated, and he has now, as he says, completed the trilogy by his "St. Paul's Cathedral and Old City Life." We hope Dr. SIMPSON does not suppose he has exhausted his subject. There is much else which can be treated with advantage by a writer who is so loyal to the cathedral, so unbigoted, so impartial, and so genial. At the present time especially, it is wise to endeavour to persuade the citizens of London that St. Paul's has claims upon their bounty, a circumstance which is not so evident as some dignitaries and other good people may imagine.

Important as cathedrals are believed to be in the ecclesiastical system, and most interesting as they undoubtedly are in the history of architecture, it cannot be said that they ever excited the same affection as buildings which, in an administrative as in an architectural sense, were inferior to them. On the Continent, where there are still opportunities to study this phenomenon, we can often see a noble cathedral deserted, while some chapel close by which has no pretensions to be considered a work of architecture will be crowded with worshippers. The cause of the difference may arise from defects in the human mind and its inability to take broad views. A tendency to devotion does not enable an ordinary man or woman to grasp the significance of the purpose of a cathedral, or the necessity of its clergy. Deans, sub-deans, canons, minor canons, prebendaries, precentors and other officials are so elevated beyond ordinary ministers as to scare rather than attract, for traditions of the pains and penalties of ecclesiastical courts hang around them. Then in a cathedral there are so many chapels, chantries and foundations, the mind must be perplexed in deciding between their claims to attention. What is known about the history of Old St. Paul's and of its successor is convincing evidence that neither was regarded with much reverence. The disrespect which was to be witnessed every day, when the cathedral became a sort of Burlington Arcade, for years before the Fire, was no sudden or temporary lapse; there is proof enough it was long growing. As far back as 1411 a proclamation was issued "that no manere man ne child, of what estate or condicioun that he be, be so hardy to wrestell or make any wrestlyng within the Seintuary ne the boundes of Poules." In the reign of Queen MARY there was a public prohibition of the carriage through the building of great vessels full of ale and beer, great baskets full of bread, fish, fruit and such other things, bales of stuff, and also the leading of mules, horses and beasts, thus showing that in those days St. Paul's was treated as a sort of short-cut by carriers and hawkers.

Laymen were not the only sinners. It is evident that the cathedral was also turned to account for their own convenience by the clergy attached to the building. "As the people so are the priests;" and prior to the Reformation Dean COLET testified to the truth of the prophet's words when he said, "In these unhappy and disordered times residence (or holding of canonries) in the cathedral is nothing else than seeking one's own advantage, and, to speak more plainly, robbing the church and enriching one's self." There was so much attention to private interests and so little thought given to the cathedral, it is surprising the building was not consumed at an earlier date. Following too common a precedent, "with the most culpable neglect the authorities had allowed wooden and other structures in contact with the very walls of the cathedral. In one

case a baker had actually excavated an oven out of one of the massive buttresses." The indifference which was exhibited to dangerous things may have been the consequence of an inherited belief among the canons that it was not wise to take things too seriously. The old custom which JOHN GOUGH NICHOLS describes, if considered in that light, would not be without its use among a people who were prone to take their pleasures sadly, although it would seem to be a more suitable spectacle for Friar TUCK's temple in Sherwood Forest than for the cathedral of London. It related to the reception of venison that was contributed as a sort of rent for land in Essex:—

The buck and doe were offered alive at the high altar of St. Paul's with the following very particular ceremonies. The doe was offered on January 25, the day of the Conversion of St. Paul, and the buck on June 29, the day of the Commemoration of St. Paul. The buck and doe were brought on these several days by one among the sitting servants of the family, and at the time of procession and through the midst thereof were offered at the high altar; after which the person that brought the buck received of the Dean and Chapter 12*d.* sterling for their entertainment, but nothing when they brought the doe. The buck being brought to the steps of the high altar, the Dean and Chapter in their copes and vestments were, besides these, adorned with garlands of roses on their heads. After this ceremony they sent the body of the buck to be baked, while the head and horns, being fixed on a pole, were borne before the cross in another procession round about the church till they all issued out of the west door, when the servant or keeper that brought this buck proclaimed its death by blowing his horn, when he was immediately answered by the horns that were about the City, for which they had each of them paid by the Dean and Chapter fourpence in money and their dinner. The keeper during his stay in town was further provided with meat, drink and lodging, and five shillings at his departure, together with a loaf of bread bearing on it the picture of St. Paul.

Churches with very long naves, like Old St. Paul's, offered opportunities for processions, and the clergy would be glad to find occasions for them. That probably was the origin of the venison ceremony, although CAMDEN supposed it was a survival of the worship of DIANA. On the feast of the Conversion of St. PAUL there seems to have been another procession of a more worthy kind, for FOX describes one in 1555 in which "there were fourscore and ten crosses, one hundred and sixty priests and clerkes, who had everie one of them copes upon their backs."

It may be assumed that in processions the dignitaries of the cathedral would appear in vestments that betokened the wealth and liberality of the citizens of London. The riches of the treasury were suggested two centuries ago by an inventory dated 1295, which DUGDALE reprinted in the third volume of the "Monasticon." Dr. SIMPSON in 1887 brought to notice a still earlier list, one prepared in 1245, besides another dated 1402. In the thirteenth century we find the cathedral possessed four mitres; one was "of white, embroidered in purple, ornamented both in front and behind with stars and crescents; in each star was a topaz or an almandine, whilst in the circle surrounding the head were golden plates pierced with trefoils set with peridots, and tau crosses adorned with gems." There were thirty-seven valuable copes. The Dean's was of purple samnite, embroidered with roses, stars, gladioli and crescents, and parts were covered with *tassellis*, or thin plates, on which were figures of SS. PETER and PAUL. The cope of RICHARD OF ELY was also of white samnite embroidered with leopards and flowers. The Chancellor's was of black samnite with vine leaves, griffins and birds. Bishop WILLIAM's cope was green, with a figure of the Blessed VIRGIN in front, angels bearing censers, archers, &c. The Archdeacon's cope "possessed a hood sewn with pearls, on which was inscribed the name of the Archdeacon, its silver morse set with precious stones, and in the midst an engraved cornelian, whilst the silver-gilt crest of the morse was adorned with engraved sapphires." On the cope of one of the prebendaries the *tassellis* bore a view of Windsor Castle and a portrait of the owner standing at an eagle lectern before a bishop. It was evidently considered becoming that red should be most often used in a martyr's church, for there were fifteen precious copes of that colour while there were no more than two of white, nine red chasubles and three white, eleven ordinary copes and eight white. By 1402 the proportions were altered, for there were fifty-nine copes, twelve chasubles and thirty tunicles of red, and forty-one copes, fifteen chasubles and sixteen tunicles of white. Blue is not mentioned in the early inventories, and is not now

* *St. Paul's and Old City Life.* By W. Sparrow Simpson, D.D., F.S.A., Sub-Dean of St. Paul's Cathedral, &c. Elliot Stock.

used in vestments; but in 1402 there were twenty-seven copes, seven chasubles and twenty tunicles of that colour. In the two lists we find evidence that the ornamentation of the vestments was not always of a kind that could be called ecclesiastical. For instance, the six copes presented by ANNE OF BOHEMIA were "embroidered with golden falcons and with her arms," and among the gifts of JOHN OF GAUNT were copes of cloth of gold and red velvet, adorned with lions and a stag lying in each of the collars, some powdered with golden leopards and some "semées with golden roses and white ostrich feathers." The hangings were also beautiful. The church plate was of gold and silver, and we may be sure included examples by the ablest artists. Among the latter were the cross and images presented by Cardinal BEAUFORT. Dr. SIMPSON, when describing the contents of the treasury, offers a few remarks which should be considered when the shortcomings of the clergy are discussed:—

It is specially observable that many of the ornaments and vestments were, as were also many of the chantries, the gift of the clergy of the church. It is for ignorant and vulgar minds to speak of the clergy of the time as extorting from the laity, under the dread of mysterious penalties, the precious gifts and endowments which were so freely given; but at least it must be remembered that the clergy themselves were generous givers, and the records of the treasures may be put in evidence.

The treasury of St. Paul's, being the nearest, was the most tempting of all to HENRY VIII. and his minions. It was cleared out and the cathedral transformed with remarkable expedition. A year afterwards a few things were presented to the Dean and Chapter which were remarkable on many accounts. Among them were twenty-four old cushions to kneel on, five towels, thirty albs to make surplices for the ministers and choristers; but also "a large canopie of tissew for the King's Majestie when he cometh thither," "bawdkins of divers sorts and colours for garnishing the quire at the king's coming, and for the bishop's seat, &c." HENRY did not forget that his dignity was to be expressed under all circumstances. In the reign of MARY, one of the queen's chaplains, Dr. GLASIER, spoke about the confiscation and implored his auditors to send back the property which had been removed. "I exhort you," he said, "and require you to restore and bring home again such jewels and ornaments as you have unjustly taken away from the churches. Indeed, it were a great shame for so many of you to lie in beds and sit upon cushions made of the church stuff, for which you have paid either little or nothing at all, and the temples and churches of England to stand so naked and so bare as they do." There is no record that the citizens were conscience-stricken and responded to the appeal.

In the third year of ELIZABETH's reign, or 1561, the steeple was set on fire by the agency of lightning and all the timber and lead-work was destroyed. Without delay the Corporation "very frankly and loyngly and wyllnglye" granted three thousand marks towards the restoration, and appointed an alderman and two commoners to be surveyors of the work. That repairs were needed in the next reign is seen from the appointment of commissioners for that purpose by JAMES I. They seem to have employed Portland stone, which was then apparently a novelty in the London market. This fact is demonstrated by extracts from a curious little book of verse entitled "Portland Stone in Paules-Churchyard," which was "written by HENRY FARLEY, a Freeman of London: who hath done as freely for Free-stone, within these eight yeares, as most men, and knowes as much of their mindes as any Man." The geography of the British Isles could not be then taught in schools, for the author has to inform his readers that Portland is in Dorsetshire. There were many writers of verse in those days who were superior to Master FARLEY, but on the subject of masonry he possessed more knowledge, and was not ashamed to display it. The following explanation by some blocks from Portland would not be so interesting if it were more refined in style:—

Ere since the Architect of Heauen's fair frame
Did make the World, and man to vse the same;
In Earth's wide wombe, as in our nat'rall bed,
We have beene hid, conceal'd and covered,
Where many thousand ships haue sailed by,
But knew vs not, and therefore let vs lye.

Till at the last, and very lately too
(Some Builders hauing building to doe,

And time being come we could no longer tarry,
But must be borne from out our earthly quarry)
We were discover'd, and to London sent,
And by good Artists tryde incontinent;

Who (finding vs in all things firme and sound,
Fairer and greater than elsewhere are found;
Fitter for carriage, and more sure for weather,
Then Oxford, Arcafter, or Beerstone eyther,)
Did well approue our worth aboue them All
Vnto the King for service at Whitehall.

It was not only masonry that was looked after under JAMES. In 1620, it is recorded the king visited the Cathedral to see three great windows which were newly glazed in rich colours with the story of St. PAUL. When LAUD was appointed bishop of London, with characteristic courage he resolved to undertake the restoration of the building. He was able to obtain the authority of CHARLES I., and the citizens and companies were called upon for contributions. The Saddlers' Company, the Skinners' Company, the Barber Surgeons' Company and the Brown-Bakers' Company agreed to become subscribers, and we may assume they were not alone in giving their aid. The first work undertaken was the erection of INIGO JONES's western portico. When the Civil War broke out the building was utilised as a barrack for the Parliamentary troops, and the precincts turned into a skittle alley for their benefit. The 17,000*l.* which had been collected for restoration was seized. It was a disappointment for INIGO JONES to lose an important commission, but a worse fate awaited him, for he was charged with delinquency as he had not paid the contributions demanded by the "Committee for the Advance of Money," which in London amounted to one-twentieth of the real property of residents and one-fifth of their personal estate:—

Sir Inigo Jones, Delinquent, Martin's-in-the-Fields, was very vigorously dealt with by the committee. He was assessed at 1,000*l.*, and, as it appears, endeavoured to remove some of his goods out of the jurisdiction of the committee; for on April 25, 1645, the waggons seized in his house were ordered to be delivered up. They were ready packed with furniture and goods. On October 20 it was directed that he should be brought up in custody to pay his assessment. On January 9, 1646, information was laid of goods, plate, money, &c., belonging to him, concealed in his house near Whitehall, or in some rooms in Scotland Yard belonging to him. On January 12 it was ordered that his house should be visited, his goods seized, sequestered and inventoried; on May 15 he was directed to pay in on the following Monday half his assessment for his one-twentieth; on May 25, having paid his half assessment, he is respited fourteen days; and on June 8 his assessment is discharged for the 500*l.*, he paying, in addition, 10*l.* officers' salary.

Was it the intention of Parliament to allow the building to become so dangerous that its demolition would be necessary? Some policy of that sort would seem to have inspired the action of the Council of State about the scaffolding. In 1653 an order was made that the whole of the timber must be sold and the proceeds utilised for the contingencies of the Council. The scaffolding helped to shore the building. After its removal a part of the roof fell down in 1654. Thereupon the Corporation applied to CROMWELL for the lead, in order to convert it into water-pipes. If there was any intention to preserve the building that request would hardly be made. Twelve years afterwards restoration was rendered unnecessary and WREN's opportunity arrived.

Dr. SIMPSON on the present occasion has not introduced more than a few incidents that relate to the existing building. But in compensation he gives the following interesting statement concerning the varieties of stone and marble employed in the cathedral:—

In a manuscript preserved in Lambeth Palace Library (No. 670), containing some account of the rebuilding of the Cathedral after the Great Fire of 1666, I find that the following kinds of stone are enumerated as being used in the works:—Denmark stones, white and red; Burford and Headington, in Oxfordshire; Beer, Caen, Reigate, Ketton, Tadcaster and Guildford; Kentish Hassock and rubble, Ragstone, Swedish, Irish marble, Purbeck paving, white veined marble for pillars, &c. *Paving*:—Welsh and Torbay. Mr. Penrose, the surveyor of the Cathedral, has been so good as to send me a list of the marbles which to his knowledge have been used in the more recent constructions and repairs of the Cathedral. It is as follows, omitting the ordinary white and greyish Carrara marble. *The Pulpit*:—The yellow is mostly Siena, but there is a little of the ancient Giallo Antico, brought from Rome. The green is Greek; from the Isle of Tenos. The red columns, Cork marble. The dark purplish columns, Anglesea. The grey columns, Plymouth. *The South Transept*:—The columns, Rondone, a district of Serravezza, near Pisa. The plinths, Ippelen, Devon. *The West Front, the Landing to the Great Steps*:—The red is Greek,

from Laconia, supposed to be the quarries of the Rosso Antico. The dark grey, Porto Venere, near Spezia. *Dean Milman's Monument* :—The panels, Serpentine, from Levanto, near Genoa. *The New Steps* :—Dark Syenite, a kind of granite from Guernsey. *The West Area Posts* :—Granite, from the quarries of Shap, in Westmorland. *The Black Marble for Pavements* :—From Polash in the Isle of Man. *The Green Marble used for the Pilasters in the Apse* :—From Varallo, North Italy.

We look upon Dr. SIMPSON'S "St. Paul's and Old City Life" as almost a model book on an archaeological subject. It belongs to the class of which M. THIERRY'S "Récits des Temps Mérovingiens" is the leading example. There is no effort in the pages to sacrifice accuracy to an apparent completeness that must be delusory. What Dr. SIMPSON gives can be accepted literally, and be employed as materials for mental pictures of many of the scenes which were transacted within and around Old St. Paul's.

THE ORIGIN OF GOTHIC ARCHITECTURE.*

THE ornamental arts are a continuous development from certain primary forms or motives. The originals, or the derivatives, were made by primeval man as a means of delineating certain sensations or experiences that were newly discovered by him, or of which he became mentally conscious for the first time. It was the opening of a new field of exercise for human endeavour. The architectural art is a divine record of the progress of humanity. The soul speaks in art that of which the mind is unconscious. That which is known, the past, is detailed by knowledge; that which is not known, the future, is expressed by the soul in the poetries.

The first diagrammatic illustrations made by man proceed at once upon diametrical paths of development. One of these is literal representation and the other illiteral. The former is the systematic progress that develops into alphabets. The latter is the cultivation and expression of faith. It is ornamental as opposed to the useful. In the course of man's advance in development he establishes an ideal that is beyond his comprehension. Both courses of progress are finally directed upon this imaginary ideal, which has become a standard that draws them together until literature and art are united in poetical expression. This is a combination from which a higher consciousness may begin a repeated development in a similar manner. That portion of humanity which has laboured in the progress acquires a new comprehension. The delinquent ones continue the progress under changed circumstances.

Greek art marked a final possibility of man's mental growth. Beyond their refinement of what is known as classic detail of ornament the designer cannot go. Neither can mind exceed in their philosophical comprehension. Modern intellectual development is simply a repetition of their progress in the development of their reasoning powers. Owing to other circumstances facts are more varied, but mental power is not now any more comprehensive. Greek ornamental derivatives originated in the representations of material sensations. By discipline a state of involuntary exercise was arrived at in both the literal and illiteral branches of development. They were finally united in translating the Greek ideals of faith. This combination in poetry and sculptured architecture was a mental exhibition of their ideas of the one supreme power. From this apex of development the new and higher process of emotional growth began. The completion of the intellectual circuit made a higher plane available. The work proceeded upon that plane, and they who had not obtained full mental growth had additional labour to perform. The mentally perfect gradually disappeared with the disappearance of faith.

The higher experience which the world entered upon nineteen centuries ago was emotional expression by its mastery and comprehension. It was the beginning of a power as much superior to the intellect as the mind is superior to the physical man. Gothic architecture and ornament is the natural expression of a progress of this new growth. Gothic art and all art, it must be remembered, is the opposite of religion, as commonly understood. The modern symphonic drama is its culmination, and bears the same relation to this new sphere of exercise as the Pantheon, created by the Greeks, did to their accomplishment. The old philosophical process, best represented then by Socrates, accompanies it as the natural mental condition of the present.

The principal orders of architecture are Mohammedan, the feminine; Grecian, the masculine; and Gothic, an expression of both. Roman, Romanesque, Byzantine and many other styles are variations upon the principal themes. The Eastern and the Greek schools of design have their points of departure. The Gothic form of architectural expression appeared in Europe with its detail already developed into architecture. All things have a first cause. If the origin of Gothic ornament is

not in Europe it must be in some other country. If not on this earth, it must be on some other planet. Art is unconscious development and cannot differ from the usual system, neither can it deceive. Even a study of the Chinese language in relation to architectural ornament will prove this same rule. Classic ornament began in the delineation of material sensations. Owing to a necessarily higher condition, Gothic ornament must have begun in a delineation of mental sensations. From this point development would finally arrive at the control of emotional expression in a distinct medium without the intervention of thought.

According to all authorities, the architecture and ornamentation of Central America is without precedent or connections. It had its isolated beginning and progress until the extinction of its practitioners. It is independent of the fundamental characteristics of other styles. The origin of Central American art is so undoubtedly recent that it must be the beginning of this superior plane of experience; the world as a whole never presents opportunities for degeneration; that is natural law. Only one opening is left here for a point upon which to attack the subject. The ornamental forms had their beginning in the illustration of mental facts or conditions first realised. Language was too imperfect a means of demonstrating the circumstance. Language fails when the emotions are stirred, and such was the case here in its primeval form. Through their emotions an influence acted upon their minds and their impressions were pictured in clay. The first erections may have been temporary, and afterward more or less permanent. Gradually they were adapted to use, and the means of expression became architecture with new decorations.

The ornamental motives of Central America are derived from figures of the Latin cross, the shepherd's crook, the fish the stairs of ascent and the reptile. The latter is a representation of an eel that once inhabited the waters of the neighbouring seas. It is distinguished by a dorsal fin upon the head. In their representations it has the rattles of the rattlesnake. The trinitarian character of man or their deities is indicated in various manners. The representation of sound waves plays an important part, and under circumstances that indicate that interpretation. One rebus may read that a people divided are united by the voice of God. The cessation of tribal hostilities, a short time before the Spanish invasion, seems to have been under the influence of this idea. Their manner of offering human sacrifice by cleavage may also have been its corruption. All ideals are debased by mistaken religions. Taking the matter as a whole, they were affected by Christian notions. So much for the original derivatives.

Literal development in this case was imitative representation of nature, and finally conventionalisation. The tooth ornament, beak-heads, and ball and star mouldings of Gothic art were here invented. The cruder forms correspond to inexplicable characteristics of Irish architecture. The Norman detail, with its nebule embellishments, is a perfect continuation of the transatlantic ornaments. The pointed arch also has its beginning in pictorial use. The dates of execution assist in establishing the consecutive growth of this art from one country to the other.

The illiteral development of Central American architecture is the expression of the artist-sense, feeling. It is the underlying power in humanity, the control of which leads to emotional expression. It is the truth in æsthetics and the quality of character. The architecture of the North American isthmus is dignified and serious. In pyramidal development, in stairs and terraces, a desire for attainment and ascent is expressed. The emotional expression of the pyramids of Egypt is concealment, here it is proclamation. They strove for a closer contact with that higher knowledge or sense that was dimly beginning in their consciousness. Their work abounds with that feeling that prompts an effort for greater height. Emotional influences control the mind, and thence the labour of the hand. Their work as a whole was under the influence of a longing to surmount. That is also the emotion of the Gothic cathedral—aspirational ascent.

Architectural ornamentation expresses the esoteric growth of man. He is not conscious of this until it bursts upon him after accomplishment. There may be more truth read from ornamentation than appears upon the surface.

Mohammedan and then Greek, and finally the cathedral architecture flourish upon the purity of their original inspirations, even though one may seem comprehensively above the other. Modern art, in proportion to the successful adaptation of precedents to exigencies, expresses the sincerity with which humanity endeavours to approach the truths of life. That recovery is the mainspring which will begin the transformation of the coming world of thought and art. Man is slow in believing what is understood with difficulty. Truth is never proven so quickly as by those who try to disprove it. The fact of the origin of Gothic architecture can be better demonstrated by such as have the leisure for archaeological research.

* A paper by Mr. C. Bryant Schaefer, published in the *Inland Architect*.

TESSERÆ.**The Art of the Arabs in Egypt.**

THE potent influence both for good and evil of the Muslim faith upon Arab art, deadening and almost nullifying in the case of painting and sculpture, but elevating and ennobling when brought to bear upon their architecture, renders it difficult to assign to it a just position. In this respect the art of the ancient Egyptians, of Greece and Rome, and the development and application of art in India and China present a marked contrast. In these latter countries the religious faith of the people has greatly influenced their treatment of painting and sculpture, and in the case of the Greeks especially has afforded to it a vitality which has exerted a powerful influence over the culture and civilisation of the world. Christian art, subjected, at least in modern times, to trammels similar in kind though less in degree to those imposed upon the Arabs by their religious prejudices, has never lost its hold upon the nations of Europe, nor has Puritan zeal even in Protestant England succeeded in effacing the influence it yet continues to exert. Thrown back upon the resources which were yet at their command, the Arabs concentrated their energies upon architecture, and their inventive faculties developed almost a new art in the style of decoration which lends so much grace and beauty to their buildings. It is a significant fact that the obstacles which have arrested the full development of art amongst the Arabs should have fostered the growth of a style of architecture so admirable in its adaptability to the ends which it subserves, and yet appealing at the same time to the sympathies of men alien to the creed and institutions under which it flourished. Persian art, less under the influence of these restrictions, inasmuch as it admits under a modified form of the rendering of natural objects, has never, at least in architecture, reached the perfection attained to by the Arabs, who have made Egypt a central point for the erection of their noblest monuments. The mosques of Cairo and the examples of domestic architecture which yet remain are evidences of the high position attained to by their designers, and justify the dismay with which their neglected condition fills the minds of all who are capable of appreciating their beauty. It is a sad commentary upon the boasted civilisation of a century now drawing to a close that no hand has yet been lifted to avert the doom of some of the choicest monuments existing in the world. The surpassing interest attaching to the remains of ancient Egypt has to some extent thrown into the shade the products of a later phase of civilisation. The mystery which enshrines the monuments of a race so long extinct, their simple grandeur and their enduring strength, have drawn towards them the attentive study of some of our highest intellects. The key to the right understanding of their inscriptions has been eagerly sought after, and the almost unlooked-for success attending their anxious search has afforded a fresh impetus to the prosecution of labours to which the Government have lent their tardy support. Thus we no longer hear of temples quarried out in order to provide material for a tawdry palace, or of their columns being burned for lime—a proceeding connived at by several of the late Viceroy's of Egypt.

The Cancellaria, Rome.

The Cancellaria is a pile of imposing magnitude, and remarkable for its spacious cortile, surrounded by open galleries formed by ranges of arches resting upon granite columns. Although such a combination of the column and arch constitutes in itself a mixed style, as it was here managed by Bramante it is at least free from absurdity, for he suppressed all appearance of entablature, and made his arches spring immediately from the abaci of the columns, which with the capitals may be considered as the impost's surmounting circular instead of square piers; whereas blocks made to resemble pieces of an entablature not only cause the supports to look too much as if built up of fragments, but call attention still more forcibly to the inconsistency of the two systems of architecture by exhibiting the horizontal members, which columns were originally intended to support, so mutilated as to destroy all idea of connection in a horizontal direction. We may therefore so far allow that Bramante proceeded upon rational principles, and likewise that he consulted effect no less than propriety, the mode adopted by him being more satisfactory to the eye as well as to the judgment. In the façade of the same building, which has two orders of pilasters above a lofty rusticated basement, he was not so happy, and he either did not aim at the character of the antique or else failed in his attempt. In proportion to the building the orders are too minute to assist the idea of magnitude otherwise than at the expense of their own importance. There is magnitude in the general mass, but not in the constituent features. The arrangement of the pilasters again is more unusual than agreeable, for they cannot be said to be coupled, but distributed so as to form wider and narrower intercolumns alternately; in the former are placed the windows, while the others are left blank, a mode which, without possessing the richness of coupled columns or pilasters, is equally if

not still more objectionable than they are. Another circumstance which does not contribute greatly to beauty is that the windows of the principal floor as those of the basement are arched, although crowned by a horizontal cornice, owing to which they have a heavy look in themselves, and also appear squat and depressed in comparison with the range above them. Nearly the same peculiarities, which may be taken as in some degree characteristic of Bramante's style in buildings of this class, prevail also in the façade of a palace begun although not finished by him, in the street called Via Borgo Nuovo. This mansion, now called the Palazzo Giraud, has, like the Cancellaria, two orders of pilasters, forming narrow and wide intercolumns alternately, and arched windows to the first order, crowned by a horizontal frieze and cornice, but with these differences, that the lesser intercolumns are narrower than in the other instance, although still of too great width to allow the pilasters to be termed "coupled," and the arched windows are there wider and loftier than the others.

Rusticated Masonry.

It is an error to suppose that rusticated work is incompatible with elegance and elaborate finish. It is true that it admits of great rudeness and severity of character, but it also admits of the most studied and elaborate finish. So far, too, from requiring less care and accuracy than usual, the arrangement of the courses and rustics so as to combine them in perfect symmetry with arches, windows, &c., is a work of more thought and labour than would suffice for designing half a dozen Grecian porticoes. Much of the beauty of rusticated fronts depends upon the form and proportions of the arches or openings, and on the arrangement, &c., of the rustics which form the voussoirs either to arched or straight-headed windows. Occasionally moulded archivolts are substituted for radiating voussoirs, but the effect is not good, because they cut the horizontal joints of the courses very disagreeably, which, it may be observed, is likewise the case where the voussoirs form an extrados either concentric with the arch or making a more elevated curve, as in most of the Florentine examples. It is far better to make the voussoirs elbowed, so as to unite with the horizontal courses, whereby the whole looks firmly bonded together. Sometimes impost's to arches are omitted altogether, or if there be such member it is usually a mere plat-band, although occasionally it is moulded. In arches the keystone may either be similar or distinguished from the other voussoirs, which last may be done in a variety of ways, although the most usual one is to cut it into the form of a console, or else enrich it with a mask sculptured upon it, of which kind are the keystones to the arches of the Strand front of Somerset House, representing the nine principal rivers of England personified as old men. "Bossages" is a term more particularly applied to rusticated cinctures on the shafts of columns, which may be either square or cylindrical, but should not greatly exceed the diameter of the shaft itself, more especially in the former case. Columns of this kind ought invariably to be engaged, and the wall behind them of course rusticated also. In such case the cinctures serve as ligatures to bind and incorporate them with the rest, whereas insulated columns with blocks upon their shafts are equally unmeaning and uncouth. The same remark applies to rustic blocks stuck at intervals upon the architraves of doors and windows, as, for instance, those of St. Martin's Church, London, although there is no rustication in that building. Of columns with bossages or rusticated cinctures, the two arches within the court of Somerset House are a tastefully-designed and well-executed example.

Alderman Boydell.

John Boydell was designed for the profession of his father, that of a land surveyor, to which for some time he attended; but having, it is said, accidentally seen a volume of views of country seats by Baddeley, his taste was developed, and he resolved to become an engraver. He accordingly proceeded to London, where, though at the age of twenty-one, he bound himself for seven years to Tomms, the engraver, for the purpose of learning the art. At the expiration of his apprenticeship he published by subscription, in 1746, a volume of his own engravings, consisting of one hundred and fifty-two views in England and Wales, price five guineas. They are now interesting chiefly as an indication of the imperfect state of the art in England at that period as compared with the improvement effected afterwards by his own exertions. Indeed he never himself excelled as an artist, a fact which his judgment and candour induced him often to acknowledge. These humble specimens served, however, to commence a very long and continuous course of prosperity, for with the profits of this publication he entered into business for himself as a printseller, and by the adoption of a very liberal policy in employing and amply remunerating the best artists of the time, he gradually extended his speculations, and acquired a large income and a great reputation as an enterprising and generous patron of genius. He engaged Woollett to engrave the celebrated pictures of *Niobe* and *Phaeton*, paying for the former 100

guineas and for the latter 120. They were sold by Boydell at 5s. each, but have since at auctions produced 10 and 11 guineas. In short, he contrived to employ every aspirant to distinction whose energies wanted encouragement. When Boydell began business there were no very eminent English engravers, and they were generally inferior to those of the Continent. Our foreign commerce in this department consisted wholly in importations, and the cabinets of collectors were principally furnished by the artists of France. But when, after many years of persevering exertions, Boydell succeeded in forming an English school of engraving, the circumstances were reversed, for the importation of prints was almost entirely discontinued, and a large exportation ensued. Holland, Flanders and Germany were the principal markets in which the engravings of Boydell were in demand. The complete success of his patronage in the province of engraving, and his indignation at the opprobrium which foreigners cast upon his countrymen for the deficiency of their taste in other departments of the fine arts, led him to attempt a similar improvement in the art of painting. For the accomplishment of this design he secured the services of all the first artists in the kingdom, and selected for illustration the works of Shakespeare, as supplying the most appropriate subjects for eliciting and displaying the abilities of each individual. An English school of historical painting was thus established. West, Opie, Reynolds, Northcote and others were all employed. Spacious premises were purchased in Pall Mall, where, in the famous Shakespeare Gallery, those paintings were exhibited for several years. The beautiful plates which, under the liberal patronage of Boydell, were engraved from these numerous paintings, form a magnificent volume in royal elephant folio. In 1804 at the advanced age of eighty-five, and having, in consequence of the commercial obstacles occasioned by the wars of the French Revolution, become involved in unavoidable difficulties, he obtained an Act of Parliament enabling him to dispose of the paintings of his Shakespeare Gallery by a lottery. In the memorial of his situation he states that his enthusiasm for the promotion of the arts induced him to lay nothing by, but to employ continually the whole of his gains in further engagements with unemployed artists; that the sums he had laid out with his brethren in the advancement of this object amounted to 350,000*l.*, and that he had accumulated a stock of copper-plates which all the printsellers in Europe would together be unable to purchase. He lived only until the last ticket of his lottery was sold. The affair was finally decided subsequent to his death on December 12, 1804.

The Greek Painters and Perspective.

That painting in Homer's time was still in its infancy is not only supported by the authority of Pliny and other writers, but is grounded upon the decisive proof afforded by the works of art enumerated by the ancients, that many centuries later art had not advanced much further, and that the paintings of a Polygnotus, for instance, would be far from able to sustain the test which Pope believes the pictures in Homer's "Shield of Achilles" are capable of undergoing. The two large pieces of this master at Delphi, of which Pausanias has left us so minute a description, are plainly devoid of all perspective. The ancients possessed no knowledge of this branch of art, and what Pope adduces to show that Homer had some idea of it only proves that his own ideas of it were of the most imperfect nature. "That Homer," he says, "was not a stranger to aerial perspective appears in his expressly marking the distance of object from object; he tells us, for instance, that the two spies lay a little remote from the other figures, and that the oak under which was spread the banquet of the reapers stood apart. What he says of the valley sprinkled all over with cottages and flocks appears to be a description of a large country in perspective. And indeed a general argument for this may be drawn from the numbers of figures on the shield, which could not be all expressed in their full magnitude, and this is therefore a sort of proof that the art of lessening them according to perspective was known at that time." Mere observance of the law, derived from optical experience, that a distant object appears less than a neighbouring one is far from constituting perspective in a picture. Perspective requires a single point of view, a definite, natural horizon, and it was in this that the ancient paintings were deficient. The ground in the pictures of Polygnotus was not horizontal, but was so excessively raised at the back that the figures which ought to have stood behind appeared to be above one another. And if this position of different figures and of groups of them was universal, as seems to be shown by the ancient bas-reliefs, where the hindmost figures always stand higher than and overlook the foremost, it is natural to assume that it is employed in Homer's description, and that those of his designs which in accordance with this practice can be combined in a single picture are not needlessly separated. Consequently the twofold scene in the peaceful town, through the streets of which a joyous wedding procession moves, whilst a weighty lawsuit is being decided in the market-

place, does not necessarily involve two pictures. Homer certainly might easily think of them as one, since he pictured the whole town from so high a point of view that he could obtain an uninterrupted view of the streets and market-place at the same time. Real perspective in painting was discovered, as it were, experimentally by means of scene-painting, and even when this last had reached perfection it must have been still far from easy to apply its rules to a picture painted on a single surface. At any rate, in the paintings of a later period among the antiquities of Herculaneum such numerous and manifold offences against perspective are to be found as would not be pardoned even in a novice.

Metrical Repetition.

There is one source of pleasure in all the arts, concerning which much doubt may arise whether it is to be classed among the pleasures of sense or above them. This is the beauty of equal-timed or equal-spaced repetition. It applies equally to the eye and the ear, substituting space in the former case for time in the latter. The unmixed operation of the principle is seen in children placing objects in a line at regular distances, or repeating a set of unmeaning syllables over and over again to weariness. Yet the same principle is carried into the highest arts, and leads to the rhythm of poetry or the equal spacing of the windows of a palace. In examining its nature it may be urged, on the one hand, that as isochronism in vibrations, whether of sound or light, pleases the organ of sense and not the mind (since it cannot possibly follow or distinguish such rapid pulsations), so we may infer that the same property in these far less frequent repetitions pleases us in the same manner, and is therefore not to be classed above more sensuous beauties. On the other hand, it is remarkable that the beauty of a line of equidistant objects (a colonnade, for instance) is universally admitted to be increased when it is seen obliquely, that is, when the perspective images formed in the eye are not equidistant. Thus it would seem they are not so pleasing when seen to be equidistant by the eye as when they are only perceived to be equidistant by the mind; and this would lead us to rank this source of beauty among intellectual ones, for we have something like a reason to advance on this side of the question against a mere analogy on the other side. The chief charm of this quality in architecture is to be traced to its expression of courtesy and consideration for the spectator. For everyone must perceive that in a modern complex building the openings cannot be equally spaced, and at the same time made to suit the internal requirements without a great deal of thought and contrivance, not a particle of which is thrown away, but always leaves its stamp on the work, and the quantity of which constitutes the value of every work of art. Nothing is more essential, therefore, to the first aim of architecture than this equal spacing; every deviation from it, without any reason appearing externally, is an obvious sacrifice of the spectator to the idol self, and hence a breach of courtesy, and if very glaring, an insult.

Mediæval Seals.

The age of English Mediæval seals, which are never dated, may be approximately discovered from the style of lettering of the marginal inscriptions or legends. From about 1066 to 1175 Roman capitals were used; from 1175 to 1215, rude Lombardic capitals; from 1215 to 1350, good Lombardic; from 1350 to 1425, bold black letter; from 1425 to 1500, fine, close black letter; and from 1500, Roman capitals.

Architecture and Imitation.

Architecture is in the strict sense of the word the art and science of raising complicated and handsome buildings, and the Germans are quite right in calling it *Baukunst*. The mere construction of a building is for the most part, if not entirely, a work of science; but in ordering the disposition of parts which make it a handsome building there is an opportunity of showing taste and exercising artistic discrimination, and it is thus that architecture assumes the dignity of an art. So far the architect has drawn no inspiration from nature. The formation of his ground-plan, his elevation, his roof, his gables has nothing to do with nature. They may be geometrically shaped for scientific reasons, but the different parts are constructed by science to suit necessity or convenience, and architecture, as an art, has nothing to do but to group and arrange them tastefully and judiciously. It is plain therefore that architecture proper has not for its object, like sculpture and painting, the imitation of forms external to itself. The ornamentation of buildings involves an appeal necessarily to the sister art of sculpture, and frequently, if not necessarily, to that of painting. As Professor Donaldson, president of the Institute, observed, architecture cannot very well exist without the other arts. But as soon as the architect shapes a moulding in a doorway to obviate the bareness of the splay, he invokes the aid of sculpture, and the imitation introduced in this and any other ornament belongs to the art that brings it in, and not to architecture proper.

NOTES AND COMMENTS.

THERE is no country in which a stronger affection for ancient graveyards is exhibited than in Ireland. It must be allowed that the affection is not of much account in upholding the amenity of the burial-places, which are generally left in a most neglected condition. But the island abounds in anomalies. When the graveyard is attached to an old abbey or church, as is generally the case, the interments interfere with the preservation of the ruins. A case of the kind is now under the consideration of the Local Government Board. At Sligo a part of an ancient monastery has survived which includes three sides of the cloisters, the walls of the church, with a fine east window. The place was recently made over to the Irish Board of Works in order to preserve the ruins, under the Ancient Monuments Act. Sir THOMAS N. DEANE, R.H.A., reported on the condition of the ruins, which are neglected, and are likely to suffer grievous injury from the use of the grounds as a cemetery. The cloisters are now almost concealed, owing to the elevation of the soil and the height attained by the weeds. The Commissioners of Works can expend money in upholding the masonry, but they have no power to interfere with interments. Expenditure on conservation would, therefore, be wasted, for as long as the present system of burial continues the walls are in danger. A great many of the inhabitants are opposed to interference with the graveyard, while the medical officer of health considers that if there is not a change it will become a public danger. The Corporation of Sligo have no authority to undertake the care of the place, the power of the Commissioners of Works does not extend beyond the remains of the buildings, and the Local Government Board must be inactive because the ground is not a cemetery duly placed under official control. In the embroglio, it is to be hoped the ruins will not suffer.

THE parliamentary committee of the Manchester City Council have made several suggestions with respect to the adoption of the principle of "betterment." One is that the person appointed by the Local Government Board, prior to the commencement of the improvement, to make the valuation of the properties, is to hear all parties interested, and their expenses, as fixed by the Local Government Board, are to be paid by the Corporation, in addition to the cost of the valuation. Another is that the betterment assessment is to be made by the Corporation not sooner than twelve months nor later than three years after the completion of the improvement. Any person objecting to the assessment may claim to have it determined by a jury instead of by the arbitrator. The costs of the arbitration or the inquiry before a jury are to be paid by the Corporation, unless the award be for the same amount of betterment as that assessed by the Corporation or a greater amount, in which case each party shall pay their own costs and one-half the costs of the arbitrator or jury. Another amendment of the Bill is that an owner or lessee upon whom the betterment assessment is made may claim to set off any worsenment arising from the improvement in respect to other property of his in the immediate neighbourhood. The determination of this question devolves upon the arbitrator. Provision is introduced by which the betterment charge may be redeemed at thirty-three years' purchase. Another addition is that the owner, or a lessee having not less than twenty-one years' unexpired, has the right of notifying to the Corporation his requirement that they should purchase the property comprised in the betterment charge at the price stated in the initial valuation. The Corporation must then determine whether they will purchase the property or abandon the betterment charge upon payment of the expenses incurred.

A FEW alterations have been made in the prescribed work for obtaining art master's certificates under the Science and Art Department. In group 1, subject 8, an outline of the figure from the cast, it is said "the drawing should be a careful and accurate rendering of the contour of the figure and of such of the forms within the contour as can be rendered, or in some measure expressed, by a line." For subjects 14 and 22 will be required "a study, in colour, of a growing plant from nature, not pictorially represented

(i.e. with accidents of light and shade), but simply and directly drawn, with details (separately if required) selected by the student as being characteristic of its growth and suggestive of ornament, together with three designs based upon the plant. These designs must occupy, in a decorative way, a square, a circle and an oblong. One of them must be in monochrome, one in two colours, and one in polychrome. In each case the plant must be not merely composed into the given space, but treated in accordance with decorative conditions." Among the works required in group 11 are "a set of fifteen studies of ornamental design, showing the treatment of diapers, friezes, borders, panels, pilasters, &c., from original examples in colour or relief, either in the South Kensington Museum or elsewhere. The date, style and local origin of the example must be given on each sketch, and the series should analytically illustrate modifications evolved during various periods." Also "a drawing of a flowering plant, with three distinctly different designs for patterns based on the plant. Each of these three different designs must be suited to the technical requirements of one of three different processes of manufacture; such, for instance, as embroidery, inlay, printing, wrought metal, weaving, painting, &c. The process and material for which it is intended must be named on each design. One at least of these designs must be executed in body colour or tempera." Another, and for some a more difficult, test awaits the candidate in group 3. He will have, besides other drawings and paintings, to prepare "two drawings in outline of the same antique figure or living model, or of one or two photographs from nude figures by M. ANGELO in the Sistine Chapel; within one outline the bones of the figures are to be indicated, and within the other the muscles," besides "a design, drawn or painted, of ornament and human figures as applied to decorative or industrial art. This design should be not less than 15 inches in its longest direction. It is essential that human figure should form an important feature of the ornament designed." In all these exercises it is evident that candidates who have not mastered principles are not likely to succeed.

IN England few but those who have a personal interest in processes retain much faith in sewage utilisation. The aim seems to be now to discover the least costly means of getting rid of sewage. In America people appear to be more sanguine. Mr. G. E. WARING, C.E., who has a reputation as a specialist, in his "Modern Methods of Sewage Disposal" (SAMPSON LOW, MARSTON & CO.) says that "the possibilities of a large return from sewage cultivation are great, and it cannot be doubted that they may sometimes be so developed, in continued practice, as to constitute a source of considerable income." But he does not give any balance-sheets. The superintendent of a lunatic asylum informs Mr. WARING (who planned the arrangements) that last year they raised a crop worth 170*l.* on a field of four acres, but the nature of the crop and its cost are not stated. It is quite possible that there may be places where profit is obtainable, but the best way to deal with the problem of sewage disposal is to seek for a process which will entail a minimum loss. Mr. WARING evidently prefers the utilising of sewage as a manure to any conversion of it into cement, bricks or other things which will confer a sort of permanent character on it, and English experience favours that view. He shows much respect for English investigations, but in this country the parts which describe the American inquiries are likely to receive most attention, and especially those which were undertaken for the Massachusetts State Board of Health.

IN Belfast we expect to see shrewdness and economy exhibited in all transactions, and the new additions to the Art Gallery of the city exemplify those qualities. Some members of the committee lately visited the continent in order to purchase examples of various sorts to increase the collections. They wisely took care to obtain about seven hundred photographs of buildings ranging from the early days of Christianity to the end of the eighteenth century. Details as well as general views were obtained. The collection is likely to be permanently attractive, and it would be impossible to lay out a small sum of money on educational objects to more advantage.

STATUES OF SOME WELSH SAINTS.

THE figures in our illustration represent the patron saints of several old Glamorganshire parish churches which have recently undergone reparation. The churches dedicated to St. CYNWYD, St. GEINOR, St. DAVID and St. NICHOLAS have been restored by Miss OLIVE TALBOT, of Margam Park, at a cost of about 15,000*l.* The figures are carved in Portland stone, and were executed by Mr. W. CLARKE, sculptor, of Llandaff. The various restorations were entrusted to Mr. G. E. HALLIDAY, architect, of Llandaff and Cardiff.

COTTAGE AND STABLE AT HUNSTANTON, NORFOLK.

THE local stone known as "Car," a stone of rich brown colour and coarse texture, has been laid in thin undressed blocks, the mortar being brushed out and kept well back from the surface. The roof is covered with quick weathering tiles, made by Messrs. BARDELL, of Lynn, and considerable projection is given to eaves and gables. This is an attempt to revert to the traditional method of building in the district, now almost entirely superseded, popular taste being apparently best pleased by cold-looking slate roofs innocent of eaves, and walls dressed as smooth as the nature of the stone will permit them to be. Mr. WILLIAM SOUTHGATE, late of Hunstanton, was the contractor, and Mr. HERBERT IBBERTSON, of 5 Adelaide Place, London Bridge, was the architect.

A TITLE PAGE.

THE drawing which has been reproduced in this illustration was exhibited this year at the Royal Academy. In style it recalls some Renaissance examples. The designer is Mr. E. H. TURNER.

OLD GATEWAY, SAN REMO.

THE illustration is taken from a drawing by Mr. W. THOMSON, which was in the exhibition of the Royal Academy.

GARDEN ENTRANCE.

THE original drawing was prepared by Mr. R. W. BEDINGFIELD, of Leicester, and was among those in the Architectural Room of the Royal Academy.

THE LIVERPOOL AUTUMN EXHIBITION.

THE twenty-fourth autumn exhibition of modern pictures held under the auspices of the Liverpool Corporation is now open in the Walker Art Gallery. There are 1,367 oil-paintings, water-colour drawings, etchings and pieces of sculpture, as against 1,242 last year, the increased accommodation being provided by hanging a little higher. The Royal Academicians represented include the President, G. F. Watts, F. Goodall, W. P. Frith, T. Sidney Cooper, L. Alma-Tadema, T. Brock, J. B. Burgess, Sir J. E. Millais, J. Macwhirter, Henry Moore, J. Pettie, C. Val Prinsep, W. W. Ouless, James Sant, Briton Riviere, W. F. Yeames, W. L. Wyllie, W. H. Thornycroft and H. T. Wells; while the A.R.A.s with pictures in the exhibition comprise A. C. Gow, F. Bramley, R. W. Macbeth, David Murray, G. H. Boughton, J. S. Sargent, J. W. Waterhouse, A. Stanhope Forbes, E. Onslow Ford, G. J. Frampton, A. Hacker and W. B. Richmond.

Mr. Wyke Bayliss, P.R.B.A., one of the hangers, has been interviewed by a representative of the *Liverpool Courier*, and gave the following replies:—"I don't quite know what to say about Liverpool art. I have been so busy choosing and hanging pictures that there has scarcely been time to inquire who has painted this or that. I know Mr. Fowler, and much admire his fertile imagination. I know, too, Mr. Follen Bishop, Mr. Talbot Kelly and Mr. Brockbank, for they are members of the R.B.A. Putting aside men of long standing, such as Carl Haag, Birket Foster, &c., I think that in the work of my three young friends you have the very choicest examples of the delicacy of atmospheric effect, with lovely composition and exquisite workmanship." Mr. Bayliss here selected Mr. Bishop's principal water-colour drawing, and illustrated at length its fine qualities, drawing attention to the subtle charms of composition, of sound landscape anatomy, and all the other factors which make a finished picture by a competent and conscientious artist a thing which to possess is an enduring joy.

By way of contrast he turned to a similar and apparently attractive composition by another well known artist, and laid bare faults which betrayed the painter's sad lack of knowledge or conscientiousness. Our representative suggested that this other artist's inferiority to Mr. Bishop was due to his not having the advantage of being a Liverpool man, but Mr. Bayliss waved such an idea aside.

"Look, too," he said, "at this drawing by my friend and fellow-labourer, Mr. Richard Hartley. I see" (looking round) "he is not within hearing, so I may say without hesitation that this is a work worthy of being placed among the best pictures of the land. Still, I can't pretend to a complete knowledge of Liverpool artists such as would enable me to pronounce a generalised opinion with confidence. Your painters seem to be particularly strong in aquarelle, and to carry their work very far. I don't find that there is any marked characteristic such as one recognises in Newlyn or Glasgow—you are less ambitious. Apart from Mr. Fowler you don't seem to produce much that is notable in the way of imagination. Such pictures as that, for example," added Mr. Bayliss, pointing to a large work which occupies the principal centre in the large water-colour room.

"I am afraid," said our representative, "that your illustration rather spoils your argument, for that picture is by a young Liverpool artist."

"I am glad to be so corrected," said Mr. Bayliss. "I consider it comes first among the works of imagination in water-colour, which is all the more praiseworthy as the water-colour section of the exhibition is remarkably strong. But, you see, you must not ask me to be dogmatic about Liverpool art. In fact, the question of locality does not greatly interest me. All true art is cosmopolitan, and what is interesting in an artist, as in a letter, is not the address, but the contents. I may say, however, I have noticed that you have some very capable portrait painters. There are two portraits of elderly ladies in the Grosvenor Room which I admire very much."

"You seem to approve of works of imagination, of so-called literary pictures, Mr. Bayliss. The dogmatists of the Artists' Club won't hear of such things. 'Put an idea into your picture,' say they, 'and it is ruined.'"

"That is all nonsense—why should we not bring literature into art? I say, bring everything into art. Art is a Kosmos, and should receive brain, passion, heart, judgment, knowledge, taste, courage, physical power, craftsmanship, poetry—everything of which heart and soul and body is made. Without, a picture is nothing—mere paint and canvas. Look at this picture of *The Finding of St. George*, by Mr. Gere, for instance." (We had passed into the oil-colour section.) "It is of very high quality, both in treatment and technique; but what distinguishes it chiefly is that it is highly poetical in conception. It is strongly reminiscent in style of Mr. Holman Hunt; in fact, it looks like a pre-Raphaelite work, done, not in the studio, but direct from nature."

"By the way," continued Mr. Bayliss, "while we are at this end of the galleries I want you to look at what I consider the strongest piece of craftsmanship in the exhibition. This picture, by Mr. Gordon, stands almost alone in splendour of technique. In what does the splendour consist? Why, because its workmanship is the farthest from fumbling, because of the magisterial adaptation of means to the end, because in it is the best brush-work—that is to say, the best possible touch put in the right place, with absolute knowledge."

"But let us go to what you call the Grosvenor Room. I want you to look at the splendid picture by our great Watts. It is one which can only be understood fully by those who know his great series illustrating the transition from chaos through evolution, giving the painter's idea of the record of Creation, as if it were another chapter of the Book of Genesis."

"Now, consider the picture as colour. It is a custom in heraldry for common people to have their coats of arms painted; nobles have theirs executed in metal; those of kings are made in jewels; of emperors by the constellations. Now, it seems to me that this old heraldic tradition applies to painting. Some artists paint with paint—you look at the picture and the pigment clamours for notice. Some, again, paint with precious materials. If, after you have looked at Mr. Watts's picture, one were to ask you, 'What blue is in the sky?' you would instinctively reply, 'Lapis lazuli.' It is not always so," added Mr. Bayliss with a significant glance aside, "sometimes it is Reckitt's."

"Leaving the jewel-like wonder of colour, let us consider the conception. A comparison will help us. Mrs. Normand's *Venus* is a goddess, not a woman. Mr. Draper's is a sea-nymph, not a woman. Yet both of them are more like woman than Mr. Watts's, which is yet entitled, *She shall be called Woman*. I take that to be the meaning of the abstract in art. Mrs. Normand's goddess would pass as a surpassingly beautiful woman if she appeared in muslin in a ball-room; Mr. Draper's creation might also if she were educated, but Mr. Hunt's is too typical to become an individual. It is a type, and not even a physical type."

"How charming," continued Mr. Bayliss, "Mrs. Normand's picture is, and how well it illustrates the difference between a man's idea of female beauty and a woman's. I admire greatly Mr. Draper's work which, though so strong, is still extremely subtle—subtle not only in form (it is splendidly drawn and modelled), but in colour and in tone. How subtle also the thought and design. For instance, the nymph is caught in a net, but you see she is not the only one who is caught—he, the lover, you see it in his face. Note again—all the strong men are stretching out their hands, some pointing, some working; his hands, too, are outstretched, but see how one of them is clasped back on his breast, where the wound lies. It is beautiful to note that, whether intentionally or not, Mr. Draper has lifted him out of the group of men by a perceptible difference in delicacy of complexion, marking his youth and creating physical sympathy between him and the maiden. The picture is infinitely richer and more valuable because of the literary suggestion it contains. As I said before, nothing good is amiss in art—put all in.

"Now let us look at these three landscapes by Mr. Terrick Williams, Mr. Julius Ollsen and Mr. Priestman. These three represent the forward movement in art in its best aspect. Their subjects are respectively sunlight, moonlight, mist. Alike they are free from eccentricity, but utterly daring, and in each case choosing some kind of beauty as its desire. They have no relation to that strange craze in art whose aim seems to be the apotheosis of ugliness. Beauty is the centre round which these creations have been evolved by hands possessed of full power of technique."

"What do you think of the exhibition as a whole, and do you consider that exhibitions of this kind are for the good of art?"

"I think it a very fine exhibition," said Mr. Bayliss, "very fine indeed; and I have been much struck by your permanent collection, which seems to have been formed on quite the right lines. You seem so often to have contrived to buy a painter's work just when he was at his best. No one who has been in the gallery could fail in talking of it to say, 'Have you seen Hunt's *Triumph of the Innocents*?' and it would be impossible to improve on the examples of, say, Mr. Yeames, Mr. Yeend King, Mr. Solomon Rossetti—to name the first few that occur—and your Segantini, certainly the finest thing of his seen in this country, shows his best characteristics in excess, especially his sense of the preciousness of material. He is one of the painters who do not paint paint, and so, too, is Mr. Hornel, who is certainly among the lapis lazuli painters. You understand what I mean? Yes, I certainly accept the Glasgow school—even Mr. Hornel—and I look for great things in that quarter.

"I won't say, beyond what I have already said, anything as to what I consider the best picture in the exhibition, and my function here precludes my indicating which I think the worst. The level of quality seems high, and the very bad among the rejected were certainly not over the average in number. Of course there are always a few terrors in every exhibition which serve as occasional refreshment to jaded hangers, but I would prefer not to describe them.

"You asked if such exhibitions do good," added Mr. Bayliss, looking at his watch. "Certainly they do. But dealers detest them, you say. Certainly, that is the best proof. They do good because they furnish to the public some guide as to what artists (who are the only competent judges) think of pictures. The hanging cannot be absolutely just; time would not allow of altering and altering again till the thing was perfect; but an exhibition such as this represents a severe, though rough, attempt to place the best pictures in the best places."

"You say," said our representative, "that artists are the only competent judges of pictures. We critics hold the reverse, namely, that artists are seldom capable of catholic judgment."

"We had better each abide by his own opinion," rejoined Mr. Bayliss; "only pray accept my apology for mine."

"Why is it good that the public should know what artists think of pictures? Because what the artists think to-day the amateur will think to-morrow, and the general public next day. It must be interesting to know what you are going to think."

"But pray, Mr. Bayliss, how does this fit in with the fact that the Royal Academicians, those high-priests who serve in the choir of your artistic cathedral, would have nothing to do with the pre-Raphaelites until the amateur had discovered them, until even the stupid public had begun to see there was something in the new idea?"

"Ah, that is a hard charge to answer," said Mr. Bayliss thoughtfully, looking as if some one had just called "check," "but I don't think that could happen now. Men were not so tolerant then. The art sin of this age, whatever it may be, is not narrowness. Indeed, the tendency now seems rather like the seeking after and being content with eccentricity, simply because it is eccentric. It is, I suppose, a revolt against feebleness, which, after all, is in any form the poorest, meanest thing of all in art."

ARCHITECTURE AND LITERATURE.*

WHILE every other art is living and progressive, architecture is by common consent stationary, if it be not actually retrograde. In every other art the artists have their eyes on the future. They do not doubt that the greatest achievements of their arts are before them and not behind—"That which they have done but earnest of the things that they shall do."

In architecture alone men look back upon the masterpieces of the past not as points of departure but as ultimate attainments, content, for their own part, if by recombining the elements and reproducing the forms of these monuments they can win from an esoteric circle of archæologists the praise of producing some reflex of their impressiveness. This process has gone so far that architects have expected and received praise for erecting for modern purposes literal copies of ancient buildings, or where the materials for exact reproduction were wanting, of ingenious restorations of those buildings. In architecture alone does an archæological study pass for a work of art. The literature of every modern nation is an express image of the mind and spirit of the nation. The architecture of every modern nation, like the dress of every modern nation, is coming more and more to lose its distinctiveness and to reflect the fashion of Paris. It was not always so. The architecture of Greece and Rome tells us as much as antique literature tells of Greek and Roman life. Mediæval architecture tells us so much more of Mediæval life than all other documents of that life that they become insignificant in the comparison, and that from their monuments alone the modern man can succeed in penetrating into the spirit of the Middle Ages. Nay, in our own time the architecture of every country outside the pale of European civilisation is a perfectly adequate and a perfectly accurate reflex of the life of that country.

I have spoken of the analogy between architecture and literature. It seems to me that it is not fantastic, and that if we follow it it may lead us to a comprehension of the very different state of the two arts to-day. Nobody pretends that modern literature is not an exact reflex of modern civilisation. If we find fault with the condition of it in any country we are not regarding it as a separate product which could be improved by the introduction of different methods. We are simply arraigning the civilisation of the country, thus completely expressed. If we find one literature pedantic, another frivolous and another dull, we without hesitation impute these defects as the results of national traits. The notion that any modern literature is not a complete expression of the national life no more occurs to us than the notion that any modern architecture is such an expression.

Now modern architecture, like modern literature, had its origin in the revival of learning. The Italian Renaissance in architecture was inextricably connected with that awakening of the human spirit which was the beginning of modern civilisation. It is not that Classic models have been discarded or neglected in the one art and retained in the other, for down to our own generation at least a liberal education, a literary education, has been a classical education. Whatever the baccalaureate degree is coming to mean now, for several centuries it has meant a knowledge of the masterpieces of Greek and Roman letters, as the education of an architect has during the same time implied a knowledge of the masterpieces of Greek and Roman building. A main difference has been that in literature the classical models have been used, and in architecture they have been copied. If writers had hesitated, even while Latin was the universal language in Europe, to use locutions "that would have made Quintilian stare and gasp," it seems to me quite certain that there could have been no literary progress, while it seems to be almost a tenet of the architectural schools, and at any rate it is a fair deduction from modern academic architecture, that no architectural progress is possible. There, alone in the work of mankind, the great works of the past are not alone useful for doctrine, for reproof, for correction, for instruction, are not even models in the sense in which we use the word in reference to other arts, but are "orders" to be carried out as literally as the conditions will allow, are fetiches to be ignorantly worshipped and invested with mysterious powers.

At the time of the revival of learning the purists were as strenuous in literature as they are even yet in architecture, and for a time as prevailing. The literary classics were to them what the architectural classics still are to the practitioners of official architecture, and the vocabulary of the ancients as sacred a repertory of words as the orders of the ancients a repertory of forms, to which nothing could be added without offence. To them it was not requisite that a writer should express his mind fully; it was not even necessary that he should have anything to say, but it was necessary that his

* From the Butterfield Lecture delivered at Union College, Schenectady, New York, by Mr. Montgomery Schuyler, and published in the *Architectural Record*.

Latinity should be unimpeachable. So long and so far as it was enforced, the restriction to the ancient vocabulary had as deadening an effect upon literature as the like restriction still has upon architecture. Lord Bacon has given an excellent account in a few sentences of the consequence of this "more exquisite travail in the languages original" upon the progress of literature and the advancement of learning. "Men began to hunt more after words than matter; more after the choiceness of the phrase and the round and clean composition of the sentence, and the sweet falling of the clauses . . . than after the weight of matter, worth of subject, soundness of argument, life of invention, or depth of judgment." The literary purists of the Renaissance were inevitably impatient of men who were preoccupied with what they had to say rather than with their way of saying it, and were especially incensed against the school philosophers "whose writings," to quote Bacon again, "were altogether in a different style and form, taking liberty to coin and frame new terms of art to express their own sense, and to avoid circuit of speech, without regard to the pureness, pleasantness, and, as I may call it, lawfulness of the phrase or word." Substitute "form" for "phrase or word," and you have here an exact statement of the respective positions of the progressive architect, and of the architectural purist, and of the reason why it is out of the question that architecture should advance when the teaching and the practice and the judgment of it are confided to the architectural purists.

In literature the restriction did not last long. If it could have lasted it would have arrested the literature and the civilisation of Europe, for a demand that nothing should be expressed in new words was in effect a demand that nothing new should be expressed. Such a restriction, when the human spirit had once been aroused, it could not accept. The instinct of self-preservation forbade its acceptance. Men who had something to say insisted upon saying it, saying it at first in barbarous Latin, to the pain of the purists who had nothing to say and did not see why anybody else should have anything to say that could not be expressed in the classical vocabulary; saying it afterwards in "the noble vulgar speech" which at first, and until it had been developed and chastened and refined by literary use, seemed cruder and more barbarous still. The progress of mankind being at stake, the purists in literature were overwhelmed. Only the progress of architecture being at stake in the other case, the purists have prevailed and architecture has been sacrificed with only local and sporadic revolts, and these for the most part within our own century, in place of the literary revolution that was triumphantly accomplished four centuries ago.

It was not accomplished without a struggle. The "more exquisite travail in the languages original," when there was no other but classical literature, had induced in scholars the belief that the masterpieces of that literature would never be equalled. It is, I believe, still questioned by scholars whether the Classic masterpieces have been equalled even yet, while it is the opinion of scholars that the languages in which they were composed are still the most perfect orders of speech that have existed. It was natural, then, that men who had nothing in particular to say, or at any rate felt no urgent need of expressing themselves, should have deemed that Classic literature was complete as well as impeccable, and that its limitations could not be transcended. Fortunately for us all, there were other men who felt, with Browning, that—

It were better youth
Should strive, through acts uncouth,
Toward making, than repose on aught found made,

and these men were the greatest scholars as well as the greatest thinkers of the age. Politian, of whom it has been said by a critic of our own time that he "showed how the taste and learning of the classical scholar could be grafted on the stock of the vernacular," ridiculed the purists in better Latin than their own. "Unless the book is at hand from which they copy," he said, "they cannot put three words together. I entreat you not to be fettered by that superstition. As nobody can run who is intent upon putting his feet in the footsteps of another, so nobody can write well who does not dare to depart from what is already written." And while the Italian scholar was deriding the Italian pedants, the Dutch scholar, who did not even look forward to a time when the vernacular should supplant Latin, yet protested against the imposition of Classic forms as shackles upon modern thought. "Hereafter," said Erasmus, "we must not call bishops reverend fathers, nor date our letters from the birth of Christ, because Cicero never did so. What could be more senseless, when the whole age is new, religion, government, culture, manners, than not to dare to speak otherwise than Cicero spoke. If Cicero himself should come to life, he would laugh at this race of Ciceronians."

It would be as presumptuous in me as it is far from my intention to disparage academic training, in architecture or in literature. The men who have done most towards building up these great literatures, that are at once the records and the

trophies of modern civilisation, have for the most part been classical scholars, and classical scholarship stood them in particularly good stead when they worked in the vernacular, especially during the formative periods of these literatures, when there were as yet no standards or models but those of antiquity. Perhaps what seems to us the most autochthonous of our literature owed more to this culture than we are apt to suppose. "I always said," Dr. Johnson observes, "that Shakespeare had enough Latin to grammaticise his English." These writers derived from their classical studies a literary tact that could have been imparted so well in no other way. Certainly the same thing is true of the classically trained architects. Whether they are working in the official style that has been the language of their schools, or have attempted the idiomatic and vernacular treatment of more extended and varied methods of construction than the very simple construction of Greece, which was expressed with consummate art, and the more ambitious and complicated construction of the Romans, which yet is simple compared with our modern constructions, and which cannot be said to have attained its artistic expression; in either case there is equally in their work this tact, this measure and propriety that bespeak professional training. It is not the training that I am deprecating, but the resting in the training as not a preparation but an attainment. There is another pregnant saying of Bacon that would well recur to us when we see the attempt to meet modern requirements without departing from antique forms, and to carry out academic exercises in Classic architecture into actual buildings:—"Studies teach not their own use, but that is a wisdom without them and above them, won by observation." It is as if an educated man in our day should confine his literary efforts to Latin composition. Very curious and admirable essays have been made even in modern Latin and even in our own time. To see how near one can come to expressing modern ideas in classical language is an interesting and useful exercise, by the very force of the extreme difficulty of even suggesting them and the impossibility of really expressing them. When the modern Latinist has finished this circuitous and approximative progress he has produced what—a poem? No, but only an ingenious toy for the amusement of scholars—a "Classic design." If he devoted his whole literary life to the production of such things we should be entitled to pronounce decisively that he had nothing to say, or he would take the most direct way of saying it. It would be evident that he was preoccupied with the expression and not with the thing to be expressed, not with the idea but "with the pureness, pleasantness and, as I may call it, lawfulness of the phrase or word."

A living and progressive Classic poetry in our day we all perceive to be merely a contradiction in terms. Classicism is the exclusion of life and progress, and a living and progressive Classic architecture is, in fact, equally a contradiction in terms. Forms are the language of the art of building, and architectural forms are the results and the expression of construction. This is true of the architecture of the world before the Renaissance, excepting the Roman imitations of Greek architecture. It is true even now of the architecture of all that part of the world which lies outside the pale of European civilisation. It is only since the Renaissance and in Europe and America that Classic forms have been used as an envelope of constructions not Classic, and that the attempt to develop building into architecture has been abandoned in favour of the attempt to cover and conceal building with architecture. This attempt is beset with difficulties by reason of the modern requirements that cannot be concealed. I have heard of a Classic architect saying that it was impossible to do good work nowadays on account of the windows. This is an extreme instance, doubtless, but the practitioner of Classic architecture must often be as much annoyed by the intrusion of his building into his design, and the impossibility of ignoring or of keeping it out altogether, as the modern Latin poet by the number of things of which the Classic authors never heard that he has to find words for out of the Classic authors. The versifier does not venture to complain in public, because everybody would laugh at him and ask him why he did not write English. But the Classic architect is not afraid to make his moan, and to complain of the intractability of modern architectural problems, or to excuse himself from attempting a solution of them upon the ground that they do not fit the Classic forms. He is not likely to find sympathy in his complaint of the oppressiveness of shackles which, in this country at least, he has voluntarily assumed. Why should we not laugh at him also? He, too, may be recommended to write English, which in his case means to give the most direct expression possible to his construction in his forms, and to use his training to make this expression forcible, "elegant" and scholarly; poetical if the gods have made him poetical; at any rate, "to grammaticise his English" instead of confining himself to an expression that is avowedly indirect, circuitous, conventional and Classic—a polite "language" like the Latin of modern versifiers. "Si revivisceret ipse Cicero, rideret hoc Ciceronianorum genus."

The repertory of the architectural forms of the past is the vocabulary of the architect. But there is this difference between his vocabulary and that of the poet, that a word is a conventional symbol, while a true architectural form is the direct expression of a mechanical fact. Any structural arrangement is susceptible, we must believe, of an artistic and effective expression. Historical architecture contains precedents, to be acquainted with which is a part of professional education, for many if not for most of the constructions commonly used in modern building. But Classic architecture does not contain them. The Greek construction is the simplest possible. The more complicated Roman construction was not artistically developed and expressed by the Romans themselves, and the literary revivalists of Classic architecture of the fifteenth century restricted themselves and their successors to the Roman expression without very clearly understanding what it was. They were more royalist than the king, more Ciceronian than Cicero. If we are to accept the statement of Viollet-le-Duc, Vitruvius himself, if he had submitted his own design, as he describes it, for the basilica of Fano, in a competition of the Ecole des Beaux-Arts at the beginning of this century, would have been ruled out of the competition for his ignorance of Roman architecture. But, in any case, the classical building embraces but a small part of the range of constructions that are available to the modern builder. To confine one's self to Classic forms means, therefore, to ignore and reject, or else to cloak and dissemble, the constructions of which the Classic builders were ignorant, or which they left undeveloped, to be developed by the barbarians.

And here comes in another restricting tenet of the schools, that you must not confuse historical styles. No matter how complete an expression of an applicable construction may have been attained, if it does not come within the limits of the historic style that you have proposed to yourself, it is inadmissible. This is not a tenet of the official schools exclusively. It is imposed wherever architecture is practised archaeologically. In the early days of the Gothic revival in England, Gothic building was divided and classified more or less arbitrarily, and it would fatally have discredited an architect to mix Early English and Middle Pointed, or to introduce any detail for which he had not historical precedent, and this without regard to the artistic success of his work, but only to its historical accuracy. It was not until the architects of the revival outgrew this superstition that their work had much other than an archaeological interest. Any arbitrary restriction upon the freedom of the artist is a hindrance to the life and progress of his art. While it is no doubt more difficult to attain unity by the use of constructions that have been employed and expressed in different ages and countries than by renouncing all but such as have been employed together before, and have been analysed and classified in the schools, the artist is entitled to be judged by the success of his attempts and not to be prevented from making them.

THE PLANNING OF HOSPITALS.*

ONE cannot speak properly of the planning of hospitals without including much that does not strictly belong to the province of the student of architecture. You will pardon me, therefore, if I open these remarks with statements and explanations bearing upon the subject which are derived from such medical authorities in hospital science as are well known to fame in this connection.

What follows is not said to undervalue the work which has been done by the medical specialists, but to awaken thought in a new direction for the benefit of our own profession, to whom the business of designing all kinds of buildings legitimately belongs.

One of the objects of this lecture is to suggest to the young minds before me the possibility of an improvement in hospital building, which would spring up if the architect should so fit himself by early and careful training for the special work of designing and constructing hospitals. Granted that a hospital is a machine, if you will, it seems reasonable that it may be and ought to be an agreeable looking machine, and there is nothing in nature or art to prevent the architect from understanding and producing it.

Whether working with a specialist, or as a specialist, it becomes the architect, who must remain the authorised interpreter to the workmen of all drawings and specifications, to know the value of and the reason for every line and every word that they contain. Furthermore, he is often called upon to be accountable, and sometimes the accounting head, in carrying on the works. Over and above all these points, he has the artist's responsibility in the case, to give the building or group of buildings whatever of artistic character may be possible, or

under the most unfavourable circumstances to see that the result shall not develop as a blot or an eyesore.

The history of hospitals up to recent times is rather mythical; Egypt, India, Greece and Rome are all said to have had something of the kind. While the subject is one of great interest, there is too much of uncertainty and mere conjecture surrounding it to yield much profit to the general student.

Hospital.

The English word "hospital" has been and still is used in a double sense, viz. "As a place of medical treatment, and also as a retreat for the poor, the infirm, &c."—"Encyclopædia Britannica." Burdett in his great book uses two terms; the title is "Hospitals and Asylums of the World."

The late Dr. Kirkbride deviated from the English nomenclature with regard to establishments for the care of the insane; these in England are usually called "asylums." Following Dr. Kirkbride, the term "Hospital for the Insane" is generally used in this country to indicate that the institution is for the purpose of treatment of insanity as a disease with a view to its cure, and not as a mere shelter for its inmates.

What I have now in mind to speak of more particularly is the hospital for the treatment of the sick and wounded.

Originally the word hospital meant, as the word asylum now means, a place of shelter for the poor and helpless only; now it has the included meaning of treatment and restoration. The inmate of an asylum may or may not be a patient, the inmate of a hospital proper is always a patient, and the rich as well as the poor avail themselves of the benefits of hospital treatment. There is good reason to believe that in many cases, especially those of a surgical character, a well-organised hospital possesses great advantages over the best equipped private house. All difficult and dangerous operations can be there performed under conditions more favourable than at home. So that the hospital manager, the doctor and the architect must work together to improve this life-saving and life-lengthening apparatus, and the best equipped man for the work ought to be the architect.

Hôtel Dieu.

It is only within comparatively recent years that scientific progress has been made in the organisation of hospital management and the construction of hospital buildings. France appears to have taken the lead, but England and America are now well abreast, if not ahead. The old Hôtel Dieu at times during the last century held five thousand patients. As many as six people were laid in one bed. The buildings occupied only a little over three English acres, so that each inmate of this "house of God" was allotted only about thirty square feet of the earth's surface whereon to live and breathe. You will better appreciate the extent of this crowding when told that each inhabitant of the city of Paris has 430 square feet, and of the city of London about double this area, or over 800 square feet. There is some satisfaction in knowing that the present Hôtel Dieu gives each patient 311 square feet, although this is a very short allowance according to the present advanced idea of the proper ratio.

The earliest record of hospital building in England states that in the eleventh century two were founded by the Archbishop of Canterbury, Lanfranc by name.

About fifty important hospitals were founded in England, Ireland and Scotland during the eighteenth century, which shows a wonderful movement in the intentions of benevolence. The earliest hospital in North America is the Hôtel du Précieux Sang, built in 1638, and the next in order of time the Pennsylvania Hospital in Philadelphia, the east wing of which was built in 1755.

Before the Revolution of 1789 the French had begun to devise special plans, but that terrible event intervened, and no tangible improvement grew out of their thought and invention until the La Riboissière was begun in the reign of Louis Philippe. Singularly enough, the Revolution of 1848 interfered with the building of that, and it was not completed until the year 1854.

The Episcopal Hospital.

When the Episcopal Hospital in Philadelphia was designed in 1859, the La Riboissière was considered by its projectors as the best existing model to be followed. I may say it was not strictly followed, but in all essential features it is probably the best hospital building which was erected at or before that period. Its benefits came into full play in our Civil War.

The Johns Hopkins.

The plans of Johns Hopkins Hospital in Baltimore, recently published by Dr. Billings, illustrate more fully than any other yet built the thorough study of the subject which is being given in modern times. It is in effect, from the medical point of view, an ideal hospital. No thought, time, trouble or expense was spared to make it so; to carry into practice the most advanced ideas of hospital design and construction. I shall refer to this frequently as it is a convenient landmark and object lesson. There can be no objection to doing so, as the plans

* A lecture delivered before the Architectural Department of the University of Pennsylvania, by Mr. Addison Hutton, architect.

by their publication have become common property. If a copy of Dr. Billings's book is not already in your library, it ought to be placed there.

In the Johns Hopkins Hospital, beyond the administration and pay wards, it is difficult to discover the touch of the artist. Architecture as an art seems to have been subordinated to the demands of hospital science, and any thought of architectural beauty in the treatment of the external appearance of the common wards, particularly ignored. I wish to suggest the point that there are no compelling requisites of size, proportion or detail in hospital plans that may not be softened and rounded by artistic care, so as to give token of regard for beauty.

Passing by the collateral needs, all of which enter into the planning of hospitals, such as the departments for administration, for clinical teaching, for training of nurses, for out-patient service, for isolating purposes, for the pathological work, for cooking and washing, our present business will be with the arrangement and construction of a proper hospital ward, with its inseparable adjuncts.

Terms.

A room furnished with a bed or beds to receive patients is called a ward. For many reasons it has been found satisfactory within economic limits to place from ten to thirty patients in one room, and this room is called the main ward, and if the hospital contains more than one, they are numbered 1, 2, 3, &c. They are also spoken of by the attending physicians and nurses as medical wards, surgical ward, &c., according to the use. But it is not necessary to make this distinction in connection with planning. The needs of a surgical ward are the most exacting; if we plan properly for that we shall cover the ground for all requirements, except for cases where special isolation is required. In the Massachusetts General the Bradlee Ward is designed on isolating principles, a special ward for abdominal and cerebral cases.

But I wish to confine your attention just now to that unit of a hospital which is, or should be in emergency, a complete hospital in itself and is called, for convenience, a pavilion. This consists of two parts, the main ward and the head-house, as well separated from each other as the nature of their relations will permit. Under certain regulations it is now conceded that another ward and head-house may be superimposed, making a two-storey pavilion. There has been much discussion as to the advantages and disadvantages of two-storey building pavilions. There was a period when the authorities told us that the one-storey only could be the proper thing. The Johns Hopkins built some of each, and, it may be supposed, is now making a record of comparative results.

Area.

We will consider now the main ward. Its floor area should have a minimum of 100 square feet per bed, and it is believed that no ward ought to have over thirty beds. If we fix the clear height at 12 feet, which is probably the minimum that should be allowed, we have 1,200 cubic feet per patient. That is a fair standard of practice in the climate of Philadelphia, provided reasonable attention is given to the means of winter ventilation. The glass surface for the windows should not vary much from 20 square feet per patient, although this may be considerably decreased in more northern latitudes and on stormy exposures.

Form.

The usual form of the ward is an oblong parallelogram of about 25 feet in width; this is enough when 8 feet length per bed is allowed. Some have been made of greater width; the Johns Hopkins wards are 28 feet wide, with 7 feet wall length per bed. The wards in the Episcopal Hospital are, I believe, fully 30 feet wide in the clear, but this width in a long ward is now considered excessive.

Some of the modern English hospitals have very pretty circular wards with ventilating stacks in the middle, and it is a matter of some surprise that octagonal wards, such as one built in the Johns Hopkins, have not been more usually adopted. In the Massachusetts General, built in or about 1820, the wards are nearly equal sided, with a great chimney-stack in the middle. A modification of this, except that the sides are extended and the corners are cut away to form an irregular octagon, may be seen in the new wards of the Pennsylvania Hospital.

These wider wards with the central chimney, whether square, round or octagonal, present some marked advantages in the matter of ventilation, and are especially desirable when there is a superimposed ward. Later on I hope to recur to this.

Site and Orientation.

In choosing a hospital site, the quality of the soil, the facility of water-supply and drainage should be carefully attended to. But an important care and duty of the architect is to regulate the orientation of the wards. These invariably ought to be placed on the south side of the connecting corridor, and, when oblong, should have the axis as nearly on the meridian as possible.

Thus every day of the year in which the sun shines, at least three walls of a rectangular ward will be bathed in sunshine. This is good for the patients, good for the building, good for warmth and good for ventilation.

Spacing of Wards.

With the orientation just described, the interval between wards may be smaller than in any other. Thus, if a one-storey ward be 14 feet from the first floor to the eaves, the space between wards may be 28 feet; if there is a superimposed ward, this interval should be much greater.

Head-House.

As the ward is the essential part of the hospital, it has claimed our attention thus far. But food, clothing, water and drainage are important and must be available in a hospital as elsewhere. A section of the pavilion is isolated as nearly as possible from the ward by the cross-corridor, through which, as often and as long as possible, fresh outside air is allowed to pass. On the north side of the corridor, supposing the orientation to be regular, is placed the head-house containing the numerous adjuncts which go to make each pavilion a complete hospital in itself.

Here are placed the stairs, the service-room through which is served all food (which comes, in a large hospital, from a remote kitchen, by way of the basement corridor), the clothing-room, the linen-room, the nurses' duty-room, the bath-room, the water-closets, and if practicable, one or more special rooms or wards for single beds.

Ventilation.

All the water fixtures are arranged for special artificial ventilation separate from the ward ventilation. Keep fairly in mind that the governing thought, difficult to put into execution in our climate, is primarily to isolate the ward by means of air currents from the head-house and each pavilion from its neighbours as much as possible, and that inside of the head-house (or outside of it, as you may sometimes find it necessary) the drainage fixtures must be further isolated by a well-formed air-passage flushed as frequently and as much as possible with fresh external air. Another help in natural ventilation is the peculiar window which has a transom at 2 feet from the top, the sash of which is hinged at bottom to open inward to admit fresh air at the top, which is thus admitted and impelled in mild weather into the room toward the ceiling without danger of too much draught on the patient.

You may find under some conditions that it will be necessary to control the ventilation, especially in winter, by fan pressure, but this should not happen in a new enterprise where the conditions of the selection of site and orientation can be controlled or regulated. But you will be called sometimes to enlarge, alter or extend existing hospitals, and you will then be glad to draw on all resources within your reach.

Aspirating Flue.

It will generally be found best to construct a large single ventilating flue for each ward, with openings into it at floor and ceiling. This is rendered active by a coil of pipe heated with steam all the year round. Such a flue cannot be placed within the lines of the long narrow ward, but may be placed in the head-house or lobby, as in the Johns Hopkins. It involves long ducts both under and over the ward, and places a serious difficulty in the way of a second-storey ward. Owing to the great length of the horizontal ducts and branches it would seem that the effective draught would differ much between the near and distant parts of the ward.

In the wider ward having a central stack such as the octagonal wards of the Johns Hopkins, the square wards of the Massachusetts General and the wide Memorial wards of the Pennsylvania, the central ventilating-stack will undoubtedly perform more thorough work in a more economical manner. The steam-pipes and coils are made accessible by means of a ladder from the basement to the attic.

A separate flue of the same description, in which steam, water and drain pipes are placed, ventilates the water-closets; the other parts of the head-house are ventilated by flues, collected into a separate common head, having steam coils like the rest.

Warming.

Volumes have been written on warming in connection with the subject of ventilation. Merchants, manufacturers, doctors, lawyers and engineers from time to time have burdened the world with new books. It is nearly safe to say that nobody in a northern climate has ever been thoroughly and continuously satisfied with his warming apparatus. So I will not startle you by saying that such a hospital or such a house has a thoroughly satisfactory apparatus. What is to be brought forth hereafter in electrical invention no one can safely predict; nothing yet has appeared to supersede the appliances through which steam for fifty or sixty years past has been found clumsily effective.

At the Johns Hopkins both steam and hot-water appliances are put in. This has been to solve experimentally the question

as to which is better. In the other hospitals within my knowledge steam alone is applied.

Almost invariably cast-iron radiators, which now largely take the place of the pipe coils, are placed in the basement at the bottom of the hot-air flues. Fresh air brought from the outside at least 6 feet from the ground passes over these radiators, and becoming warmed is discharged through metal-lined flues into the ward or wards above. The area of these flues is reckoned for this latitude at about 100 square inches per patient, and the area for ventilation by the means already referred to should not be materially different. An important feature in any method of warming is the management of the admitted air. Whether the winter weather be cold or mild, the inflow of air to the ward should be kept as nearly as possible to the same volume.

This is done by a mixing damper, so placed that by a single movement the flow of hot air is diminished, the flow of cold air increased; the two volumes thus thrown together, mixed and tempered, are delivered into the ward. By means of an actuating chain or rod this movement of the damper is performed by the nurse without leaving the ward.

With this tempering arrangement for inflow and proper openings for outflow at floor and ceiling—those at floor are always open, those at ceiling controlled by registers so that the air may be changed and the temperature promptly lowered on occasion—extraordinary care is not required to keep the ward at the proper temperature.

I ought to mention that the inlets for warm air are better placed under the windows; the windows are the coldest points in the room, and as the greatest space between beds is opposite the windows, the danger of draughts on the beds is thus minimised.

Construction.

In speaking of the construction of the hospital I will refer only to such features as are especially important in this class of building. Of course hospital construction in most particulars may be, and usually is, the same as in other buildings of the better class.

The foundations should be laid with stone and cement, and there should be a damp-proof course of asphaltum or slate at the ground-line. In some soils the foundations should be drained with tiles; in those of sand or gravel this is not necessary.

So far as is ascertained there is no better material for walls than brick. All interior partition walls ought to be brick. The weather-barriers should be formed of two 9-inch walls with 2-inch air-space, well bonded at all jambs and corners. An excellent alternative is an 18-inch solid wall with hollow lining of terra-cotta, whereon the wall plaster is laid. Either of these devices will insure dryness of the internal wall surface.

A principle to be followed as carefully as possible in hospital building is to leave as few cavities in the construction as consistent with the conditions of integrity and endurance.

Every surface should be solid and smooth as practicable, and thus easily and freely cleansed and kept clean.

When floors are constructed in the usual manner the intervals between joists may be filled with mineral wool. This helps to deaden sound, leaves no harbour for rodents or any other offensive thing. Still better, where the appropriation of funds will permit it the floor should have beams of iron or steel filled in with bricks; the nailings of the surface floor will thus rest on a bed of iron and burnt clay. Again the mineral wool comes into play between the railings or sleepers. The surface floors must be hard wood; nothing is better than the southern yellow or pitch-pine, which, when cut and dressed to show the edge grain, makes a handsome and most serviceable floor. A good, tight, smooth, well-finished floor is most important; paraffin and soluble glass are recommended as coatings. The joining to the wall is best with a neat wooden core, the usual high wooden bare skirting being omitted. In fact, only such inside woodwork as is absolutely necessary is recommended in the best hospital construction. The window jambs and heads may be rounded or chamfered in plaster, and the window sills rubbed slate.

The floor and parts of the walls of the water-rooms are lined with pottery tiles, and all angles give place to curves, concave or convex.

It is best that stairs shall have iron construction, and if slate-treads come within the appropriation they are to be preferred to wood.

The plastering of the walls and ceilings should have great care bestowed upon it. The surface should be left with what is known as hard-finish, composed of lime, sand and much labour. Where lath are commonly needed, such as on ceilings, &c., stiffened wire netting should be substituted.

At all internal points, and in all materials, whether stone, brick, wood, pottery, plaster or metal, constant attention should be given to the avoidance of open joints, sharp corners, quirks and creases. The exclusion from the interior of the ward of all architectural decoration may be a part of the reason why in

recent times there has been a disposition to exclude the architect himself.

If I have seemed to take up much time in dwelling on what might be called the peculiarities of hospital building, I assure you I have done so with the general purpose of outlining the subject, as it were, by simply touching on some of the details in a way that may attract your attention, with the thought that some of you might in the future take up the designing of hospitals as a specialty. Be assured that the subject is a large one; thousands of volumes have been written upon it; new discoveries in medical and surgical science are modifying the older theories, so that one needs to keep abreast with daily progress. For those who have a certain combination of mechanical with artistic genius, it would certainly prove exceedingly interesting and possibly profitable in fame and money.

The increase of material wealth of the people of this country, the inevitable poverty and suffering which travel on foot alongside of the chariot of wealth, are the two factors which will more and more conduce to the founding of institutions for the charitable care of the sick and suffering. Then as science prospers and proves what it is capable of in healing and minimising pain, the rich and well-to-do will patronise such establishments in which they can be better relieved and cured than in their own homes, and will add liberally to the means of supporting them.

I am the more moved to speak as I do, because some of the medical advisers have strongly intimated their disregard for architectural beauty, as if it were not worth an effort. I plead that the skill of the architect can modify the appearance of almost anything having walls, windows and roof, so as to render it a thing inoffensive, and, with perhaps a slight addition to the expense, a thing of beauty.

M. Tollet, a French writer on hospitals, thinks that the ogival or Gothic form of architecture was adopted in the Middle Ages as much for sanitary as for architectural reasons. Whether he be correct or not (it appears to be a conjecture only), this writer sees no objection to its use, except that it does not seem to lend itself so readily to the rigid conditions imposed by modern sanitary science.

But there is one point worth noting in regard to this. Doctors, for a wonder, do not differ in their recommendations for top ventilation; in one-storey wards this easily becomes what is termed ridge ventilation. In all wards it is very desirable to slope the ceiling upwards from the sides to the middle. So that we have in the ceiling of any ward, especially of the one-storey ward, a hint of Gothic which might well be followed in the external architecture of the building.

If one were requested to design a hospital group in the Gothic style, he should not seriously resist the pressure to do so. It is possible to do it without trespassing on the code of hospital science so far as I know it. One should be allowed and should take much freedom in such an instance; he would be glad, of course, if the state of the treasury would admit of stone as a material for external walls.

But if you ask what type of architecture appears best suited or most adaptable to beautifying the hospital, I am obliged to answer, a modified Renaissance or some derivative of Classic; that is, so far as detail is concerned. There can scarcely be such a thing as perfectly regular or symmetrical handling of the voids and solids, as is necessary to give the best developed results in Renaissance.

You are obliged to submit to certain irregularities of plans and arrangement of openings, because the wants of the interior are dominant, and interfere with the symmetry required in the perfection of the Renaissance.

The combination in the same view of the wards, which are large, with the rooms of the head-house, which are small in plan, but for working reasons must be high in storey, adds to the difficulty of designing a building to show the regular and symmetrical beauties of Renaissance work.

The solution of the question as to what is best can, perhaps, be nearly reached by recognising the difficulty fairly, and approaching it in the most direct way.

In a hospital group there are some parts, notably the administration building and the pay wards, the requirements of which do not suffer by compromise with the demands of external symmetry. These and certain portions of the wards and head-houses may have regularity of design. (It seems unfortunate that the most satisfactory storey heights for sick wards are not sufficient to permit mezzanines in the head-houses.) For the rest, you perforate the walls at such points as you must, and rely on horizontal courses and minor details of the cornices and windows for such effects as will make harmony with the richer parts of the design.

It does not seem good judgment to leave the walls of the wards and head-houses so bare and devoid of architectural interest as those of the Johns Hopkins are, especially as they front and are seen from a beautiful park, and every ward is visible from its neighbour. It seems to me that the patients and nurses should have something more interesting to look at

than naked walls, which might be, for any external sign that they give, those of a warehouse, and chimneys which might be those of a chemical laboratory.

But I must close. I feel that I have only hinted at the thoughts and things which enter into this very interesting sort of building. But if I have awakened in some of you the desire to know more of the subject, I have accomplished all that could be expected within the allotted hour.

I will name three books (I might name ten or twenty; but naming the three, you will have a guide to all the others) in which you can find the book knowledge upon which you can start the structure of your equipment for hospital work:—Burdett's "Hospitals and Asylums of the World," "Encyclopædia Britannica," "The Johns Hopkins Hospital."

The Middle Ages were the cathedral building centuries. The nineteenth century is the era of railroads and high buildings. The twentieth century, with the growing tendency of the strong to help the weak and unfortunate, coupled with the ability to help them, may prove to be the age of scientific healing, and more universal, enlightened, benevolent and charitable work than has ever before been seen in the world. Along with this will undoubtedly grow the love of all beautiful things in nature and art.

I can think of no nobler work for you to engage in, those of you who may feel drawn in this direction, than that of preparing to take a part in bringing about this great consummation. If any of you do, I trust it will be with high aims, and with the feeling that this is something better than a railroad building, shall I say better than the Crusades or cathedral building, or any other demonstration of enthusiastic building that ever took place for the good of man or the glory of God?

Every work that is done, in the spirit that is now abroad, for the amelioration and relief of human pain, is a step towards the millennium. The hospital, which was once a pest-house, and, in a measure, a curse, although founded on the best instinct of humanity, will in the course of the future become without doubt an unmitigated blessing, a veritable Hôtel Dieu, a "house or hostelry of God."

THE BAPTISTERY.

THE word "baptistry" is derived from the Greek word for a large vase, labrum or piscina of the frigidarium. When it was decided to erect baptisteries in which the rite of baptism could be performed on many converts, a site near a church was selected. The form adopted was generally hexagonal, and it is very probable that the form of these buildings was imitated from some apartment in a Roman bath.

The most celebrated existing baptisteries are those of Rome, Florence and Pisa; the most ancient is the baptistry of St. Giovanni in Fonte, near the church of St. Giovanni Laterano, at Rome, commonly said to have been erected by Constantine the Great. The plan of this building is an octagon, with a small portico at the entrance; the interior is decorated with eight most beautiful porphyry columns, the finest of the kind in Rome. These columns, unequal in diameter, support an architrave, over which eight small white marble columns are placed; above this second order there is an attic decorated with pilasters, and this is crowned with a dome. The walls are adorned with frescoes, consisting of subjects from the Gospel and the principal events of the reign of Constantine. In the centre of the building there is an octangular basin, 3 feet deep, lined and paved with marble. A modern font now stands in the centre of this basin, raised on steps of marble. The diameter of this structure is about 75 feet (according to the measurement of Noli), and it appears to have been constructed with the materials of other buildings. Eustace calls this structure a chapel, and informs us that in it "only, and upon the eves of Easter and Pentecost, was public baptism administered in Rome; many magnificent ceremonies, which occupied the whole night, accompanied this solemnity."

The Baptistry of Florence, which is also octangular, with a diameter of about 100 feet, stands opposite to the principal entrance of the cathedral. The date of its first construction is unknown; the Florentines pretend that it was originally a temple to Mars. In the internal arrangement sixteen large granite columns are employed to support a gallery, which is carried nearly all round the interior; the vaulting is decorated with mosaics by Andrea Tafi, the scholar of Cimabue; on the pavement is a large circle of copper, with numerical figures and signs of the zodiac upon it; and in the centre of this stood originally a very fine octagonal basin. The external façades are built of black and white marble, and designed in that peculiar style of Florentine architecture of which Giotto was the father. Possibly this edifice may have been erected after his designs. The three great bronze doors are celebrated for the beauty of their bas-reliefs, and for the marble and bronze figures above them. The valves of the doors are divided into panels, on which are represented the principal events of the

life of St. John, "the cardinal and theological virtues," and subjects from the Old and New Testament; and so important was the subject considered, that learned men were engaged to select subjects for the sculptor. These individuals were Nicolo da Uzzano and Leonardo d'Arezzo. One of these doors was executed as early as 1330, and in after times eulogised by Michel Angelo in the highest style of panegyric. The most celebrated of these doors was made by Lorenzo Ghiberti. Another was made under his direction, assisted by many other artificers. Fifty years were employed in making and completing them. The most ancient was made by Andrea of Pisa.

The Baptistry of Pisa, erected between the years 1152 and 1160, by Diotisalvi, is of a singular design. The plan is circular, with a diameter of 116 feet; the walls are 8 feet thick; the building is raised on three steps and surmounted with a dome in the shape of a pear. The external elevation is divided into three storeys; in the basement the columns, twenty in number, are engaged, and have arches springing from column to column, with a bold cornice above; in the first storey the columns are smaller, stand out in relief, and are placed closer together, and the order is surmounted with pinnacles and high pediments, placed at equal distances: the terminations of these parts are crowned with statues. Above this is an attic storey, decorated with other high pediments, pinnacles and statues. The dome, which is covered with lead, is intersected by long lines of very prominent fretwork; all the lines meet in a little cornice near the top, and terminate in another dome, above which is a statue of St. John. The interior is much admired for its proportions: eight granite columns, placed between four piers decorated with pilasters, are arranged round the basement storey, which support a second order of piers, arranged in a similar manner, on which the dome rests, which is famous for its echo, as the sides produce the well-known effect of whispering-galleries. In the plan drawn by J. and F. de Milanis, preserved in the British Museum, columns are not shown in the interior. In the middle of the baptistry is a large octagonal basin of marble, raised on three steps. Within the basin there are four circular places hollowed out for water, and round the centre of the basin, which is occupied by a pedestal, is a place likewise hollowed out for the priest, who was thus enabled to turn from one basin to the other. By this means confusion was prevented, which would otherwise have occurred from the crowd pressing to one side of the font only. The city of Ravenna and the episcopal cities of Tuscany have also their baptisteries.

The largest known baptistry ever erected was that belonging to the church of St. Sophia at Constantinople, which is said to have been so spacious as to have once served for the habitation of the Emperor Basil; and in it also a very numerous body of persons once assembled in council.

The multangular edifices placed at the sides of cathedrals, which are called chapter-houses, are very similar in plan to the ancient baptistry. It is possible that they were originally used for that purpose. Bede mentions a wooden oratory built in haste at York for the express purpose of baptizing Edwin, King of Northumberland, on Easter Day, A.D. 627, from which circumstance it would seem that baptisteries were formerly erected in England. The baptismal font is not synonymous with baptistry, but should be applied only to the large stone vessel placed in the centre of the baptistry. At the close of the sixth century the baptismal fonts belonging to baptisteries began to be placed in churches. At a font placed in a church the French king Clovis received baptism at the hands of St. Remis, archbishop of Rheims.

CHURCH BUILDING AND RESTORATION.

Berwick Church, Shrewsbury.—This interesting old church, which stands in a charming situation in Berwick Park, has been built at different periods, the older portions of the nave dating back probably to the sixteenth century. Until recently it consisted of a nave, tower and porch. The tower was built about the year 1672 by Sir Samuel Jones, who endowed the church and built and endowed the adjoining almshouses and hospitals. The church has recently been enlarged by Mr. James Watson, for many years M.P. for Shrewsbury, by the erection of a new chancel, south chancel aisle, organ-chamber, clergy and choir vestries and north and south porches, which were consecrated by the Bishop of Lichfield on the 28th ult. The buildings are of Grinshill stone in the Classical style of the buildings of the seventeenth century. The semicircular chancel arch is the full height of the nave, so as to afford an uninterrupted view of the east end. There are four mullioned windows lighting the chancel and organ-chamber. The ceilings are semicircular vaults panelled with moulded ribs. The east window has been filled with richly stained-glass by Messrs. Comere & Capronnier, of Brussels, representing "Christ Blessing Little Children." The other windows are in geometrical patterns, by Messrs. Camm

Bros., of Smethwick. The handsome seventeenth-century wrought-iron altar railings have been restored and refixed. The chancel is paved with encaustic tiles from Messrs. Godwin's Lugwardine Tileries, Hereford. The south chancel aisle contains oak seats for the inmates of the adjoining almshouses. The ancient oak pulpit has been restored and refixed. The oak choir seats, prayer desk and eagle lectern have been made by Messrs. Jones & Willis, from designs prepared by the architect. The two-manual organ has been erected by Messrs. Walker & Sons, of Francis Street, Tottenham Court Road, and is a very fine and powerful instrument. The whole of the walls of nave and chancel from floor to ceiling have been panelled in oak with carved cornices, the east end having emblematical carvings by Mr. T. Catley, of Kennington, London. The hot-water heating, gas-fittings and ironwork are by Lea, Sons & Co., of Shrewsbury. The whole of the works have been carried out from the designs and under the superintendence of Mr. F. B. Osborn, architect, of Birmingham, the contractors being Messrs. W. Bowdler & Sons, of St. Julian's Friars, Shrewsbury, Mr. James Thornclow having been clerk of the works.

Ventilation and Flushing of Sewers.

SIR,—Having for some time been watching the development of sewer ventilation and its effect on public health, I read with considerable interest your extracts from the report of Dr. Clark on the above subject in a recent number.

The fact of the deposit of soil on the highly-glazed ware of the syphons attached to the modern wash-down closet is patent to all, as is also the fact that it does not appear to be affected by the periodic flush of water, but requires something with a greater abrasive power than water to effect its removal. This deposit takes place to a much greater extent in the rougher sewer-pipes, and it is undoubtedly by the decomposition of the lining so deposited that the disease germs are evolved, more than by the decomposition of the sewage as it is flowing to the outfall. While, therefore, the copious and periodic flushing of sewers is undoubtedly a potent factor for the good of the public health it is by no means all that is required.

Except, perhaps, after heavy rains, when a quantity of abrasive matter has been carried through the drains, this decomposing lining is always present in the sewers and evolving the gases so noxious to health, and the wisdom of providing such ample and ready means for those gases to escape into the streets certainly admits of question.

Beckenham, it is stated, has ventilators at every 82 yards, and is admirably sewered, but my own experience is that from these ventilators very strong and evil-smelling gases emanate. Are these gases, on account of being diluted with air, altogether innocuous? The instances quoted in the case of Woolwich and Plumstead seem conclusively to prove that they are not innocuous, and that being so, would it not be infinitely better to confine these gases as much as possible in the sewers, rather than to dissipate them into the air in our streets, where they are liable to be inhaled with more or less dangerous results to the persons so inhaling them?

The advisability of ventilating our sewers so that the danger through inhaling any gases which may by any chance be forced out of them would be minimised is unquestionable, and of course it is necessary to provide means to equalise the atmospheric and sewer-air pressures, so that by no chance could the sewer gases be forced past the syphons and traps into the houses.

Are not both these points sufficiently provided for, by constantly circulating a smaller quantity of air through the sewers by means of ventilators, which by heat or other means render the gases passing through them quite innocuous so far as their power to produce disease is concerned? There are several such ventilators; it has been objected to them that they are expensive to maintain in working order, and that the gases after passing through them are not devoid of smell. With regard to the expense, has not the mistake been made of providing too many of them? With regard to the other objection, any one encountering the gases emitted from the ventilators would know that beyond the fact of the smell being disagreeable there was no harm, and would be saved the involuntary shudder often experienced now when unexpected, by inhaling some of the gases which the authorities have been at such trouble to convey to us direct from the sewers.

Where the sewer gases are delivered into the outer atmosphere without treatment of any kind, the higher from the streets such outlets are the better, but the disfigurement caused by these tall ventilating shafts is very great and unfortunately is very much in evidence in some of our most beautiful towns.

Often the tops of these shafts are to be seen level with and at no great distance from bedroom windows, and it does not seem too much to suppose that by their means the disease germs in the gases find their way into the bedrooms.

The shafts at Beckenham are not unsightly, but they are certainly not high enough to dissipate the sewer gases without offence and perhaps danger to the public.

They would be amply tall enough, however, if the gases were first rendered innocuous, and this at the present time, when appearance justly counts for so much, is another strong argument in favour of these germ-destroying ventilators.

Again, these ventilators, when heat is the destroying element, induce a strong upward current through them, and with them there is much less likelihood of finding that the surface gratings act as outlets for the sewer gases, as is too often the case where tall shafts are in use.

I am strongly of the opinion, and think that Dr. Clark's report fully supports me in this, that it is not in the absolute confinement of the gases in sewers nor in the free dissipation of them in our streets that the greatest safety to the public health is to be found, but in a happy medium where the gases are fairly diluted in the sewers and at the same time the gases withdrawn from them are rendered innocuous before people are given the chance of breathing them.—Yours faithfully,
ENGINEER.

GENERAL.

Forty-two Sets of Designs were sent in for the proposed market in Weston-super-Mare. The winners of premiums are Messrs. Price & Wooller, Weston-super-Mare; Messrs. Wilde & Bryan, Weston-super-Mare; and Mr. Daniel Arkell, Birmingham.

Mr. H. L. Hammack, architect and surveyor, who died recently during a tour in Germany, was one of the oldest members of the Corporation of London, for he was elected to the Court of Common Council in 1865, and was annually re-appointed down to this year. In 1881 he was made deputy-alderman of the ward of Bishopsgate. He was one of the lieutenants for the City and the Tower Hamlets, and a Justice of the Peace for the county of London. Mr. Hammack was in his sixty-eighth year.

The Duke of York will lay the foundation-stone of the new Birmingham Hospital to-morrow. The cost of the building will be 200,000*l.*, or about 360*l.* per bed, of which sum the committee have raised about three-fourths.

A New Hotel containing forty-five bedrooms is about to be erected at Hunstanton, by Mr. Thomas Rose, of Norwich.

Mr. J. G. O'Sullivan has been elected sanitary engineer for Dublin. The other selected candidates were Mr. Lawless, C.E., Mr. MacDermott, Mr. Sutter, C.E., and Mr. Petit Wardrop.

The Cleethorpes Hall Competition has been decided. The first prize has been awarded to Mr. John R. Withers, Shrewsbury; the second to Mr. Solomon Ford, Queen Street, Cheapside; and the third to Mr. J. Mitchell Bottomley, Middlesbrough.

Mr. D. H. S. Cranage, M.A., will deliver a course of twelve University Extension lectures in Newcastle-upon-Tyne, on "Gothic Architecture," commencing on the 20th inst.

An Urgent Appeal is being made, says the *City Press*, to the charitable public for the sum of 5,000*l.* to defray the cost of the extension of the Central London Throat, Nose, and Ear Hospital, Gray's Inn Road, which is rendered necessary by the overcrowding of patients.

The London Tramways Company are having cars on their Streatham Hill route fitted with the incandescent lamps.

The Directors of the French School of Archaeology at Athens propose to excavate the site of the Temple of Athene Alea at Tegae. The sculptures of this most important building were by Scopas, and a few fragments brought years ago to Athens are the best data possessed for judging of the style of that sculptor. A committee has been appointed to consider a scheme of excavation.

The Employés of the firm of Messrs. S. Pearson & Son, engaged in the construction of the Blackwall and East Greenwich Tunnel, recently presented Sir W. and Lady Pearson with a testimonial in the form of a sterling silver model of the caisson used in the boring of the tunnel, and which was executed by Messrs. Mappin Bros., of Cheapside.

Sir F. de Winton has informed the Mayor of Leeds that the Duke and Duchess of York will open the new buildings at the Yorkshire College on Friday, October 5.

The Liverpool School Board have decided to purchase for 5,000*l.* 1,505 square yards of land at the corner of Pleasant Street and Clarence Street for the erection of a new pupil-teachers' college.

The Architect.

THE WEEK.

ANCIENT Egypt will always have a fascination for one class of students. There is a mystery about it which gives a piquancy to investigation that is not afforded by any other region. The late BRUGSCH PASHA, who died in the pleasant suburb of Charlottenberg, near Berlin, on Sunday, was one of those fortunate students who can indulge their hobbies in official positions. Forty years ago Professor BRUGSCH was sent to Egypt by FREDERICK WILLIAM IV. On his return he was appointed keeper of the Egyptian Museum in Berlin, and if he is to be credited with the systematic arrangement of the contents he merited the thanks of all Egyptologists. He brought out a noble work on the Egyptian monuments. The years 1857 and 1858 were spent by the Professor in Egypt. In 1860 he was attached to the Prussian Embassy in Persia, and after the death of the Baron VON MINUTOLI he became its director. He travelled through the greater part of Persia, and in 1861 he wrote an account of the mission. Professor BRUGSCH became Prussian Consul in Cairo in 1864. After four years he returned home, and was appointed Professor of Egyptology in Göttingen. Two years afterwards he went back to Egypt as director of the Ecole d'Egyptologie in Cairo. He aided in organising the Egyptian departments in the Universal Exhibitions in Vienna and Philadelphia. The downfall of the Khedive ISMAIL ended his official connection with Egypt, and once more he returned to the Fatherland. He was a perfect type of the Prussian official and professor. BRUGSCH possessed the deepest knowledge of Egyptian antiquities, but he was also an organiser and man of business. The duties of every office to which he was appointed were performed with military precision.

As long as the Metropolitan Building Acts are in operation it is not wise for contractors to evade the provisions. The operations which were explained in a case that was heard a few days ago at the North London Police Court by Mr. HADEN CORSER cannot, we are sure, have the approbation of any builders' society. Messrs. SILK were summoned by Mr. LEGG, the district surveyor of Hackney, "for that they did, contrary to the Metropolitan Building Act, cut into the party-wall between Nos. 413 and 415 Mare Street, Hackney, by inserting a rain-water pipe without previously giving notice to the district surveyor." The builders were also charged with omitting to reopen the work for the inspection of the surveyor. The charge relating to the notice was withdrawn on technical grounds. Mr. LEGG stated that on June 14 he saw defendants inserting drain-pipes in a party-wall, for which notice was not given. Afterwards notice was sent. When he next visited the wall Mr. LEGG found the bricks were reinstated. The defendants declined to open the wall for inspection until they obtained the owner's consent. The surveyor was then informed that the consent would not be given. For the defendants it was pleaded that they had left the premises, and according to the judgment of the Queen's Bench, when reversing a decision of Mr. CORSER's in a similar case, that rendered them safe from liability. The magistrate considered he was bound by that case. The Queen's Bench Division had decided that if the work had been completed the district surveyor had no remedy. In his opinion the judgment placed a premium on law-breaking. All that a builder had to do where there was an irregularity was to keep quiet until the work was completed and then the district surveyor had no remedy. The summons was therefore dismissed. The duties of district surveyors are not always agreeable to builders, but as they are not creations of those officials there can be no advantage gained in putting them to inconvenience. In the present case Mr. LEGG has suffered for being lenient. He should have enforced the Acts forthwith. The result must cause other surveyors to be more exacting, and in that way the building trade will not gain much by the temporary success of one firm.

A MANSION has been constructed in the Avenue Hoche, Paris, from the plans of M. RICARD, containing thirty-five

sets of apartments. For some a rent of 24,000 francs a year is demanded. One of the features of the building is a gorgeous salon which is at the disposition of the tenants in succession. It will accommodate over six hundred visitors comfortably. In addition there are small salons on every floor. It has been calculated that if an income of 1,000 francs a day can be derived from the building, the proprietors will not gain more than 3 per cent. on the outlay.

ON Wednesday Mr. JAMES TAYLOR died near Liverpool. He might be associated with Mr. JOHN LAIRD as one of the creators of Birkenhead. According to the *Liverpool Courier*, Mr. TAYLOR belonged to Glasgow, where he was born in 1817. For some time he was connected with the firm of Messrs. FOX, HENDERSON & Co., of London and Birmingham, but in 1852 he came to Birkenhead and established the Britannia Works, which quickly became one of the most important concerns of its kind in the country. He was the inventor and builder of many of the largest steam cranes now in use in the United Kingdom, and at the time of his death he was busily engaged in perfecting these marvellous pieces of engineering skill. Mr. TAYLOR was also the inventor of the floating graving-dock. He was one of the most skilful as well as one of the most courageous pioneers of engineering works.

THE following resolution was adopted at the meeting of the Associated Chambers of Commerce on Wednesday:—"That it is desirable that an authoritative standard of measurement of foreign-imported balk timber be established for all purposes, and that the measuring authority mark the ship's initials, the number and the contents upon each place in the most unmistakable characters (the authority measuring for the purpose of payment of sea freight appears to be the best and most convenient one), and that the executive be asked to take the necessary steps to bring about such an enactment." The arrangement is already adopted in some ports, and has worked well. There would be an advantage if it could be adopted generally.

THE inquiry into the character of Roman fortified lines, under General VON SARWEY and Professor HETTNER, is likely to produce information in Britain as well as in Germany. The examination in the North of England of HADRIAN'S wall has been in progress until the end of August, and will be resumed during next summer. From the cuttings which were made at Lanercost, Greatchesters, Whiteloss and Brunstock, in Cumberland, it is concluded that the defence was constructed on the system which prevails in railways, or, in other words, the embankment or mound was made out of the cutting of the central ditch. It was revealed that near the wall was an excellent-paved footpath as well as a military road. A turret and walls of other buildings were met with at Greatchesters. The German excavations have been very successful this year. At Hofheim, between Wiesbaden and Frankfurt, the remains of a fort about 600 feet square were discovered, which from its position was intended for the observation of the Rhine Valley. The fort at Zugmantel was ascertained to be an enlargement of a more ancient structure. Several ditches and mounds which remain are supposed by Herr JACOBY to have been intended to serve as fixed points for the Roman surveyors when laying out camps and boundaries.

FORTUNE was not kind to the French in their explorations on the site of the Temple of Apollo at Delphi. M. HOMOLLE, the director, is compelled to own that it is remarkable to find in the course of excavations so extensive so small a number of architectural fragments, while there has been a total absence of examples of decorative sculpture. He believes the Roman emperors removed piece by piece the two groups which PAUSANIAS described, as well as the metopes. M. HOMOLLE believes there were only six columns in the façade of the temple. The sides were very long, but the number of columns cannot be stated with accuracy at present. The unearthing of the temple and the sacred inscriptions are a recompense for all the trouble and expense. Since he prepared his report we understand M. HOMOLLE has been rewarded by the discovery of two archaic statues at Delphi.

POLYGNOTUS THE WALL-PAINTER.—II.

IF we can suppose that POLYGNOTUS was the friend of CIMON, and stood on the same footing as PHIDIAS with PERICLES, the painter was not likely to have remained in Athens after the banishment of his patron, which took place about the year B.C. 457. His painting of *The Slaughter of the Suitors by Ulysses*, in the Temple of Minerva at Platea, his works for the Thespians, and his two immense wall-paintings in the Lesche, at Delphi, might then be considered as the productions of his voluntary exile. With no less reason it can be supposed that those works were executed prior to the appearance of the painter in Athens. On what grounds he was selected by CIMON cannot be determined. As there is no mention of wall-painting by POLYGNOTUS in any part of Thasos, his early reputation may have been gained by portable works which were of a character that made them suitable for presentation in temples. Was it possible for CIMON to conclude from seeing them that the artist was competent to produce wall-paintings on a grand scale that would be worthy of Athens, as the capital of confederated Greece? Some speculators have hesitated to accept that conclusion. They believe it is more reasonable to assume an earlier practice in wall-painting by POLYGNOTUS, and that his works in the Lesche, at Delphi, were of prior date to those in the Athenian Stoa. The difficulty is only evaded by that reasoning, and is not overcome. The people of Delphi must have had some evidence of his competence before they entrusted a building to his operations, and they were probably as fastidious critics as the Athenians. Although the French explorers are disappointed by the result of their recent excavations, they do not suggest that the wealth of the city was exaggerated. Repeatedly Delphi was subjected to plunder, for it was the most favoured of all the Grecian shrines. The presents of devotees made of it an unparalleled museum, and with the most beautiful examples before their eyes the people were not likely to encourage unskilful painters. CIMON's influence was strong enough to gain at least temporary tolerance for defective work in Athens, but in Delphi there was an oligarchy with severe views about what was worthy to be submitted to their eyes. On the whole, therefore, it seems more reasonable to believe that when POLYGNOTUS arrived with the intention of embellishing one of the buildings of the sacred city, his reputation as a mural painter was established by his work in Athens.

Whether his paintings in the Delphian Lesche surpassed those in the Poecile Stoa is never likely to be revealed. It is certain, however, that the two in the Lesche are the most carefully described of all his works; indeed, there were no ancient examples which were favoured with such long notices by PAUSANIAS. Unfortunately, with all his elaboration it is not possible from what he says to comprehend the arrangement of either of the paintings. No canons which are now respected will apply to them.

Painters are expected to have a definite point of view when treating a subject, and they are also supposed to limit themselves to the action of a moment. As we stated last week, the works of POLYGNOTUS suggest that he insisted on more liberty. In what way he exercised it we have no means of knowing. He may have separated the various scenes which made up his pictures by definite bordering lines to prevent confusion. On the other hand, we know from the Parthenon Marbles that Greek artists were not rigorously bound by ordinary laws of fitness, for figures of deities who are supposed to be seated on Olympus are introduced among the people who take part in the Panathenaic procession, regardless of their incongruity. In some sculpture, like the frieze of the Lysicrates Monument, which has survived, it is also evident that synchronism is not respected. The architectural requirements enforced more or less regularity and symmetry in sculpture. In treating a large wall there was more opportunity for license, and if POLYGNOTUS introduced intervals between his scenes, it is not clear how they could avoid the appearance of a sort of irregular patchwork.

The Lesche was a place of public shelter in which the Delphians could discuss theological, philosophical, political, domestic or other subjects at their ease, while enjoying the spectacle of one of the finest landscapes in all Greece. It was apparently more architectural in character than the

Stoa in Athens, which ZENO and his disciples honoured by their presence. As a consequence, the wall-paintings by POLYGNOTUS remained longer in a perfect state than his works in Athens. He undertook the painting of the two side walls, which were the longer. The subjects selected related to the Downfall of Ilium and the Visit of ULYSSES to the Shades. Both were Homeric, but the scenes did not exactly correspond with those described in the "Iliad" and "Odyssey."

On the right-hand side as one enters, says PAUSANIAS, one sees that Ilium is captured and the Greeks are about to depart. A modern painter would be likely to represent that scene by placing the sable ships in front with the sailors busy, a crowd of troops and captives in the middle distance and the ruins of Troy in the background. The Greeks could not appreciate that sort of arrangement. They may not have been adepts in perspective, but if they were it would not be of much use to them in historical pictures. It is only necessary to study a photograph of a large group to realise the difficulty of compelling subjects to become subservient to the needs of composition. All the elements have an equally strong desire to excite attention. In Greece the desire was not quite so selfish, for what was sought was recognition of the importance of the representatives of a family or a town or a district. According to SPENSER, the Irish bards were ready to extol a young outlaw for the share of a stolen cow, and "then waxeth he most insolent and half-mad with the love of himself and of his own lewd deeds; and as for words to set forth such lewdness, it is not hard for them to give a goodly and painted show thereunto, borrowed even from the praises which are proper to virtue itself." It is evident that in HOMER's day there was no less eager a desire to have a goodly and painted show made of deeds that were as immoral as those of the Munster rapparees, though in course of time they were supposed to be sublime. HOMER tried hard to earn a reward by liberality in awarding praises, but the demands were more than he could manage, and he settled accounts with the surplus by his Catalogue of Ships. A liberal patron found one of his ancestors performed a heroic act; a stingy one could not expect more than to see the name of his native village mentioned in the Catalogue of Ships, without even the distinction of a characteristic adjective. In art we see evidence of a spirit no less exacting. It shows itself in the employment of one plane for subjects, and in the care which was taken in the pictures of POLYGNOTUS at Delphi to arrange the groups in such a way that the characters could be identified, an end which was further secured by inscribing names near the figures, which was also a common practice in vase-painting. How far the selection of subjects was inspired by local interest in men and women must be left to surmise, and it is not impossible that some figures were introduced to cause dissatisfaction to enemies of the Delphians.

From the incidents which were represented the spectator saw that Troy was conquered, some of them taking place within the town and others outside. If the painter wished to suggest that war does not in reality come to an end as promptly as it does on a stage, he could not have adopted a more effective way. The first pictures of the series which met the eyes of visitors were those which suggested the attainment of that end which "the princes orgulous, their high blood chaf'd," sought when they set out from Greece. HELEN, it would be seen, was about to return to Sparta, and was depicted as seated. She was guarded by DIOMEDE, and accompanied by BRISEIS and other women, who seemed to be fascinated by that fatal beauty which brought woe to them as to many others. Preparations for her departure were in progress. Men were removing the two tents of MENELAUS, and on board his ship the sailors were engaged, under the direction of PHRONTIS, who, according to HOMER, was "a mariner past all expert, whom none in steering matched when tempests roared." The three pictures formed the climax of the series.

But for the triumph of the Greeks the Trojans were compelled to suffer, and the remaining paintings were devoted to representations of the last effects of the contest. HELENUS, the wise son of PRIAM, was seen in a dejected state, clad in sad purple, and near him were three wounded chiefs. Two figures recalled one of the consequences of

ancient warfare. *ÆTHRA*, *PITTHEUS*'s daughter, the mother of *THESEUS*, was a prisoner in Troy attending on *HELEN*, but there was no league formed to accomplish her rescue. The woman escaped, and in the picture she was seen appealing to *DEMOPHON*—who was her grandson—for her liberty, to his apparent confusion. Then came *ANDROMACHE* and some of *PRIAM*'s daughters, and in front of *HECTOR*'s wife was a boy. Two other groups of captive women were shown in this part of the picture, and as four of them were seated on a couch, it is not unreasonable to assume that the three groups were not supposed to be outside the walls; and if that could be allowed it would help us towards determining the arrangement.

NESTOR was introduced as holding a spear and wearing a pileus instead of a helmet. He must have been represented as standing or seated on the shore, for beside him was a horse which was about to roll itself in the sand; and, moreover, *PAUSANIAS* refers to the pebbles which were in front. *POLYGNOTUS* may have intended to contrast the success of the old hero, symbolised by the possession of one of the famous Trojan steeds, with the fate of *PRIAM*, whose corpse was seen in another part of the picture. *PAUSANIAS* next refers to the nude figure of *EPEIUS*, who appeared to be engaged on the demolition of the Trojan wall, that was further indicated by the introduction of the wooden horse, which he constructed.

Another group, one of several figures, follows in the description of *PAUSANIAS*. It represented the declaration upon oath of *AJAX OILEUS*. That warrior was alleged to have outraged *CASSANDRA* in the Temple of *Athene*, and in consequence he and the other Greeks were storm-tossed after leaving Troy. In the painting, says *PAUSANIAS*, *CASSANDRA* is seated on the ground holding the figure of the goddess, which she retained when dragged away. *AJAX* with a shield stands near an altar. The witnesses were *AGAMEMNON* and *MENELAUS*, *ULYSSES* and others. Another crime of the Greeks was also depicted. *NEOPTOLEMUS* having slain *ELASUS*, appeared as killing the wounded *ASTYNOUS*.

Several single figures and groups of two are mentioned. A boy was shown clinging to another altar on which a cuirass was placed, and beside it was *LAODICE*, the most beautiful of all *PRIAM*'s daughters. There was also a bronze basin on a stone base which was held by *MEDUSA*, another of *PRIAM*'s daughters. Near her was an old woman holding a child that was in terror. Then came figures of slain warriors, who were lying on the ground, old *PRIAM* being among them. *SINON*, a companion of *ULYSSES*, was seen carrying the body of *LAOMEDON* to burial. In the last place appeared *ANTENOR* and his family, on whose house was hung a panther's skin, which was a sign the place was to be respected by the Greeks as a return for his hospitality. The prince and his children appear as if about to depart from Troy, and thus the two extremities of the series were marked by preparations for a journey, but under very different conditions.

PAUSANIAS was only human, and his attention may not have been concentrated with equal force on every part of the paintings. In our time it would be impossible to realise the contents of a wall in a picture exhibition from the descriptions in the journals. Some works are passed over, in others only the principal figures are noticed. What happens constantly in London and Paris might be excused in Delphi. It is also a fact, every modern guide-book is incomplete in its description of galleries, and *PAUSANIAS* was compelled in his day to consider the limited curiosity of his readers. If he were exhaustive they would be bored, and he evidently was not troubled about the desire for information by people who were to live in *Ultima Thule* eighteen hundred years afterwards. On that account the utmost caution should be exercised in all attempts to realise the decoration of the Lesche.

Let us assume, however, that the descriptions are complete. What must first strike a restorer is the difference between the groups which arises from the number of the figures. While only two figures are mentioned in some cases, in others there are seven. Pictures with single figures like *EPEIUS*, who we are to imagine was able without other aid to throw down the walls of Troy, and *NEPTUNE* with his tumbling horse, are also puzzles. Scholars were satisfied when they were able to imagine or to indicate by

feeble sketches a few scenes that seemed to correspond with the descriptions. But can we imagine that Greeks were able to consider a wall was decorative which in the remotest way corresponded with the realisation which the two *RIEPENHAUSEN* attempted in their "Erläuterung des Polygnotischen Gemählde auf der rechten Seite der Lesche zu Delphi"? To powder a wall irregularly with conventional ornament in Japanese style is not unsatisfactory if there is not over-much affectation apparent, but it is different when the powdering is made up of elaborate groups of warriors and long-robed women, mixed with single figures standing or supine. It is not sufficient to arrange the compositions in several rows, for if horizontal order is obtained the vertical disorder becomes more astounding.

If we are to take the descriptions of *PAUSANIAS* as exact, we are compelled to conclude that he adapted his paintings to suit wall space that was cut up by a variety of dividing lines. Where there were broad spaces available he made use of subjects like the Swearing of *AJAX*, while in limited spaces he introduced groups of two or three figures or single figures. That, we consider, is the most rational way of considering the subject, but as generally little thought is bestowed on the character of the wall space in the Lesche, it is no wonder that the attempted restorations of the pictures are suggestive of works that are semi-barbarous.

On the opposite wall *POLYGNOTUS* attempted what was the most difficult of all subjects. When *ULYSSES* was told by *CIRCE* that he must visit *Hades* in order to consult the blind *TIRESIAS*, he confessed that his courage failed him, and he spent the day in weeping. To the Greeks there was nothing unmanly in his fears, for what could be more awful to so active a race than life in the dreariest of regions? All that was enjoyable was absent from it, and *ACHILLES* expressed the general belief in saying it was preferable to be a hind in Greece than to reign in the shades. *POLYGNOTUS* did not extenuate any of the horrors. *DANTE* and *MICHEL ANGELO* would have been in an ecstasy if they saw the pictures. He represented in one of them *CHARON* conveying a party across *Acheron*, and among the crowd in the boat was a priestess of *CERES*, in *Thasos*. On the shore could be seen a father strangling an ungrateful son, and a fury (*LESSING* says a Greek never painted one) torturing a man who committed sacrilege. The figure of *EURYNOMUS*, the god of vampires and vultures, was, according to *PAUSANIAS*, a wonderful bit of painting, for his flesh was blue and black like the big flies that are to be seen alighting on meat. Another painting represented the scene in the eleventh book of the "Odyssey," where *ULYSSES* on his knees guards the hollow which contains the blood of the victims, a draught of which enabled the ghosts to recognise mortal visitors. The figures of *TIRESIAS*, the seer, *ELPINOR* and others, including the mother of *ULYSSES*, appear anxious to regain memory on any terms. There are also ghosts who were doomed to fearful sufferings, such as *CENEUS*, who afforded a perpetual meal for an ass; *TITYUS*, whose liver was inexhaustible for a vulture; *PHEDRE*, whose hanging was continuous; *SISYPHUS*, *TANTALUS* and others. The Homeric heroes suffered in their minds if their bodies escaped. *HECTOR* appeared seated and clasping his knees, a sort of statue of hopelessness. *AJAX OILEUS* had still the foam of the waves upon him. *AGAMEMNON* could not escape from his paternal, imperishable, golden-studded sceptre, and must have appeared as an ancient Commissioner *PORDAGE*. If *POLYGNOTUS* was not a pessimist, he did his best to convince others of the vanity of eternity as well as time. Happily the Greeks were able to take the doctrines as if they added a zest to life, and as they tried to enjoy all around them they may have often smiled before the *Halls* in the Lesche. An artist's talent is only adapted to express beauty; the exciting of terror is beyond him. Hence it is so many paintings of the same class as the *Hades*, which are found in Christian churches, have become incumbrances, and tourists are not afraid to make mockery of the great work of the Florentine.

What became of *POLYGNOTUS* is among the unknowable events. As an artist he may have prepared the way for *PHIDIAS* as for *APELLES*; but successful men like them rarely care to acknowledge indebtedness to predecessors. As has happened with many another painter, nothing has

survived to enable a later age to judge of the value of his works, and his merits must be taken on extrinsic evidence. But POLYGNOTUS will at least always remain as a tantalising object, and the descriptions of his works will be an endless puzzle.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE monthly meetings of this Association have just been resumed. Mr. Alexander N. Paterson, M.A., delivered the presidential address. He first reviewed the work of the past decade, and found in the record of its meetings, visits, designing competitions and publications reason for congratulation. The average roll during the period has been over 100, between 60 and 70 of whom are architectural draughtsmen and pupils, yet after all that is less than a half of those employed in the different offices. Mutual benefit would result from their becoming members. The President further spoke on the propriety of the three architectural bodies in Glasgow consolidating. The second part of the address was devoted to a consideration of how far style in architecture may be followed, while yet preserving the individuality of the designer and having regard to national characteristics. History proves that no abiding style had ever been of forced growth; the outcome of express desire for an architectural change, and the mere introduction of new materials is not sufficient; glass and iron have not altered the essentials of style. Revived Classic—the architecture of the Renaissance—was incontestably the architecture of modern civilisation; its adaptability was established, and its restraints are no curb to true originality, as all may see who study the work of the early Italian architects. A terrible monotony in this cosmopolitan style is obviated by national characteristics of material and social customs, and of these Scotland has her share. The remainder of the address was the elaboration of this idea, that the Scottish phase of the Renaissance is worthy of study, and should be fostered. The vote of thanks was moved by Mr. Conner, vice-president, and supported by Mr. Campbell Douglas, hon. treasurer. The meeting resolved to forward a memorial to the Town Council regarding the Tron Steeple, urging that it be left as it is at present. Attention was also directed to repairs in progress at the cathedral of indifferent character, and it was remitted to a committee to investigate and report.

THE STORY OF A BAS-RELIEF.

A CORRESPONDENT of the *Glasgow Herald* furnishes the following record of the adventures of a representation of one of the corporate worthies or Nicol Jarvies of the last century, the Provost Archibald Ingram:—There is, as far as known, no picture of Provost Ingram—at least none could be heard of for "Old Glasgow"—but the provost appears in a bas-relief which is fixed above the fireplace in the directors' room of the Merchants' Hall. In this bas-relief he forms the centre of a group; he kneels to receive a civic crown at the hands of the Genius of Glasgow; the geniuses of commerce, architecture and civic rule stand behind him and smile on the function. The provost's figure is evidently from nature; the others, I believe, are ideal. The bas-relief has a history.

At a meeting of the Merchants' House on June 13, 1809, Mr. John M'Caul intimated that Mr. Robert Ingram, of London, a grandson of the late Provost Ingram, had sent down a monument to be placed in one of our public halls in memory of his grandfather; further, that Mr. Gilchrist, of Edinburgh, a near relation of the provost's, had requested that the monument should be placed in the Merchants' Hall. The House thereon agreed to Mr. Gilchrist's request, and appointed Dean of Guild John Hamilton, of Northpark, and three others a committee to carry the same into execution. From whatever cause, Northpark and his three colleagues did not carry the same into execution, and Provost Ingram and the geniuses vanished for over half a century. It is uncertain exactly how they spent the interval; the Merchants themselves spent it mostly on the tramp.

In 1809, when Mr. M'Caul intimated the receipt of the bas-relief, the Merchants were housed in their hall in the Briggate, built, or rather rebuilt (as M'Ure tells us), "in a most stately manner in the year 1659, Sir John Bell being dean of guild and Sir William Bruce architect, a magnificent structure of length from east to west 72 feet; the steeple thereof hath three battlements of curious architecture above one another, and a curious clock of molten brass, the spire whereof is mounted with a ship of copper, finely gilded, in place of a weathercock." But in 1817 the Merchants resolved to move from the Briggate to a "genteel and central part of the town," and sold the magnificent structure to a builder, who pulled it down forthwith, and on the site built "Guildry Court." In the sale the steeple was "retained entire as an ornament to the city, with a servitude of access." A tasteless Merchant wished to bind the builder

to a building plan that should show off the steeple from its base; the House promptly sat on him. The whole "beauty of the steeple was in the upper part above the clock;" the lower part was thoroughly unclassic, Scotch in fact, "a naked square tower, which had better be hid," and effectually Guildry Court hides Sir William Bruce's rude old structure. After evicting themselves from the Briggate the Merchants were a long time of having another homestead of their own. They had long debate over a new hall; it was to be much above the scale anno 1659; it was to be in a genteel and central part of the town. Where was the money to come from? Where was the hall to be? They had no need to hurry over the matter. By the kindness of the town they were lodged in the Town Hall at the Cross, comfortably and cheaply; they paid for some cleaning and painting, but they paid no rent. They saw their way first to the ways and means for their new hall; they were worse put to it to choose among various sites offered them in Queen Street, in Virginia Street, and elsewhere; at last they fixed on a site in Hutcheson Street, Eastside, and in 1843 they took possession thereof of Hall III. They were not allowed to rest there long. In 1869 they were evicted (per Act of Parliament) by the Court-House Commissioners, and left to shift as best they could. They again found friendly shelter. The Chamber of Commerce was then quartered in the Bible Society's Rooms at the corner of Virginia Street and Wilson Street, on the present site of the Law Life Insurance Society, and it made room there for the Merchants. Neither Chamber nor House is in constant session, and the two chummed on a Box and Cox arrangement, and got on so well that they have chummed so ever since. At last, in 1877, just two generations after their flitting from Hall II. in the Briggate, the Merchants installed themselves, surely this time for good and all, in Hall IV. in George Square. Part of Hall III. became the Sheriff's Small Debt Court, and is so now; part of it which became the City Chamberlain's office has been empty ever since the opening of the new City Chambers, and has now the forlorn dilapidated look of a Plan of Campaign homestead.

The Ingram bas-relief has meantime had many wanderings, but it has wandered home at last. The early moves can only be traced by conjecture. In Old Glasgow storage (nowadays only too plentiful) was scarce, and too much advantage was taken of the ample capacity (72 feet from east to west) of the Merchants' Hall in the Briggate. To check the abuse the House in 1778 decreed that "goods, barrels, timber, or other articles (unless removed on distress of fire or damage by water) should not in future be lodged or stored in the Merchants' Hall or garret above the same." In spite of this decree the Ingram bas-relief was, I fear, lodged and stored in the garret of the Merchants' Hall, and lay there till the Merchants' flitting in 1817. It was then, no doubt, stowed away somewhere about the Town Hall at the Cross. Its next move is certain—it was to Merchants' Hall III., in Hutcheson Street, Eastside, and there in 1859, fifty years after the receipt of it from Mr. Robert Ingram, of London, it was discovered. Its discovery is one of the many good offices we owe to Sir Michael Connal. Nowadays, for the comparatively small sum of one pound one anybody can read about the Ingram bas-relief in the "History of the Merchants' House," but in 1859 this monument of the liberality of Dean of Guild Archibald Orr Ewing and the learning of Collector William Henry Hill did not exist. The manuscript minutes of the House did, however, exist, and Andrew Scott, late of H.M. Customs, had devoted much of his blessed leisure to extracting them. Michael Connal (he was not Sir Michael then), "always roaming with a hungry heart" through Old Glasgow, its records and its relics, came on his old friend's extracts, and hunting through them, caught scent of the Ingram bas-relief. Where was it? No one knew. Since June 13, 1809, there was not a trace of it; its very existence had been forgotten, let alone its whereabouts. But Michael Connal was one of those curious persons one meets every now and again, who positively like trouble, revel in it; and after a long chase he ran the bas-relief to earth in the cellar of Hall III. There it quietly lay in the case in which it had come down from London in 1809; the very straw still wrapped it round. One can see the twinkle in Michael's eyes as they prised off the lid, and the provost and the geniuses leapt to light. The provost, on unpacking, was found a little the worse for wear, but quite mendable; his companions had taken no harm from all their knocking about. They bore the group reverently upstairs to the directors' room, and at their next meeting on June 14, 1859, on the motion of ex-Dean of Guild James Hannan, the directors resolved to make what amends they could for long neglect. At a cost of 14*l.* 10*s.* they had the group "sorted" by Mossman the sculptor, and they set it up above the fireplace in their own room. The ancient request of Mr. Ingram, of London, and Mr. Gilchrist, of Edinburgh, was at last fulfilled, but too late for either of them to know.

Here the provost and his companions rested for ten years, but with the eviction of the Merchants in 1869 their wanderings began afresh. The flitting of the Merchants was a big job—

"muckle ado when burghers ride." As far back as their Briggate days they owned various treasures. They had pictures, many of which look down on us now from the walls of "Old Glasgow," effigies of ancient worthies who had done the House good service in life, or had swelled its funds at death; they had "the gilded broads with the names, designations and sums mortified for the use of the poor old members of the merchant rank . . . likewise a large written broad with Scripture directions how to buy and sell with a safe conscience;" and they had two antique bas-reliefs "all purely cut out of freestone," one of them figuring "three old men resembling the decayed members of the merchant rank," and the other, "a ship with full sails with the arms of the city," relics perhaps of that earliest "almous Hous biggit in the Briggait," which the magnificent structure of 1659 replaced. Besides these Briggate properties, the House now owned the Ingram bas-relief and other treasures that it had accumulated in two generations. On leaving Hutcheson Street they disposed variously of them. They hung the pictures in their new quarters in Virginia Street; they stored the broads (so far as forthcoming) with Bailie Morrison in Sauchiehall Street; the three bas-reliefs (which had been specially exempted from the conveyance to the Court House Commissioners) they sent to Mossman's yard to keep each other company and compare notes as to their adventures. Finally, when they broke up their bivouac in Virginia Street and marched to their permanent camp in George Square, they gathered round them all their treasures. They hung the pictures in the Hall itself and the broads in the Collector's office, and they built the bas-reliefs solidly into the walls. The three old men and the ship with full sails resumed the position they had held in the Briggate:—"The entry to the [Merchants'] Hall is very fine and splendid; above the top thereof are the two bas-reliefs." So M'Ure tells us; and so it has since been done. In Hall III. the two old bas-reliefs were fixed at the entry, and at the entry to Hall IV., very fine and splendid, Kirkman Finlay faces us in his marble toga, and the two old bas-reliefs are fixed right and left on the stair behind him, where one can pretty well make them out on a fine day in June. The Ingram bas-relief is visible every day of the year above the fireplace in the directors' room; the relief is cut deep and sharp in white marble; it has a modern frame of yellow marble, in keeping with the modern chimneypiece, and it bears the inscription:—

ARCHIBALD INGRAM, DEAN OF GUILD

1757-8—1761-2,

LORD PROVOST 1762-3.

Some years later Michael Connal, in hopes of a further find, hunted through the steeple in the Briggate, and, with some risk to life and limb, cleared the rickety ladders to the very top. I am sorry to say he drew the covert blank.

Of Archibald Ingram himself very little is known, surprisingly little for one so notable in his own day. I think he was not Glasgow born—there is no record of his family here, and Ingram is not a Glasgow name. He married Rebecca Glassford, sister of the great Virginian John Glassford, of Douglaston. The Glassfords were bien Paisley folk, and Ingram probably came from the suburb. Only one personal trait is recorded of him—"He was notorious for his niggardly disposition." So says Senex, but Senex's tongue was no scandal. Whatever he was personally, Archibald Ingram was one of those men who have given Glasgow a distinct lift up. He was the father of our printing trade. In 1742 he formed, in conjunction with his brother-in-law Douglaston and other leading merchants, the Pollokshaws Printfield Company, and under that firm founded our first printfield. He chose its site in a triangle of Nether Pollok estate lying between the White Cart, the Auld House (sometimes misnamed the Aloes) Burn and the Main Street of the 'Shaws, then a country road. Here he began in a small way and under many difficulties. He had to spin his yarns and weave his cloth, he had to train his bleacher and his colour mixer, and he had to steal his patterns. For years the company lost money, but Ingram persevered and extended and improved. First and last he feued from Nether Pollok nearly thirty acres Scotch, he changed the course of the burn and formed "reservoir, canals and rivulets"; he levelled and turfed a great bleaching green; he built "printing shops of hewn stonework covered with slate, copper-houses, boiling-houses, drying-shades, callendar;" he went on from the wooden block to the copper-plate, from the copper-plate to the copper cylinder; and he ended with a large and profitable business throughout Great Britain, Virginia, Maryland and the West Indies. Others followed his lead, and before the end of the century there were over thirty printfields in and around Glasgow. Outwith his printing business, Archibald Ingram was one of the founders of the Glasgow Arms Bank in 1750; he was Dean of Guild in 1757 and again in 1761; Bailie in 1753 and again in 1758; finally, in 1762 they made him Lord Provost. He died in 1770, leaving 20*l.* to the Merchants' House, 20*l.* more than he would have left them if he had known how they were to treat his effigy. Happily others

thought better of him. In 1781 the Town Council carried out the greatest town's improvement that had yet been attempted. They made the narrow, crooked Back Cow Lane into a fine street, wide and straight as the Trongate, and they called it "Ingram Street;" eleven years after his death they had not forgotten the father of our printing trade.

Scarce anything is known of Archibald Ingram's family. Rebecca Glassford survived him till 1774. I wish it had been till 1781. William Ingram, of the well-known firm of "Campbell & Ingram," insurance brokers, back of the Exchange; also, I think, of "Jack, Ingram & Co., broadcloth shop, Exchange No. 127," was probably the provost's son; Robert Ingram, of London, was certainly his grandson—*ceteri desunt*. None of his family seem to have carried on his own business, and in 1789 the Pollokshaws Printfield, reservoir, canals, rivulets and all, was brought to the hammer. The triangle it occupied has long since been broken up and turned to various uses. In the days when cotton was our rising industry a slice of it, the middle cut, seven acres of it, was bought for a cotton mill by John Monteith, of Anderston, son of old James Monteith, and Robert Dunmore, of Kelvinside, no doubt the moneyed partner. From them the 'Shaws Mill passed successively to John Monteith alone, to his brother Henry Monteith, of Carstairs, to W. & M. Hunter & Co., to J. & R. Cogan, all well-known men in their day. It now belongs to Lowndes, Macdonald & Co., manufacturers. It was in this mill that the powerloom was first used on any considerable scale. John Monteith ran 200 powerlooms there to good account. Thus the same triangle of Nether Pollok, which had given a start to our printing, gave a start to our manufacturing.

Not long before his death Provost Ingram undertook a difficult duty. On October 12, 1769, it was moved in the Merchants' House that the price of coals was lately risen to an excessive rate. The motion was carried *nem. con.*, and Provost Ingram and others were named a committee to consider and report "how the price of coals could best be lowered, and the inhabitants served with this necessary article on reasonable terms." Unfortunately the committee's report is not on record; it would be very handy just at present to know how to be served with this necessary article on reasonable terms. Yet I fear that the relief would at best be temporary. It is not easy to thwart the divine order by which supply and demand control prices—all prices, the price of coals and the price of winning coals; few provosts can do it; it is "aboon their micht;" nay, it taxes the powers of a Chisholm Robertson.

TESSERÆ.

Imitation of Greek Models.

DO we show our appreciation of the Greeks most wisely in attempting the mechanical reproduction of their forms, or by endeavouring to comprehend the thoughtful spirit of full-grown manhood in which they wrought, to kindle ourselves by the emulation of it, and to bring it to bear with all its plastic force upon our wholly new conditions of life and thought? It seems to us that the question is answered by the fact, patent in the history of all the fine arts, that every attempt at reproducing a bygone excellence by external imitation of it, or even by applying the rules which analytic criticism has formulated from the study of it, has resulted in producing the artificial and not the artistic. That most subtle of all essences in physical organisation, which eludes chemist, anatomist and microscopist, the life, is in æsthetics not less shy of the critic, and will not come forth in obedience to his most learned spells, for the very good reason that it cannot, because in all works of art it is the joint product of the artist and of the time. Faust may believe he is gazing on "the face that launched a thousand ships," but Mephistopheles knows very well that it is only shadows that he has the skill to conjure. He is not merely the spirit that ever denies, but the spirit also of discontent with the present—that material in which every man shall work who will achieve realities and not their hollow semblance. It is one of the marvels of the human mind, this sorcery which the fiend of technical education weaves about his victims, giving a phantasmal Helen to their arms and making an image of the brain seem substance. It is the grace of the Greeks, their sense of proportion, their distaste for the exaggerated—it is these that we should endeavour to assimilate without the loss of our own individuality. We should quicken our sense of form by intelligent sympathy with theirs, and not stiffen it into formalism by a servile surrender of what is genuine in us to what was genuine in them. "A pure form," says Schiller, "helps and sustains, an impure one hinders and shatters." But we should remember that the spirit of the age must enter as a modifying principle not only into ideas, but into the best manner of their expression. The old bottles will not always serve for the new wine. A principle of life is the first requirement of all art, but can only be communicated by the touch of the time and a simple faith in it; all else is circumstantial and secondary.

English Tapestry.

The introduction of tapestry-weaving into England is usually attributed to a gentleman named Sheldon, late in the reign of Henry VIII. Lady Wilton mentions indeed an intimation by Walpole of its origin as early as the time of Edward III.; but if any attempt was made to introduce the art at that time, it does not appear to have produced any important result. According to her "Art of Needlework," Sheldon allowed an artist, named Robert Hicks, to use his manor-house at Burcheston in Warwickshire for the practice of the art, and mentioned him in his will which was dated 1570, as "the only auter and beginner of tapistry and arras within this realme." At Burcheston were worked in tapestry on a large scale maps of Oxfordshire, Worcestershire, Warwickshire and Gloucestershire, some fragments of which were, it is stated, in Walpole's collection at Strawberry Hill. Little more is known of this establishment. James I. endeavoured to revive the manufacture of tapestry by encouraging and assisting in the formation of an establishment at Mortlake about 1619, under the management of Sir Francis Crane. James I. gave 2,000*l.* towards the formation of this establishment, which appears to have been originally supplied with designs from abroad, but subsequently by an artist named Francis Cleyne or Klein, a native of Rostock in the duchy of Mecklenburg, who was engaged for the purpose. This undertaking was a favourite hobby both with James and his successor, who regarded Cleyne so favourably that he bestowed upon him in 1625 an annuity of 100*l.* which he enjoyed until the civil war. In the same year Charles I. granted 2,000*l.* a year for ten years to Sir Francis Crane, in lieu of an annual payment of 1,000*l.* which he had previously covenanted to pay for that term as the grant recites, "towards the furtherance, upholding and maintenance of the worke of tapestries, latelie brought into this our kingdome by the said Sir Francis Crane, and now by him and his workmen practised and put in use at Mortlake in our countie of Surrey," and of a further sum of 6,000*l.* due to the establishment for three suits of gold tapestries. After the death of Sir Francis Crane, his brother Sir Richard sold the premises to the king, and during the civil war they were seized as royal property. After the Restoration Charles II. endeavoured to revive the manufacture and employed Verrio to make designs for it, but the attempt was unsuccessful. Lady Wilton, however, conceives that although languishing, the work was not altogether extinct, "for," she observes, "in Evelyn's very scarce tract entitled 'Mundus Muliebris,' printed in 1690, some of this manufacture is amongst the articles to be furnished by a gallant to his mistress." During its period of prosperity this manufacture produced the most superb hangings after the designs of celebrated painters, with which the palaces of Windsor Castle, Hampton Court, Whitehall, St. James's, Nonsuch, Greenwich, &c., and many of the mansions of the nobility were adorned. Five at least of the cartoons of Raphael, which appear to have been bought by Charles I. for that purpose, were worked in tapestry at Mortlake. These celebrated works were designed for the purpose of being copied in tapestry and were originally worked in Flanders. An Act of Parliament was passed in 1663 to encourage the linen and tapestry manufactures of England and to restrain the great importation of foreign linen and tapestry.

Walter Stukeley, the Archæologist.

No antiquarian ever had so lively, not to say licentious a fancy as Stukeley; the idea of the obscure remote past inflamed him like a passion; most even of his descriptions are rather visions than sober relations of what would be perceived by an ordinary eye; and never before or since were such broad continuous webs of speculation woven out of little more than moonshine. He possessed, however, a great deal of real ingenuity as well as learning, and all his works contain many things that are most curious and valuable, some of them much that would by this time have been irrecoverably lost but for his record of it, although few if any of either his theories or his histories are to be received throughout with implicit faith. His first antiquarian work was "An Account of a Roman Temple (the celebrated Arthur's Oven) and other antiquities near Graham's Dike in Scotland," 4to, London, 1720. This was followed by his "Itinerarium Curiosum, or an Account of the Antiquities and Remarkable Curiosities in Nature or Art observed in Travels through Great Britain," illustrated with copper plates, fol., 1724. A second volume, or "Centuria," as it is designated, was added to this work from the papers and drawings he left at his death ready for the press, and was given to the world, along with a reprint of the former volume, in 1776. It is of all Stukeley's works the one that is now most sought after. His next publications were his two works on the great druidical or supposed druidical remains in the West of England—the first entitled "Stonehenge and Abury, two Temples restored to the British Druids," fol., 1740; the second, "Abury, a Temple of the British Druids," fol., 1743. In 1743 also appeared his

"Palæographia Britannica," 4to. He produced nothing more except some communications to the "Archæologia" and the "Philosophical Transactions," till in 1757 he printed, in a separate tract, his account with extracts of the work of Richard of Cirencester, "De Situ Britannia," sent to him as having been recently discovered at Copenhagen, by J. C. Bertram; but a more extended account of this work is given in the second or posthumous Centuria of his "Itinerarium Curiosum," already noticed. In 1759 appeared, in a quarto volume, one of his most remarkable works, entitled "Some Account of the Medalllic History of Marcus Aurelius Valerius Carausius, Emperor of Britain."

Early German Æsthetics.

The word *æsthetik* was first used by Baumgarten, who considered beauty as a given property of objects, of which we are becoming sensible. We perceive beauty, says Baumgarten, wherever we meet with perfection manifested in reality, and a thing is perfect if it is adequate to its notion; beauty, accordingly, is the perfectness of an object manifested in its appearance. The impulse to a deeper research into the essence of beauty was given by Winckelmann, who, without embodying his views in a regular system, developed them chiefly in reviewing and appreciating the remains of ancient sculpture. He adopted neither Baumgarten's "adequateness of an object to its notion," nor the sensual principle which had been proposed by Edmund Burke as the criterion of beauty; but considered the idea of beauty as dwelling in the divine mind, and as passing over from that source into individual objects. Kant denied the possibility of a strict science of beauty, inasmuch as beauty, according to him, is not a property of objects, but has its origin in the disposition of our mental faculties. We pre-suppose, says he, that some notion is contained in the apparent object, though we are unable abstractedly to express that notion; we assume that a tendency towards some purpose has presided over the formation of the manifold variety displayed before us, though we cannot precisely define that purpose, and this supposition or assumption forms the basis of our perception of beauty. Schelling's view of beauty and art it is difficult to state concisely. His "system of transcendental idealism" establishes the principle that mind and nature, or conscious and unconscious existence, are primarily identical; that the laws discoverable in nature must accordingly be traceable to the laws of consciousness, whilst, *vice versa*, the laws of consciousness must admit of being recognised as being likewise the laws of nature; in the divine mind both exist in absolute identity. The artist is to produce in his mind an intellectual intuition analogous to this identity and the expression which he gives to the identity thus arrived at is the work of art. Beauty, according to Schelling, is that manifestation of the principle of art where the infinite appears contained in, or represented by the finite, or where, in the very object, the difference between the conscious and the unconscious (mind and nature) is annulled.

Variety in Roman Planning.

With the exception of the Erechtheum Greek temples were simple parallelograms, differing from each other as to plan only in the number and disposition of the columns around the cella. By the adoption of the circular form in their plans the Romans introduced an important element of variety into architectural design. Polygonal forms of plan were sometimes employed, of which there is an instance in what is called the Temple of Minerva Medica at Rome, which is circular on the exterior, but internally decagonal, with nine of its sides occupied by as many recesses, and the other by the doorway, a remarkable peculiarity, it being very unusual to enclose a polygon within a cylindrical structure, although not the contrary, nor to erect a cylinder upon a square or polygonal basement. Octagonal plans were by no means uncommon; such forms were frequently made use of for the saloons of public baths, and there is an instance of an octagonal temple, supposed to have been dedicated to Jupiter, in one of the courts of Diocletian's Palace at Spalato. Of hexagonal structures there is no example, but a court with six sides occurs in the remains of the Temple of Baalbec, not, however, a regular hexagon, but of elongated figure, two of the sides being 110 and the remaining four 88 feet each. In the later periods of Roman architecture, circular and polygonal structures became more frequent, and those of the first-mentioned kind deviated considerably from the original simple rotundas and circular temples. An inner peristyle of columns was introduced so as to make a spacious circular or ring-shaped ambulatory around the centre, which was much loftier than the colonnade, being covered by a dome raised upon a cylindrical wall over the columns. What is now called San Stefano Rotondo at Rome, supposed by some to have been originally a temple dedicated, first to Faunus, and afterwards to the Emperor Claudius, and by others to have been a public market, is a structure planned according to the arrangement just mentioned, with a circular Ionic colonnade of twenty columns and two piers. The church of Santa Costanza,

traditionally reported to have been a Temple of Bacchus, but now generally supposed to have been erected by Constantine as a baptistery, and afterwards converted by him into a funeral chapel to his daughter Constantina, is a remarkable example, owing to the columns being not only coupled, but unusually disposed, and to there being arches springing from their entablature—that is, there are twenty-four columns (with composite capitals) placed in pairs, on the radii of the plan, or one behind the other, forming twelve inter-columns and as many arches, and as far as the mere arrangement goes, this interior is strikingly picturesque, but it would be an improvement if the dome were in such case to spring immediately from the imposts of the arches, and the latter to groin into it, or at least were it to spring from the vertex of the arches.

The Irish Round Towers.

In external character all the Irish towers may be said to agree, since there is only one which does not taper, and in that case the tower is cylindrical throughout its entire height. It is nicely faced inside and out with coggle-stones, and filled up with rubble. Though all bear to each other the strongest family likeness, there are many striking differences in the mason-work and in the minor details. The stones in some are truly chiselled and closely and beautifully laid in fine cement. Some are only coarsely hammered, others merely faced, and of various shapes and sizes, but still well fitted to each other. Some towers are built of round coggle-stones. In all the mortar is as hard as the embedded stones. The above and various other little diversities prove that these remarkable structures were erected by various workmen and at divers times, and, as Giraldus Cambrensis says, "according to the manner of the country"; but this clearly implies that the era of their erection must have prevailed through a very long period. Their situation on hill or dale is equally variable, nor does any one circumstance respecting their situations seem to be common to all, except their immediate vicinity to a small and very ancient church, though in some instances this ancient building has been replaced by a more modern fabric. Though most of these round towers were evidently divided into storeys, yet Cashel tower is smooth, and even polished on the inside from top to bottom. That at Ardmore was plastered with a very fine white and durable cement. The divisions are usually formed by projecting ledges for the flooring joists, which, however, in some instances were inserted in square holes in the wall, where the ends were still visible not many years ago. On each floor there is one very small window, and immediately below the conical cap four windows may be traced in the greater number of towers. In one there are five and in a few six windows, and so many as eight appear in one or two of the towers, but this is the largest number hitherto observed. In three or four of these buildings no windows appear in the upper storey—only one small loop-hole—a convincing proof that they could not have been intended for campanili. In most of the towers the doors are at a considerable height above the ground, in one even 24 feet, in several 14, and in others only 8, 7, or 6 feet, but in none of them are there any traces to assist conjecture as to the mode of reaching those doors, except in those where the door is on the ground, or raised from it by a couple of steps. The height of these towers varies greatly, one being only 35 feet, while the loftiest is 120 feet, but the common range is between 80 and 100 feet. Some stand on circular bases, which form one or two deep steps round the tower. Thus Donoughmore has a two-step base, each step or plinth being composed of very large blocks of stone. The basement of Kell's tower is square and the stones are of great size. Kilree and Aghaviller, both in the county of Kilkenny, have circular plinths 14 inches deep, projecting 6 inches, and resting upon a square base formed of great blocks of stone. The tower of Clondalkin, about five miles from Dublin, stands on massive stonework, and St. Columb's tower, at Londonderry, rises from a vaulted crypt. So also does that at Oughterard, in the county of Kilkenny.

Architectural Proportion.

The only kind of proportions in regard to which positive directions can be laid down, and which are therefore prepared for all alike without other study than that included in the usual course of elementary instructions, are those which relate to columns, doors, windows, niches, &c. For all these, certain relations between height and breadth have been established, originating in convenience and fitness, and not in any abstract notions of geometrical harmony or beauty. Were the latter the case, the square and equilateral triangle would recommend themselves as the most perfect forms, the one for windows, the other for pediments. This is so far from being the case, that no kind of square apertures are admissible or capable of being rendered agreeable even where dictated by convenience, except for mezzanine windows, for if a window requires to be made of wide proportions, so as to approach a square, it must be divided into separate upright compartments or apertures, after the manner of what is called a Venetian window; other-

wise, even although its dimensions should not be such as to render a single aperture inconvenient, it would produce a disagreeable effect, and look like a mere glazed gap, or as a Gothic window of wide proportions would do without its mullions. With regard to arches, again, or rather the spaces or openings covered by them, the proportions that are pleasing in some cases are quite unsuitable for others; in spacious apertures of the kind, that is of considerable breadth as regards the other features, the proportions ought to vary little from a double square in height, or two circles inscribed within the aperture of which half of the uppermost one will be the outline of the arch, whereas in narrower apertures of the kind and in arched windows greater proportionate height is allowable. As in almost every other respect, Gothic architecture affords greater freedom and latitude, not only as regards the form of the arch itself, but also the general proportions of the entire voiding covered by it, which may be of lofty proportions in comparison with its breadth; but in the Roman or modern Greco-Roman style (where the arch is adopted together with the Grecian features and detail), other proportions than those above mentioned cannot very well be departed from, because the excess as to height which would produce the grandeur of loftiness would in the same degree occasion the effect of narrowness, narrow and lofty being almost convertible terms as regards proportion. There are cases in which propriety and fitness not only reconcile us to proportions that would else be positively disagreeable, but in which positive admiration is excited by what would in general be termed utter disproportion. Of this we have proof in bridges, where beauty and grandeur are occasioned by proportions that would be absolutely monstrous elsewhere, by arches of prodigious span or width, springing from exceedingly low piers.

The German Canaletto.

An example of the power of heredity is shown by the history of the Quaglio family. How long they have been connected with the arts in Italy is unknown. One member belonged to the school of Tintoretto, and was appreciated as a painter of altar-pieces in Austria. His son Julio was a frescoist. Giovanni Quaglio was engineer and architect in the Imperial service at Vienna. His son Lorenzo designed many buildings in Germany. A son of the latter was an architectural and scene painter. Another of Giovanni's sons, named Domenico, was a historical painter. He left two sons, Julius, an admirable scene painter at Munich (died 1800), and an elder son, Joseph (died 1828), who was even more eminent than his brother, both as a scene painter and in decoration generally. Joseph had four sons, Angelo, Domenico, Lorenzo and Simon. Angelo was also a scene painter of extraordinary genius, and some of his productions are described as having had a most astonishing effect, particularly one representing the illumination of St. Peter's at Rome, after studies made by him on the spot. Domenico, who was called the German Canaletto, was born at Munich in 1786, and began at a very early age to manifest a fondness for art, especially for perspective and architectural painting. With his father for his instructor, and with his own instinctive feeling to urge him on, he not only made rapid proficiency in the above-mentioned studies, but devoted his leisure to drawing from the life model, to landscape and sketches from nature, and to etching and engraving. In fact, he was in some danger of aiming at excellence in too many departments of art, had he not, by the advice of his brother Angelo, determined to devote himself more especially to one. Having imbibed a strong taste for the architecture of the Middle Ages from Angelo's own drawings of the cathedral of Cologne (made for Sulpice Boisserée's splendid work), he resolved to make the buildings of that period the chief subjects of his pencil. With this view he made an architectural tour to Freising and other places, studying their interesting monuments of Gothic architecture. These furnished him with a stock of subjects for paintings on his return, and among the rest for his picture of Regensburg Cathedral, which was purchased by Maximilian, the King of Bavaria, who exhorted the artist to confine himself to the new branch which he had so successfully commenced. Following this advice, which was seconded by that of many other able judges, Quaglio resigned, in 1819, his situation and salary as scene painter at Munich theatre, and thenceforth applied himself solely to architectural painting, in which branch of art he gradually established a reputation throughout Europe, and at the same time was not a little instrumental in promoting by his works that taste for the architecture and arts of the Middle Ages which has of late years taken root in Germany. Independently of their value as portraits of some of the finest productions of German-Gothic architecture, his works are marked by striking picturesque effect. Besides his pictures, which are very numerous, he executed many etchings and lithographic views, and among the latter a series of thirty subjects, entitled "Denkwürdige Gebäude des Deutschen Mittelalters." In 1829 he accompanied Mr. Gally Knight in a tour to Italy as his architectural draughtsman. He died at Hohenschwangau (where he was employed in restoring and improving the castle), of an apopleptic attack, April 9, 1837.

NOTES AND COMMENTS.

A SCHEME of improvement for the slums of the Fountainbridge district, Edinburgh, prepared by the burgh engineer, is now under the consideration of the Town Council. It is proposed to widen several of the streets. The cost of the whole scheme cannot well be estimated at present, but the more important works comprising the removal of the canal and formation of new basins and wharves and loading bank; the utilisation of its site for streets and building plots; the widening of Fountainbridge; the formation of extended and widened Semple Street; the formation of a new street at Port Hamilton from Morrison Street to Fountainbridge; the connection of Gilmore Place and Fountainbridge—including the paving and drainage of such new streets—is estimated to cost 301,008*l*. On the other hand, sites for buildings and workshop yards worth 158,228*l*. would be available without delay, thus leaving the net cost as 142,780*l*. The majority of visitors to Edinburgh are not well acquainted with Fountainbridge, and it could not be recommended to invalids. The long narrow thoroughfare leads to slaughter-houses, manufactories and other places where disagreeable operations are carried on. In all large cities drawbacks of the kind are inevitable, but in Edinburgh they contrast painfully with the general character of the city.

THE competition for the "Owen Jones" Prize has been decided. The prize was instituted in 1878 by the Council of the Society of Arts, as trustees of the sum of 400*l*., presented to them by the Owen Jones Memorial Committee, being the balance of subscriptions to that fund, upon condition of their expending the interest in prizes to "students of the School of Art who, in actual competition, produce the best designs for household furniture, carpets, wall-papers and hangings, damask, chintzes, &c., regulated by the principles laid down by OWEN JONES." The prizes are awarded on the results of the annual competition of the Science and Art Department. Six prizes were offered for competition in the present year, each prize consisting of a bound copy of OWEN JONES'S "Principles of Design," and a bronze medal. The following is a list of the successful candidates:—FRED. APPELYARD, School of Art, Scarborough—Design for wall-paper; ERNEST G. GILICK, School of Art, Nottingham—Design for lace curtain; ERNEST G. SLATER, School of Art, Scarborough—Design for a damask; CONSTANCE T. SMITH, School of Art, Glasgow—Design for a printed velvet; EDWIN FRANCIS, School of Art, Durham—Design for a carpet; SAMUEL PALMER, School of Art, Macclesfield—Design for floor tiles. The next award will be made in 1895, when six prizes will be offered for competition.

THE account of his experiences in Ireland which the late W. R. LEFANU published was so mirthful, we are sure every reader desired that the author would benefit the world by relating more of the same sort. Unless he completed a second collection that desire is vain, for Mr. LEFANU has joined the men whose foibles he described. Many an amusing story could have been told at his own expense, but this is not the time. Mr. LEFANU was a pupil of the late Sir JOHN MACNEILL, a civil engineer who held a monopoly of railway work in Ireland. It was his fate to be dethroned by his pupils. LEFANU acquired the work in the south, HEMANS in the west, BARTON in the north, the eastern part was shared between the three. His college professorship was also practically withdrawn from him. Mr. LEFANU became chief engineer to the Great Southern and Western Company. Mr. HEMANS obtained a similar position with the Midland Great Western Company. Each of the companies possessed a merchant for chairman, and one regarded the other as an enemy. Almost every year there was a duel between them in Parliamentary committee-rooms. Between the two main lines of railway there was a large tract of country, and the endeavour was to get possession of part of it. There could be no better arrangement for the advantage of the engineers, although the contests were not profitable to the shareholders. After a time the chairman died; his successors were not belligerent, and applied the *Cui bono?* test to Parliamentary warfare. Mr. LEFANU, finding his occupa-

tion gone, accepted a commissionership of public works, to the amazement of all engineers, for that office was reserved for broken-down military men, surveyors, road-makers, valuers, with an occasional briefless barrister. However, there was one advantage for a gentleman like Mr. LEFANU, the office afforded leisure for fishing. Nor was he left to repose. The edict by which men of the age of sixty-five were supposed to be incapable to enjoy official posts that were originally intended as a solace for old age was applied to Mr. LEFANU, and he was forced to retire from as pleasant a position as is to be found in the Civil Service of any country, and one, too, which afforded abundant materials for a story-teller. He utilised his leisure for the preparation of his admirable book, and it is to be regretted that a writer so competent did not live long enough to exhibit his humour repeatedly. In these dull days his gift was as beneficial as the Samaritan's oil.

IT is sometimes said that if a young architect assaulted a contractor who was faithfully adhering to the specification he would be likely to become a success, but on condition that he was summoned and fined. The next best course would be to assault obnoxious materials and take the chance of a prosecution. For it is not legal to destroy another man's property, and materials which are unsuitable in one place can be turned to account elsewhere. The architect's business is simply to reject materials when he cannot approve of them. A case relating to the subject is now before the New York courts. According to the *American Architect*, Mr. WALTER PARFITT, architect, who has been building a church in Brooklyn, found some stones used in the church which, as he testifies, had already been rejected and condemned, as unfit for use. He made sure of his directions being followed for the future in regard to them by getting a hammer and smashing them. The contractor sued the architect for destroying his property, and a commission allowed him some 1,400 dols. The present suit is brought to have this award set aside, the architect claiming that the stones were destroyed by him in pursuance of his duty in defending the structure against danger, and after due warning to the contractor. The judge left the case for consideration, so that we do not yet know the result; but as the points involved relate to the extent of an architect's powers in compelling compliance by contractors to his directions, the judgment will be looked for with interest. There is a story, whether authentic or not we cannot say, which relates that an owner found that a wall in his new house was being built with bond-courses only every ninth course in height instead of every seventh course, as required by the contract, and knocked it over with a piece of heavy timber, and was sustained by a court in doing so; and if it is lawful for an owner to destroy without warning a wall which is a little less perfectly bonded than the contract requires, it must be still more lawful for him to destroy after due warning stones which constantly menace the whole structure; and if an owner could do so there is certainly ground for claiming that his architect, who is unquestionably his agent for averting obvious peril to his building, not only could but should take in emergency such measures as the case seemed to him to require. Whether the New York court will hold this view remains to be seen, but New York courts have, particularly as compared with those of some of the agricultural States, a very good understanding of the relations of architects to owners and contractors.

A FRENCH painter, M. RICHARD PARAIRE, has returned to Paris after spending a year on the Ivory Coast. He made several explorations, and has brought back a multitude of drawings and sketches. M. PARAIRE is to hold an exhibition of his works in the course of the winter, and, as his countrymen have of late years become interested in Africa, it is likely to be successful. About its novelty there can be no question.

IT is said that an English company contemplate the construction of a hippodrome in Paris. In size it will be as large as the old one, which was recently abandoned. It will have an advantage over its predecessor, as it will be erected in the centre of Paris, and not far from the Opera House.

CHURCH OF ST. AGATHA, FOR THE WINCHESTER COLLEGE MISSION, PORTSMOUTH.

THE drawing which we reproduce in this issue was exhibited in the Royal Academy Exhibition of the current year. The church is in course of erection in a very poor part of Portsmouth, where the Rev. R. R. DOLLING, missionary, has worked for some years. The style adopted is that of the Basilican churches of the Lombard type, which secures uninterrupted view of the altar to a large congregation. The church when completed will seat some 1,250 people. It is proposed at present to complete the nave and south aisle, which will seat about 800, at a cost for the structure of 6,200*l.*, but contracts have been obtained for its completion with all fittings and finishings. The south aisle is arranged as a complete chapel large

JOHN FLAXMAN.

THE father of Flaxman was a modeller and dealer in plaster figures. At the age of fifteen the son became a pupil at the Royal Academy, after having sketched many designs of much merit. While yet a boy, he had the advantage of receiving the kindly aid of many accomplished women of that time, among whom were Mrs. Matthew, Mrs. Chapone, Mrs. Montagu and Mrs. Barbauld. But before he attended as a pupil at the Academy, he had sketched a number of subjects from Homer and other classical writers, which he had heard read at Mrs. Matthew's house; among these were six executed in black chalk:—The Blind *Cædipus* conducted by Antigone to the Temple of the Furies; *Diomedes* and *Ulysses* seizing *Dolon*; the Lamentation of the Trojans over the Body of *Hector*; Alexander taking the Cup from Philip, his Physician; *Alcestis* taking leave of her Children; and *Hercules* releasing *Alcestis*. His first model, in wax, was produced at the Royal Academy in 1770, and from that period he studied and worked fifty-seven years as a sculptor. During the years which passed while and soon after Flaxman studied at the Academy, he was more

enough for daily services. The architect is Mr. J. HENRY BALL, A.R.I.B.A., of London and Southsea, and the contractors Messrs. W. R. LIGHT & SON, of Portsmouth.

STREET CORNER IN WOKINGHAM.

THE double-page illustration given this week is a reproduction of a sketch exhibited at the Royal Academy this year by Messrs. CHARLES SMITH & SON, architects, Reading.

The building was erected some time since at Wokingham, Berks, and is constructed with local grey brick facings and red brick dressings and strings. The stonework is of Box ground Bath. Messrs. SPEAR & KING, of Crowthorne, Berks, were the builders employed to carry out the work.

PAINTED AND SCULPTURED DECORATION.

Mr. L. Collmann, the inspector of furniture at Windsor Castle, has prepared a guide to the building and collections.

noted for his sketches than his models; and he was regarded rather as one who would some day rise to eminence than as one already great. The pecuniary resources of himself and his father were but small, and he found it desirable to accept an offer from the liberal and enlightened Wedgwood, to prepare designs and models for the porcelain which that energetic manufacturer was then bringing into vogue. Flaxman gave to those designs a grace, beauty and classical simplicity which had never before been exhibited in such works in England; and at a much later period, when at the zenith of his fame, he alluded with just pride to those productions of his earlier years. In this kind of employment, and in making sketches and models for employers once now and then, he maintained himself from his twentieth to his twenty-seventh year, employing his evenings in sketching designs (which seems to have been his great delight) from the Bible, "Pilgrim's Progress," Homer, and poets of various countries and ages. During this period he exhibited at the Royal Academy models of Pompey after his defeat of Pharsalia; Agrippina after the death of Germanicus; Hercules with Dejanira's poisoned Shirt; Acis and Galatea; and the Death of Julius Cæsar.

Flaxman went to Rome to study in 1787, being then thirty years of age. He had been partly impelled to this step by a cold and much-criticised remark of Sir Joshua Reynolds

who, hearing that Flaxman had married, said, "Then you are ruined for an artist." Flaxman, who had married a lady in every respect worthy of him, determined to falsify Reynolds's prediction by studying until he had reached a lofty position in art. During the intervening period, before his departure from England, he produced a few works in sculpture. One of these was a monument of Collins the poet for Chichester Cathedral; a second was the monument to Mrs. Morley, in Gloucester Cathedral; another was a monument to the memory of Miss Cromwell. All these exhibited a strongly religious feeling in the conception and treatment of the subjects; and it was one of the guiding principles of Flaxman, often acted on in after-life, that "the Christian religion presents personages and subjects no less favourable to painting and sculpture than the ancient classics." When he was at Rome he saw how vividly the devotional spirit of the Church had drawn out the talents of the Italian artists in productions suitable to the tenets of that Church; and he conceived the opinion that the Protestant doctrines, if treated with taste and discrimination, were no less susceptible of engendering fine works of art.

While at Rome Flaxman divided his time between the pursuit of such studies as should qualify him for the lofty position which his genius marked out for him, and in such works as should in the meantime support him. It was while at Rome that he produced the series of designs which have made his name known throughout Europe, more even than his works in actual sculpture. These designs were from the writings of Homer, Æschylus and Dante, for three English employers—all conceived in a spirit which fitted them to be embodied in marble, though such an embodiment has not yet been accomplished. From the "Iliad" there are thirty-nine illustrations, of which twenty-seven are so chosen as to contain female figures as a means of softening the stern character of other parts of the poem. Mr. Allan Cunningham, in his "Life of Flaxman," describes many of these, and says generally of Flaxman's mode of treating them, "His taste was with the beautiful as well as with the stern—and it was thus he sought to soften down and relieve the scenes of carnage and peril with which the fiery epic abounds. He has varied his illustrations with great skill, and displayed everywhere a fine sense of the harmony of composition. All is grave, severe, simple; he has admitted nothing that is mean or merely ornamental; the beauty of form is subordinate to the sentiment; his heroes have no taint of brutality, nor his beauties of levity." Another set of designs were from Homer's "Odyssey," thirty-four in number, not less masterly in composition than the former. The third series consisted of illustrations of Dante, comprising no fewer than a hundred and nine sketches from the "Divina Commedia" of that poet. The three parts of that extraordinary poem relate respectively to Purgatory, Hell and Paradise; and Flaxman made his designs in about equal numbers from these three sections. These drawings are wonderful productions. The critic lately quoted said concerning them:—"In the illustrations of Homer, Flaxman was guided by ancient works of art as well as by the poet's verse; but the subject now presented to his fancy wanted wholly the former species of emblazonment; its images were as yet unembodied in marble, and the antique character of face would have been manifestly out of keeping with modern princes and poets and warriors. I cannot help, therefore, regarding his Dante as a more original work in every way than his Homer; that it is, on the whole, less popular may be ascribed to the difference of fame in the poems themselves, for all who are intimately acquainted with the subjects will feel that he has come nearer to the illustrious Italian than to the unrivalled Greek."

It frequently happens that the works which bring most fame to an artist after his decease are those for which he is most humbly paid while living, and, as an illustration of this, it may be said that Flaxman received less than a guinea apiece on an average for these original and beautiful sketches. They, however, immediately brought him into note, and he executed various commissions during the seven years spent at Rome. He produced for Mr. Hope a small marble group of *Cephalus and Aurora*. For the Earl of Bristol he sculptured a group from Ovid's "Metamorphoses," relating to the Fury of Athamas, comprising four figures larger than life. From this commission he is supposed to have actually lost money by the insufficient price paid for it.

On his return to England, Flaxman found Banks, Bacon and Nollekens in full and profitable employment. While yet at Rome he had been commissioned to sculpture a monument to Lord Mansfield, now in Westminster Abbey, and this was one of the first works which he completed and exhibited on his return. Soon after this he presented to Mrs. Flaxman, on her birthday, a book full of exquisite original sketches by his own hand, comprising forty designs illustrative of the Christian virtues and their antagonist vices, forming a kind of allegory something like "The Pilgrim's Progress." Mr. Allan Cunningham describes these designs at full, and then says, "To publish an engraved facsimile of this book would be conferring a benefit on mankind."

In 1797 he was elected a Royal Academician, and in the same year exhibited three sketches in bas-relief from the New Testament, comprising the subjects of Christ raising the daughter of Jairus, an embodiment of the words "Comfort and help the weak-hearted," and another, "Feeding the hungry." After producing a bas-relief monument to Sir William Jones and one or two other works, he made a proposal to Government when a grand national pillar was talked about, to make a statue of Britannia 200 feet in height, but the magnificence of the scheme did not meet with a response. This rejection even did not prevent him from being employed in a rapid succession of works. One of these was a monument to the family of Sir Francis Baring, in which the two Christian texts of "Thy Kingdom come" and "Deliver us from evil" are embodied with a loftiness and devotion of feeling which few sculptors seem to have had equal to Flaxman. It was his custom in funeral monuments to embody texts from Scripture in this way. One on a monument to Miss Lushington illustrated the passage "Blessed are they that mourn." Other instances related to "Come, thou blessed," "Lead us not into temptation," and "Faith, Hope and Charity."

In the remaining years of his career he executed many public monuments and statues, such as that to Lord Howe, a statue of Sir Joshua Reynolds, another of Sir John Moore for Glasgow, another of William Pitt for the same city, and others of Joseph Warton, George Stevens, the Rajah of Tanjore, the Missionary Schwartz, Lord Cornwallis, Warren Hastings and the Marquis of Hastings. In the midst of all these labours he pursued what seems to have been the chief delight to him in the domain of art, viz. the embodiment of stories from poets and classical writers, and light sketches fitted for being wrought into bas-relief, but left by Flaxman simply in the state of drawings. We have already named the "Iliad," the "Odyssey" and the Dante series, comprising altogether about two hundred designs, and to these may be added forty designs from "Oberon," thirty-six from Hesiod, others from "The Pilgrim's Progress" and others again from Æschylus; so that there were three ancient poets, Homer, Hesiod and Æschylus, and three modern poets, Dante, Bunyan and Wieland, whose works have been graced by the pencil of Flaxman, besides very numerous passages from the Bible.

Among his principal works in sculpture was a group of the Archangel Michael vanquishing Satan, a fine specimen of expression and grandeur. Another was a figure of Psyche, another Apollo, others statues of Raphael and Michel Angelo.

One of his most original productions, perhaps, was the Shield of Achilles, made for the eminent goldsmiths Messrs. Rundell & Bridge. The application of art to poetry, in respect to this celebrated shield, is highly curious. Achilles, as is pretty well known, is one of the chief heroes of Homer's "Iliad," one of those semi-divine, semi-human personages, whom it is difficult to identify historically with any definite era. In one part of the "Iliad," Homer describes the shield belonging to Achilles; and the description is so wonderfully minute that it is difficult to shake off the idea that a real shield was before him when he wrote; but from the whole circumstances of the case, it seems more likely that he owed to his rich imagination the creation of this work of art. As no pictures or sculptures relating to this shield were left by the ancients, modern artists have no means of forming a conception of it but from Homer's description. Quatremère de Quincy, Pope and Boivin have all sketched a shield, such as they believe would correspond with the minute description given by Homer.

When Flaxman entered upon his task, he examined all that had been done by others, and then formed his own conception of the best mode of embodying the description of the great poet. The result was the production of a magnificent work of art, about 3 feet in diameter; the convexity of the shield is about 6 inches; the number of figures introduced is upward of a hundred, and the degree of relief varies from the smallest visible swell to about half an inch. When the drawing and model were completed, Flaxman received from the enterprising goldsmiths about 600 guineas for his labour. Four copies of this shield, in silver-gilt, valued at 2,000 guineas each, were made for George IV., the Duke of York, the Duke of Northumberland and the Earl of Lonsdale; two casts in bronze were made for the proprietors themselves, and a few casts in plaster were prepared for other parties.

Cunningham sums up Flaxman's talents as a sculptor by saying:—"Of his works there are four kinds—the religious, the poetic, the classic and the historical. In each of these he has left specimens which give him high rank amongst the sons of genius, but in all of them he has not attained the same degree of excellence. In the historical he was embarrassed with the unpoetic costume of these days of buttons and capes; in the classic he was compelled to obey the antique; but in the poetic and the religious he has been surpassed in purity and simplicity by no modern sculptor." The historical series comprise a considerable number of works, but, from the reasons before stated, he did not particularly excel in them. "Generals, with their tassels, tags, orders and epaulettes; aldermen, with their

confirmed gout, corporation buttons and civic wigs; bishops, with their lawn-sleeves, and ladies, with their puckered gowns, spangles and trinkets, suited ill with the poetic Flaxman."

ARCHÆOLOGICAL EXCURSION.

THE members of the Upper Norwood Athenæum have just made their eighth excursion of the eighteenth summer season, when, under the guidance of Mr. W. F. Potter, architect, they proceeded by the South Eastern Railway to Abbey Wood, where, by kind permission of Mr. H. Pease, the scanty remains of Lesness Abbey and the spacious Tithe Barn were visited. The Barn, which is occasionally associated with the name of Wolsey, is quoted by Mr. John Harris as being coeval with the monastery. Its length is 150 feet and its breadth 40 feet; a little wider, but considerably shorter than the splendid specimen still standing at Harmondsworth. Although in 1662 Sir William Boreman is credited with having removed six hundred elms and chestnuts from Lesness to replant in Greenwich Park, the woods still form a picturesque background to the Abbey Farm. From Lesness a walk was taken to Erith Church, where the altar tombs, the brasses to a servitor of the abbey and others, and the mural monument by Chantrey were examined; and then after climbing the hill a pleasant half-hour was spent among the weather-beaten mariners in Belvedere House, where in the mess-room one may still admire the inserted wall-paintings by Angelica Kauffmann. At the Belvedere Hotel, after tea, Mr. Potter read the following interesting paper, which was acknowledged in complimentary speeches by Mr. Wheeler, Mr. Hayward, Mr. Findlay and Mr. Pound, who had previously alluded in tender terms to the death of Mr. Jones, the senior vice-president.

Erith and Lesness Abbey.

Erith, Ærrehythe, is the Anglo-Saxon for Old Haven; this at once denotes the great antiquity of the place. It is situated in a gentle bend of the river Thames, which along here for some considerable distance was embanked up on both sides by the Romans. In it Celt, Roman, Saxon and Norman have, says Mr. John Harris, left traces of occupation—the Celts in their earthworks and probable riparian village. The church was restored in 1877, when part of the south-west wall had become ruinous, exposing the centre or core. It was found to be constructed with rubble embedded in mortar containing pounded tiles, which the late Mr. C. Roach Smith asserted to be Roman. Fragments of Roman tile had been found in the south wall of the church. All this would indicate the existence of a former building. Hasted says Erith in the time of the Saxons was possessed by Azor de Lessneis.

Lambard, the old Kentish historian, thus writes:—"A rich man, anno 970, being owner of Cray, Erith, Ainesford and Woldham, and having none issue of his body, devised the same lands (by his last will, made in the presence of Dunstane and others) to a kinswoman of his owne for life, the remainder of the one halfe thereof, after her death to Christe's Church, at Canterbury, and of the other halfe to Saint Andrewes, of Rochester, for ever: he died, and his wife took one Leofsun to husband, who outliving her retained the land as his own, notwithstanding that by the forme of the devise his interest was determined by the death of his wife; hereupon complaint came to one Wulsie, for that time the Scyremen, or Judge of the countie, before whom bothe Dunstane, the Archbishop, the parties themselves, sundrie other bishops, and a great multitude of the lay people appeared, all by appointment at Earith, and there in the presence of the whole assembly Dunstane, taking a cross in his hand, made a corporal oath upon the booke of the Ecclesiastical Laws, unto the Shyreman (which then tooke it) to the King's use, because Leofsun himself refused to receive it), and affirmed that the rights of these lands was to Christe's Church and to Saint Andrews. For ratification and credit of his oathe a thousand other persons, chosen out of East and West Kent, Eastsex, Middlesex and Sussex took their oathes also upon the crosse after him. And thus by this manner of judgment Christe's Church and Saint Andrews were brought into possession and Leofsun utterly rejected for ever."

William the Conqueror gave Lesness, among other great possessions in this county, to his half-brother Odo, Bishop of Bayeux and Earl of Kent, under the general title of whose lands it is entered in Domesday Book:—"Robert Latin holds of the Bishop (of Baieux) Lesness. The arable land is 17 carucates. In demesne there is one, and 60 villeins, with three borderers, having 15 carucates. There are two servants and three cottages, and three fisheries of four sulings and 30 acres of meadow: wood for the pannage of 20 hogs. In the time of King Edward the Confessor it was worth 20*l.*; when the bishop received it 18*l.*, and now 22*l.*, and yet he who holds it pays 30*l.* This manor was taxed in the time of King Edward the Confessor at ten sulings and now at four sulings. Azor held it."

Upon the disgrace of the Bishop of Bayeux, the king, his brother, seized all his lands, by which means the fee of this manor again became vested in the Crown.

Richard de Lucy, Chief Justice of England, possessed the manor of Erith in the reign of King Henry II. He founded in 1178 an abbey of Canons Regular of the order of St. Augustine at Westwood (now called Abbey Wood) in his village of Lesness.

From the Lucys, the manor of Erith descended to the Earls of Athol. John, Earl of Athol, in the reign of Edward I. being concerned in the death of John Cummin (or Comyn), and the crowning of Robert Bruce, King of Scotland, and being taken in England, he was by Edward I., who was much enraged at that transaction, sentenced to death, November 7, 1305, but in respect of his descent from royal blood, he was not drawn as traitors usually are, but was set on horseback and hanged on a gibbet 50 feet high; his head was fixed on London Bridge and his body burnt. Upon which this manor came into the hands of the Crown, and was given by the king that same year to Margaret, Queen of England.

The manor next passed into possession of the family of Mortimer. Roger Mortimer was executed (for complicity in the murder of King Edward II.) at a place called the Elms, near Smithfield. Edward Mortimer, Earl of March, married Philippa, daughter and heiress of Lionel, Duke of Clarence, third son of King Edward III., from which circumstance his descendants afterwards claimed the Crown.

He died seized of the manor of Erith, with its appurtenances, together with the passage over the river Thames there. Edmund Mortimer, the last Earl of March, of this family, was kept by King Henry IV. in close custody, owing to his having a prior claim to the Crown. Richard Plantagenet, Duke of York, in the third year of Henry VI., on the death of his cousin Edmund Mortimer, the last Earl of March, and without issue, was found to be his heir, and as such became entitled to the "manor of Erythe."

He became the leader of the Yorkist or White Rose party, and gained many advantages in the Wars of the Roses, but was eventually slain in the battle of Wakefield. His head was cut off and fixed on the gates at York, and by order of Queen Margaret of Anjou, a paper crown was placed upon it in derision of his claim to the Crown of England.

His eldest son Edward, however, triumphed at the battle of Barnet, and was crowned King Edward IV.; he was possessed of the manor of Erith, which remained part of the royal revenue till the thirty-sixth year of King Henry VIII., who granted it to Elizabeth, Countess of Shrewsbury, by the description of "the manor of Erith, *alias* Lysnes"; her monument is the principal one in the church. In the fourth year of Queen Elizabeth this countess levied a fine on this manor with the passage over the Thames, and died 1567. The manor next passed into possession of the Lords Compton and other families till 1734, when it passed into that of the Wheatley family, whose memorials may be seen in the lady chapel, now called the Wheatley Chantry.

Henry VIII. granted among other lands "to Thomas Arderne, of Feversham in Kent, all those marshes belonging to the manor of Lyesnes, in the parishes of Lyesnes, Erith, Bexley, Plumstead, Dartford and Crayford."

Early in the reign of Henry VIII. Erith sprang into temporary naval importance as a dockyard, and it has sometimes been said that the great ship *Harry Grace de Dieu* was built here in 1515; this is now disproved by a document relating to the building of the ship, preserved at the Record Office. She was built at Woolwich, 1515, and victualled at Erith.

Erith Church.

In the sixteenth volume of the Transactions of the Kent Archæological Society are two excellent papers on this church; one is written by Mr. F. C. J. Spurrell, and the other by Mr. John Harris, both of Belvedere. Mr. Spurrell says:—"There was a church in Erith in Edward the Confessor's day; it is mentioned in a deed of that king, and also in another of William the Conqueror, but it is not mentioned in Domesday, and it is not mentioned in documents again until Stephen's reign. In this interval the church was doubtless destroyed, and rebuilt at the end of the eleventh or beginning of the twelfth century. This is in accord with the Norman architecture of the chancel. The tower was built in the fourteenth century. There was evidence all over the church of three, or four, or five coats of painting. A rude picture of the Crucifixion in outline was on the eastern pier of the arch on the north side of the chancel; and another like it under the opening into the rood-screen in the church. What remained of the painted glass was utterly destroyed by the gunpowder explosion on October 1, 1864, with much else. Some of the corbel heads are grotesque, but two are not—a queen and an angel. One grotesque is very remarkable; its date is Early English. It represents, projecting into the church, a terrible wolf-like gaping head, with mouth held distended by delicately shaped human arms and hands. The teeth are regular and human, the hair

is strongly waved, and evidently of feminine length. Mr. Spurrell adds:—"Altogether it represents what I understand to be the united characteristics of the northern deities, Heta and Fenis." A stone coffin of Transition or Early English date, and possibly earlier, is now in the lady chapel. On the lid is a cross with plain trefoiled ends. It very likely came from Lesness Abbey.

It was used to form part of the steps which once led down to the church in the south entrance, and very likely was used in repair in the time of Weever, the author of the "Funeral Monuments," who was rector of this church, and probably he secured some of the materials from Lesness Abbey (the founder's vault, &c.) in 1680, at which operation he was "not the hindmost," as he says himself. Another piece of a coffin-lid, containing a floriated cross of the fourteenth century, lies with it. Mr. Spurrell's paper has three illustrations, one showing the north wall of chancel before the new addition was built to it in 1877.

Mr. John Harris's paper is a description of the monumental inscriptions in the church and other objects. Not the least interesting of these are the masons' marks on the jamb of the south door. The old sundial on the exterior of the south wall has two scrolls. One states that the dial was given in 1648 by Nicholas Stone. The other scroll bears an inscription, "Redibo, tu nunquam," filled in by the late vicar, Archdeacon C. J. Smith, who translated it, "I shall come back; thou never." Weever, in his "Funeral Monuments," records many brasses and inscriptions once existing here.

The oldest brass formerly in Erith Church is a small strip with black letter inscription in Norman French, now in the possession of Mr. Spurrell; it runs thus:—" + Felice atte Cok gist icy—Dieu de sa alme eit merci" (Felice atte Cok lies here—God have mercy on her soul). Dr. Thorpe, in his "Monumental Records of Kent," published 1769, gives an inscription of a later date. Mr. John Harris describes all those in the lady chapel, now called the Wheatley Chantry. Here is also the monument to Elizabeth, Countess of Shrewsbury, already alluded to, and it is by far the finest in the church.

The early parish registers were almost all destroyed by fire on February 21, 1877, in the temporary wooden church used during the restoration of the parish church. Fortunately, in the autumn of 1876 copious extracts had been taken for genealogical purposes by Mr. Robert Hovenden, of Croydon, and his friend, Dr. Howard. The baptismal extracts ranged from 1625.

The church is 85 feet long by 70 feet broad, and is dedicated to St. John the Baptist. The chancel, 33 feet by 16 feet, is the oldest part of the building. A new north aisle, 50 feet by 21 feet, was added in 1877, when the old vestry was removed for this. A new porch was built at the south door; the tower, 14 feet square inside and 40 feet high, was almost entirely rebuilt, and a peal of eight bells was completed by the addition of two to the older six. In the church is a flagon, 13½ inches high, inscribed, "The gift of John Wheatley, Esq., to the parish of Erith, in the county of Kent; Easter 1737."

By virtue of a commission of inquiry into the value of church livings, dated March 29, 1650, issuing out of the Court of Chancery, it was returned that "Earith was a parsonage which was an impropriation belonging to Sir Thomas Thynne, Knt., and that there was in the parish a vicarage presentative with cure of souls, and was worth 50*l.* per annum with the glebe land, which was worth 1*0**l.* of the said 50*l.*"

John Weever, the author of the "Funeral Monuments," was possessed of this rectory at the latter end of the reign of Queen Elizabeth.

Archdeacon Charles John Smith, in his charming "History of Erith," published in 1873, says, "The old elm of the churchyard is 22 feet in girth, and the ivy here was 4 feet 9 inches in circumference at its stem."

Lesness Abbey.

This abbey as already stated was founded in 1178 by Richard de Lucy, Lord Chief Justice of England in the reign of Henry II., and during the king's absence in France, Regent of the kingdom. He sided with the king in his quarrel with Archbishop Thomas à Becket, and drew down upon himself a sentence of excommunication from that offended prelate. He died July 14, 1179, and was buried "under a sumptuous monument in the choir of his church here" (in the abbey), according to Hasted. Godfrey de Lucy, a near relative of the founder and Bishop of Winchester (1189), was a great benefactor to this house. It was ultimately suppressed by King Henry VIII., who on February 8 in the seventeenth year of his reign, granted the several suppressed monasteries of Lesness, Tunbridge, Begham (now called Bayham) and Calcote, together with all their manors, lands and possessions whatsoever to Cardinal Wolsey. Four years afterwards all these estates were forfeited to the king. In 1533 he granted to William Brereton all that precinct of the late Abbey of St. Thomas the Martyr of Liesnes, but he being executed in 1542 for engaging in the fatal transaction of Queen Catharine

Howard, the estates again reverted to the Crown. Henry next granted them to Sir Ralph Sadler. They subsequently passed to Sir John Leman, who sold them to Sir John Hippisley, in whose time some workmen digging by his order for stones in the place where the church of this abbey formerly stood, then overgrown with trees and bushes, found several stone coffins and a handsome funeral monument on which, says Hasted, was the full proportion of a man cut in free stone, his sword hanging at his side in a broad belt, upon which the *fleur de lis* or *luce* was engraved in many places, perhaps a device or rebus for the name of Lucy. This figure lay on a flat marble stone which served as a cover or lid to a hollowed tomb of white, smooth, hewn ashlar stone, in which, wrapped in a sheet of lead, lay the remains of an ashy dry body, whole and uninjured, having upon its head something like hair. There can be little doubt that the monument here spoken of by Hasted and quoted from Weever was that of Richard de Lucy, the founder of Lesness. This discovery occurred in 1630. Sir John Hippisley sold the estates to Sir Thomas Gainsford, of Crowhurst in Surrey, who in the reign of Charles I. sold them to Mr. Hows, of London, and he dying without issue, settled them by his last will for ever on the hospital of St. Bartholomew, Smithfield, London, in whose possession they now remain. Archdeacon Smith gives a quaint translation of Richard de Lucy's epitaph as follows:—

Richard de Lucy's light is snatched to shade,
To justice, peace and state his court was paid;
Christ with Thy saints and Thee, his rest he made,
July twice seventh on the world did shine:
The year eleven hundred seventy-nine.

An interesting account of Lesness Abbey, by Dr. Stukeley, was read before the Society of Antiquaries, April 12, 1753, and is published in the first volume of the "Archæologia," with an illustration of the north wall of the abbey church, which, though in ruins, was perfect enough at that time to indicate the architectural style. The lower windows were round-headed and the upper ones pointed, thus showing a transition from the Norman to a later style. The church was about 97 feet long and 40 feet wide, the tower abutting on the north side of the quadrangle at the junction of the nave and chancel, and so forming by its base a single transept. A doorway of the fifteenth century still exists, which seems to have become the principal entrance to the abbey. There are a number of pit dwellings in Abbey Wood, Crayford and Bexley. Lambard says, "There are to be seen as well in the open heath near Crayford, as also in the closed grounds about it, sundry artificial caves or holes in the earth, whereof some have 10, 15 or 20 fathoms in width at the mouth, and thence downward narrow, like to the tunnel of a chimney or passage of a well, but in the bottom are large and of great receipt, inasmuch as some of them have sundry rooms or partitions one within another, strongly vaulted and supported with pillars of chalk." Tacitus says, "They (the Saxons) are accustomed also to open caves underground, and in case of the approach of an enemy the open country is ravaged, but these hidden and excavated places are either unknown or escape from the very circumstance that they must be searched for." I have already described these caves in my former paper on "Charlton-on-Thames."

On Bexley Heath, near here, the London United District of the Ancient Order of Foresters have pitched their tent and built the first wing of an asylum from my plans. The arms of the family of Lucy, founders of Lesness Abbey, used to be in Bexley Church, as described by Mr. E. S. Johnson in the "Summer Excursions" of this Society, 1886. Archdeacon Smith mentions "a Scotch fir in Belvedere Park has reached the height of 70 feet, and is a conspicuous landmark far up and down the river."

I cannot conclude my notice of Erith without mentioning that it was inside the church the barons met in the reign of King John to discuss the provisions of Magna Charta before meeting the king at Runnymede. I have been very kindly furnished by our friend Mr. W. F. Harradence with the following notes on

Belvedere.

The word Belvedere, though used by the French to signify a terrace or turret, is really derived from the Italian, and signifies a beautiful sight. The mansion so named was built by Mr. Hayley, from whom it was purchased by Lord Baltimore, who died there on April 24, 1751. Mr. Gideon then purchased the property, and his son, Sir Sampson Gideon, who in 1790 was created Lord Eardley, rebuilt the greater part of the house, but the drawing-room of the earlier building still remains. In 1794, Maria Marow, the eldest daughter and co-heir of Sampson, Lord Eardley, was married to Gregory William, the eleventh Baron Saye and Sele. On the death of his father-in-law, the baron, complying with a proviso in the indenture of settlement, by royal license assumed the surname and arms of Eardley. In 1844 the baron died, and on the death of his son three years later, the property reverted to Sir

Culling Smith, who assumed the name of Eardley. Mr. Ruegg, writing about that time, told how lapwings, starlings, fieldfares, redwings, blackbirds, thrushes and larks made the district their home, and how even kites, kestrels and sparrow-hawks abounded. Lord Saye and Sele had contemplated introducing black grouse into the park, but his intentions were never carried out. A considerable portion of the estate had been sold by Sir Culling Eardley, and from his son the mansion and the remaining twenty-four acres were purchased in 1860 by Lieutenant Lean, R.N., for 12,148*l*. The very beautiful collection of paintings by Murillo, Teniers, Rubens, Hals, Matsys, Breughel and Van der Weyden was dispersed, and the mansion was converted into the Royal Alfred Institution for Aged Merchant Seamen, of which the Duke of Edinburgh was patron. John Harris conjectured that the bank or ridge commencing at the corner of Bostal Heath, and proceeding by the side of the present Woolwich Road through Abbey Wood and Belvedere Park to Friday Hill, was a Roman road, and that the old iron-smelting furnace near by was used by the Romans. From Belvedere House an extensive panoramic view is seen as of old; but the birds have flown, the trees have been felled, and the site of the beautiful park is crowded with tenements.

There is a very excellent view of Belvedere House in Hasted's "History of Kent." Gwilt, in his "Encyclopædia of Architecture," says:—"Belvedere House was designed by James Stuart, architect, who, in conjunction with Revett, about 1762 published the well-known work, 'Antiquities of Athens,' and thus acquired the sobriquet of 'Athenian Stuart.'" Not having visited this locality for many years, I was unaware till recently of the dispersion of its famous picture gallery, once the finest in Kent, and second only to that at Knole House. We may, however, console ourselves by the reflection that it would seem appropriate and in the fitness of things that Erith, this "Old Haven" and subsequent dockyard, almost the cradle of the English navy, should now find a home for our ancient mariners.

THE GEOLOGICAL SURVEY OF ENGLAND.

THE following record of geological work in England during the past year has been prepared by Sir A. Geikie, the director-general:—While mapping the drift and tracing the outcrop of the Rhaetic beds in the heart of England, Mr. Fox-Strangways has had occasion to revise the mapping of the area of Charnwood Forest. In that district a group of ancient rocks has been long known to exist, regarding the nature and age of which considerable difference of opinion has been expressed. In re-mapping the ground with the advantage of maps on the scale of 6 inches to a mile Mr. Fox-Strangways has ascertained that the overlap of the old rocks by the new red marl is much more extensive than had been supposed, and that in fact more than half of the area hitherto represented as occupied by the old rocks is really covered by the younger formations. The field-work over that interesting area has now been completed, and a large series of specimens collected from it has been placed in the hands of Mr. Watts for determination. Perhaps the most important new facts noticed in the course of the survey have been obtained at Baddon Wood and Garendon, where the contact of the eruptive rocks with the surrounding altered strata has been observed. The re-survey of the ground has likewise shown more clearly than was before known the abrupt topography of the land that sank beneath the waters in which Keuper marls were deposited. The old rocks hardly extend beyond where they are actually visible at the surface, and in many places where they descend steeply beneath the marls they must have risen as craggy or peaked islets out of the Triassic waters.

The so-called Skiddaw slates of the Isle of Man have occupied Mr. Lamplugh during most of the working season. He has found everywhere that they have been folded, faulted and sheared, these proofs of intense mechanical movement being more particularly visible along the coast-section. The complicated structure thus produced has been well brought out by the mapping of the quartzites, which occupy certain areas in the south of the island. The apparent great thickness and order of succession of the strata were found to be deceptive, the quartzites really forming comparatively thin sheets, but reduplicated by constant folding. In consequence of this complexity, no clear idea has yet been formed of the probable stratigraphical succession among the Skiddaw slates of this region, though certain broad zones of slate have been followed into the interior, while other flaggy beds have been traced northwards to Peel, until they are faulted against the Peel sandstone. An interesting feature among the Skiddaw slates of this island is the occurrence of certain coarse and fine breccias of slate fragments, which are considered by Mr. Lamplugh to be friction-breccias, produced by the breaking up of the slates under shearing-strain at the junction between harder and softer strata. He has found some obscure organisms in the slates, but nothing as yet of definite palæontological value. Much time has necessarily been taken up in mapping

the abundant dykes and veins of the Isle of Man to which reference was made in last year's report. It has long been known that these rocks belong to two distinct geological periods, viz. pre-carboniferous and post-carboniferous. The latter Mr. Lamplugh has found abundant on the west coast in the cliffs below Port Erin and Glen Meay. They occur also on the east coast as far northwards as the mapping has extended; but they are rarely exposed at the surface in the interior, although met with in mining. The earlier dykes, of pre-carboniferous age, occur almost everywhere in the Skiddaw slate area. They have generally undergone much shearing; and although they cross the contortions of the sedimentary rocks, they are occasionally themselves contorted. They present great diversity of lithological character. Certain petrographical types among them will not improbably be found to form definite zones. Thus an interesting set of quartz-keratophyre dykes (containing white mica) is found on the west coast between Fleshwick Bay and Lag-ry-Keeley, while between Glen Meay and Peel the dykes are of a totally distinct character (diabase?), and contain much dark mica. North of the Peel sandstone area still another type of dykes and intrusions is to be seen. Numerous specimens of these various rocks have been collected, and are now undergoing microscopical examination. On the west coast of the island, to the north of Peel, certain red sandstones occur, the exact geological age of which is still uncertain. Fossils have been known to occur in them, and Mr. Lamplugh has made an important collection of these organisms, which consist chiefly of rolled corals with some obscure gasteropods, brachiopods and polyzoa. The specimens obtained by him have been submitted to Messrs. Sharman & Newton, Palæontologists to the Survey, who find that though they are hardly specifically determinable, the corals seem to point to an Upper Silurian or Devonian origin.

In the progress of the survey of the Devonian rocks of South Devon the Plymouth area has been brought into connection with those of Newton Abbot and Torquay, and the same sub-divisions have been found to hold good in it as have been established further to the east. Thus the presence of Upper Devonian rocks has been proved by the discovery of the characteristic Entomides near Tor Point on the west or Cornish side of Plymouth Sound, in a series of slates which, developed on the north of the Plymouth Limestone, correspond in lithological character to the Entomis-slates of Torquay and Newton Abbot. The igneous rocks so abundant in the eastern part of the Devonian area have been traced westwards to Plymouth Sound. Those in the Upper Devonian series seem to be, as at Newton Abbot, for the most part intrusive. The Ashprington volcanic series has been traced continuously from the Totnes district, but in irregular and greatly diminished thickness.

The re-survey of the South Welsh coalfield on the maps of the 6-inch scale has made increased progress during the past year, as Mr. Strahan has been joined there by Mr. Gibson. Sheet 249, new series of the 1-inch map, has been completed, and sheets 232 and 263 have been begun. The area which has now been surveyed extends a little west of the Taff Valley, and includes the Caerphilly and Llancaiach basins, in both of which the Mynyddislwyn coal has been extensively worked. These basins are separated by an anticlinal ridge, which forms an important feature in the structure of the coalfield, from the fact that it brings the lower or steam-coals up to within workable distance from the surface. Special attention, therefore, has been paid to tracing out the exact position of the anticlinal and synclinal areas. In the ground outside the limits of the Mynyddislwyn vein (which was referred to last year as affording an excellent horizon) some impersistent coals of little commercial value have supplied the only indication of the structure of the ground. By tracing the crops of these seams Mr. Strahan has ascertained approximately what part of the Pennant Rock forms the surface of the ground over most of the area. The importance of the information thus obtained, and the desirability of tracing the faults that cross the anticline, will be readily understood from the fact that the principal collieries are now, or must in the future be, situated on the line of axis. Mr. Fox-Strangways has continued the survey of the Triassic area of Leicestershire. The chief results of his work have already been noted when referring to the area of Charnwood Forest.

In Staffordshire, Derbyshire and Cheshire, Mr. De Rance's drift survey has mostly lain over areas shown as Trias on the map of the solid geology, but largely covered by drift. Mr. De Rance has made a detailed examination of the sections that were exposed along the sides and in the bed of the Manchester Ship Canal, but which are now covered with water. The exposure of Triassic rocks there displayed seemed to prove that the upper mottled sandstones are much thicker in that district than was originally estimated.

Mr. De Rance makes a special report upon the results of borings which have been in progress for some years past in the Fleetwood and Presall district, and near the southern margin

of the Lancashire coalfield, and the northern margin of the Cheshire coalfield. The Fleetwood and Presall borings made to explore the salt deposits have shown that sandstone precisely similar to the Garstang sandstone underlies the Keuper marl of that area. The Garstang sandstones have hitherto been classed as Permian, but there can now be no doubt that they should be regarded as Triassic. This change brings the red rocks of Lancashire into harmony with those of Cumberland, where the St. Bee's sandstone, formerly classed with the Permian, is now regarded by the Survey as Trias.

The explorations along and beyond the southern border of the visible part of the Lancashire and Cheshire coalfields are significant in another direction. They appear to prove that in both counties the lower mottled sandstone, hitherto taken as the base of the Bunter, belongs to the Permian series, for above it, and below the Bunter pebble beds, lie marls with *schizodus*.

The only member of the staff engaged in mapping the jurassic system in England last year was Mr. Cameron. While carrying on the Drift Survey in Huntingdonshire and the adjacent counties he has revised the lines of the jurassic formations shown on the published map. In so doing, he has found corallian fossils in some new localities in the great clay series of Huntingdonshire and Bedfordshire, but the sections where the organisms occur are so few that it has been found impossible to map the corallian strata separately, and they have accordingly been left coloured as Oxford clay.

Messrs. H. B. Woodward and A. Strahan made an examination and measurement of the jurassic formations in the Dorsetshire cliffs, from near Swanage to near Weymouth, for the purpose of obtaining material for a detailed section. At the same time Mr. Strahan took upwards of seventy photographs of features of geological interest on that coast line, many of which are being prepared for exhibition in the museum, each accompanied by an explanatory sketch. Others were taken with a view of being reproduced in a forthcoming memoir. The most important contribution made by the Survey during the year to jurassic geology is the volume of the "Jurassic Memoir," by Mr. Woodward.

In confirmation of what was said in the last report regarding the advantage of tracing the sub-divisions of the chalk, Mr. Hawkins reports that the middle and lower chalk can be shown to occur in the valley of the Meon in Hampshire nearly as far south as Meon Stoke and Droxford, where they were not previously supposed to be visible. Similar evidence of the value of tracing these sub-divisions has been obtained in Dorsetshire by Mr. Jukes-Browne in ascertaining the continuance of the Melbourne rock and chalk rock through the county. The lower and middle chalk are found to diminish in thickness towards the west; the former also thinning southwards down to 50 feet or less. A bed of smooth chalk appears between the Belemnite marl and the Melbourne rock, and thickens in the same direction in which the lower chalk thins. The chalk rock of Dorset varies much lithologically. In one place (Winterbourne Abbas) two beds of hard brecciated rock were found to be separated by 5 or 6 feet of softer glauconitic chalk containing large grains of quartz. The brecciated material contains small fragments of fine-grained greensand, which, as Dr. Barrois has noted, correspond with varieties of upper greensand, indicating possibly that the upper greensand was undergoing erosion not far from this place during the formation of the chalk rock.

Along the southern strip of Sussex extending from Eastbourne westwards into Hampshire, the sub-divisions of the chalk, which were traced during the Drift Survey of that district, are now shown both on the old and new series of maps. A boring east of the Lincolnshire chalk area near Willoughby proved that the Tealby series there underlies the glacial drift. It seems probable that a long tongue of lower cretaceous rocks runs north-west past Alford to South Thoresby, where these beds are exposed at the surface. This alteration with other minor corrections were made by Messrs. Jukes-Browne and Strahan, and have now been engraved on the map (sheet 84). An account of this boring at Willoughby, with its bearing on the general structure of the district, has been published by Mr. Jukes-Browne. (Quart. Journ. Geol. Soc., vol. 49, p. 467.)

The progress of the mapping of the Eocene deposits in the western part of the London Basin has, during the past year, cleared up the true position of the Ramsdell clay. It appears from Mr. Blake's field work that two distinct beds of clay have been classed together, though one of these really belongs to the London clay, while the other forms part of the Bagshot series. This observation is of some local importance, inasmuch as it removes the trace of what appeared to be an overlap or unconformability between Bagshot sand and the London clay, the outcrop of the latter having been made too narrow at one place on the published map.

The mapping of the Eocene deposits of Hampshire has been carried on by Mr. Clement Reid westwards into Dorset. Several unexpected features have arisen in the course of the work, regarding which it is hoped that some definite information may be given in my next report.

The survey of the superficial deposits has made steady progress during the year, 2,711 miles of boundary lines having been traced. Few observations, however, have been made which seem to call for special mention in this report. Mr. De Rance has noted the character and position of nearly five hundred boulders from 2 to 12 feet in length in East Cheshire, and has supplied information concerning them to the British Association committee on erratic blocks.

In the prosecution of the re-survey of the South Wales coalfield the superficial deposits are mapped simultaneously with the solid geology, and during the past year Mr. Strahan has found that the drift increases in importance towards the west. In the form of mounds of gravel and gravelly clay, it overspreads much of the low ground and runs up all the main valleys. Many additional instances of glaciated rock-surfaces have been observed, showing a southward movement of the ice.

In the course of the survey of the Isle of Man, some interesting information regarding the glacial deposits has been collected by Mr. Lamplugh. He has observed and recorded glacial striæ in some sixty localities, indicating a general movement of the ice along the main axis of the island, although on the lower ground towards the south-west the movement appears to have been nearly in a north and south direction. The drift deposits of the western side of the island south of Kirk Michael are separable into two groups, one of which clings to the high land and consists entirely of local detritus, while the other covers lower ground, is largely made up of material foreign to the island, and generally contains shell-fragments. These two groups seem to dovetail into each other. The drifts in the lower grounds, containing far-derived materials, are generally stratified, sometimes arranged in kame-like mounds and sometimes forming definite platforms. On the foreshore at Kirk Michael some fossiliferous sands lie near the base of the drifts. Striking examples of steam-erosion, hardly explicable under existing topographical conditions, have been observed by Mr. Lamplugh. These and the higher platform gravels of the central valley of the island probably date from the close of the glacial period.

In addition to the ordinary petrographical work, the petrographers occasionally encounter problems which require for their solution a knowledge of the chemical composition of certain rocks. Mr. Teall during the past year has made four analyses of this nature in the laboratory of this institution, and two others have been made for us in the metallurgical laboratory of the Royal School of Mines, for which we are indebted to the courtesy of Professor Roberts-Austen.

The mineral riebeckite is at present known to occur at so few localities that its recognition as a normal constituent of the granophyre of Meall Dearg, near the head of Glen Sligachan, in Skye, seems to be of sufficient importance to deserve mention here, especially as fragments of riebeckite-bearing rocks occur not infrequently in the glacial deposits of our west coasts. The discovery of this mineral in the Skye locality was made by Mr. Teall in the course of his examination of a series of slides made from specimens collected there last year.

The members of the Geological Survey, besides the researches which they may be able to carry on in their own time apart from their official duties, are led in the prosecution of these official duties to make many original observations which, though often of considerable scientific interest and importance, can sometimes hardly be appropriately made known in the publications of the Survey, or must wait for some time until a convenient place can be found for their announcement in any official form. It is not desirable, either in the interests of science or of the able investigators themselves, that these observations should remain indefinitely unpublished. Hence it has been customary to allow the results of research by members of the Survey, after having been submitted to the Director-General, to be made known to the world in anticipation of any subsequent publication of them in an official form. In this manner much good work has been brought without delay before the general body of geologists, and the scientific reputation of the staff of the Geological Survey has been well sustained thereby.

YORKSHIRE ARCHÆOLOGICAL SOCIETY.

THE members of this Society have just paid a visit to Middleham. More than fifty members assembled, and among them was Canon Greenwell, of Durham. Mr. Brown, secretary of the Society, acted as cicerone. The party proceeded in waggons to the ruins of Middleham. This was built probably about the twelfth century, and became the chief residence of the King-maker, Earl of Warwick. From thence he went forth to defeat the Lancastrians at Blore Heath, and here Edward IV. was kept a prisoner, and a very easy sort of imprisonment it was, for he was allowed the privilege of hunting, and one day his horse carried him so far that he never came back again. All this and much more, the *Leeds Mercury* says,

anyone may read for themselves in Bulwer's "Last of the Barons." Simple people go to Middleham Castle with the belief that Richard III. was a very unsavoury character, anything but to be desired. They come away finding him a most popular person, beloved of all his tenants; his badge (the boar) being still the most conspicuous in the town, whereas elsewhere it was defaced and pulled down, the murder of the Earl of Northumberland by Yorkshiremen being inspired by their love for the hump-backed Luke. The architecture of Middleham was explained, and one felt that if Duke Richard daily filled the great dining-room with his neighbours, and used the buttery hatch to distribute the broken victuals to the poor, there would be little to wonder at in his popularity if he had been the hangman himself. From the castle a move was made to the church, once held by a body consisting of a Dean and six Canons, founded by the piety of the aforesaid Richard III. There was little in the church calling for remark beyond two small openings at the east end, which certain benighted people thought were leper windows. "Not at all," says the antiquary, never so delighted as when overthrowing a popular myth; "lepers were kept in the hospital, of which there was one at Middleham, and never came to church at all. The openings were for the ringing of the Sanctus bell, to let people know when the Host was elevated." If there was nothing interesting in the church there was in the statutes of the Canons prescribing their eating and drinking, for it would seem they were allowed to get two butts of wine annually from Duke Richard's bounty. Now, as there were only seven of them to enjoy it, one may see what a liberal allowance this was. Mr. Andrew Lang has been saying lately that if he had to choose when he would like to have lived, he should have chosen the Middle Ages as to time and a monastery as to place. The Canons at Middleham at least seem to have had a good time of it. Leaving Middleham the party drove off to Coverham, where the very name of the abbey shows the wisdom of Mr. Lang's choice. It was a "Premonstratensian," so called because the Virgin herself appeared to the founder, and showed (premonstravit) not only where she would have it built, but also the shape of it, and even what its inmates were to wear. We toil and trouble over plans and sit on committees, and probably fail after all; Saint Noribert simply went to sleep and everything was done. At the dissolution certain charges were made against the Prior, but he cleared himself so successfully that the king granted him a handsome pension. After Coverham the route lay through the racing stables for which the neighbourhood is now famous and which were much too modern for archaeologists to take any interest in, and so no stop was made until the unrestored church of Wensley was reached. Here is a very fine brass of a former vicar, perhaps the best in existence, and the family pew of the Lords of Bolton, which reminds one that if there are no distinctions in the church above, there certainly are in the church below. Here the party listened to a charming address on "Memorial Crosses," by Canon Greenwell, who begged all lovers of what was ancient to preserve them from fracture or desecration, and even going so far as to say that if those who had the care of them would not do so, even when their duty was pointed out to them, then they should be taken and placed where they would be cared for; a sentiment the antiquaries quite agreed with. A short drive back to Leyburn brought an enjoyable excursion to a close.

GLASGOW ARCHÆOLOGICAL SOCIETY.

TO the many pleasant excursions made by this Society to places of archaeological interest in Scotland falls now to be added that to the island of Inchcolm, in the Firth of Forth. There were few of the party, however, who did not, the *Glasgow Herald* remarks, recall the fact that it is only two years ago since Professor Veitch, one of the Society's ex-presidents, had been the Society's valued guide on such another excursion to the archaeological relics of his own Tweedside. Inchcolm Island occupies a position of great beauty, with, as one looks to the sea, Aberdour across the waves to the left, and nearer at hand lie the beautiful woods and grounds of Donibristle; on the right hand, but as it were behind us, are Dalmeny and Barnbogle Castle, and in the distance the grey smoke of Edinburgh, with Arthur's Seat towering aloft. A paper was read by Mr. J. Dalrymple Duncan, F.S.A., one of the hon. secretaries. The island was traditionally a residence of St. Columba while conducting his missionary enterprise in the surrounding district, and at all events was early looked upon as a place of peculiar sanctity. According to Hector Boece, the Danes, after their defeat at Kinghorn, besought of the victors the privilege of burying their dead in the island. In "Macbeth" Shakespeare duly makes Rosse, after he has reported the successful issue of the contest, state that:—

Sveno, the Norways king, craves composition;
Nor would we deign him burial of his men
Till he disbursed, at St. Colme's Inch,
Ten thousand dollars to our general use.

A sculptured hog-back stone still on the island is supposed to

be a Danish monument. The humble cell of a Culdee hermit who succoured King Alexander I. when wrecked there, has now been restored in a simple and satisfactory manner. It is of unique archaeological interest. Although Alexander vowed to erect a monastery on Inchcolm, it owes most to his successor David, the "Sore Sanct." The order established was that of Canons Regular of St. Augustine, who were not absolute recluses, but were allowed to perform the duties of parochial clergy. In 1543 the last abbot surrendered his office and the island ultimately passed to the Earls of Moray. From Inchcolm the Archæological Society proceeded to Aberdour, and after luncheon visited the remains of Aberdour Castle, the keep of which is believed to have been erected about the beginning of the fifteenth century. The double terrace in front of the castle commands a lovely view of the Forth. From Aberdour the party drove to Dalgety Old Church, where the Rev. Mr. Craig, the parish minister, gave an interesting account of this pre-Reformation building and its curious monuments and inscriptions. A short but beautiful drive brought the party to Donibristle, one of the seats of the Earl of Moray. Here Mr. Normand, the Earl's commissioner, and the Rev. Mr. Craig acted as courteous and efficient guides. The central portion of the house was destroyed by fire about forty years ago and has never been rebuilt. The older subterranean passages where the Bonny Earl of Moray was murdered in 1592 are, however, still intact, and were visited with much interest. The situation of Donibristle is one of exceptional beauty, and the grounds are maintained in excellent order, although the noble owner has not for many years been within their gates. On returning to Aberdour the Society dined in the Aberdour Hotel, with Mr. Dalrymple Duncan as chairman and Mr. W. G. Black as croupier, and thereafter returned to Glasgow.

Decoration of Glasgow Municipal Buildings.

SIR,—I suppose there was no painter who read your account of the proposals for the decoration of the Glasgow Town Hall and did not rejoice at the chances which await Glasgow artists, for I hope the commissions will be given to local artists alone. The city is nurturing a school of art that has gained both admiration and patronage abroad. For the school in the present state there could hardly be a more advantageous influence than would be offered by a competition for the adornment of a large public building. At the same time, it will be risky if the Corporation and citizens insist on the completion of the work at once. Let them consider how long the Panthéon in Paris has taken. The spandrel figures by Baron Gros were executed in the early part of the century, and they have had their use, because they made it apparent that a very different style was needed. What it was can hardly be said to be yet settled. When the commissions for the decorations of the lower part of the building were assigned, it was understood that every artist was to follow the style he preferred, or which could be considered most characteristic of his ability. As everybody knows, Meissonier could not make up his mind about the treatment. He made a design, but the colour obstacle daunted him. Yet he was not worried, although all amateurs were more curious about his experiment than any of the others. In the Panthéon M. Puvis de Chavannes demonstrated that decorative work differed from easel work, and although the other painters, including Meissonier, held some notion of the same kind, with all their experience they could not realise what it meant until they saw the panels representing the childhood of St. Geneviève. One of the competitors who was opposed to the style of M. Puvis told me he was greatly grieved because his own work had not been completed before that master's. The treatment which made the panels less obtrusive than the masonry could not well be imitated by other painters in the same buildings. Despairing of an attempt of the kind, several of the painters, as if to show their independence, emphasised their own peculiarities. M. Laurens is more sombre in the Panthéon than is common with him, and he is generally in a tragic mood. M. Cabanel goes beyond his average prettiness, and so of others. But on that account the secularised church gains more interest than if the treatment were uniform. If one man is able to take up the decoration of a building, it may be a question whether it is preferable to compel him to adhere to uniformity, or to allow him to express the growth of his powers. I cannot believe that M. Olivier Merson, if requested to add others to the "two beautiful frescoes, or rather wall-paintings" admired by the Glasgow councillors in the Palais de Justice, would adopt the archaic treatment seen in them, and which he

relished in his youthful days. He has attained an amplitude of style which I fancy he would not, perhaps could not, neglect for the sake of insuring uniformity. In Glasgow it will be wise to allow as many competent artists to co-operate as can be found in the city, but at the same time every allowance should be made for them if they show timidity before grappling with their subjects. An ordinary easel picture we know can be relegated to a cellar or an attic if the possessor has attained a connoisseurship which makes him undervalue it. For a wall-painting there is no escape. It is fixed to one position, and must continue to submit to the criticisms of generations. A painter who remembers the fate of his work should be excused if his fastidiousness occasionally gets the better of him.

For these reasons I hope the Corporation will not adopt the course that is advantageous with constructive works above or below the streets. It is well to assume that works of that kind can be accomplished with as much regularity as if they were the product of machines. But a novel kind of painting that is expected to represent the utmost competence of the great city of the North should be considered in another light, and no estimates made of the quantity that can be produced per month or per year. If the Corporation will take the trouble to consult with painters who propose to attempt the work, trouble will be spared hereafter.—Yours truly,

R. I.

Old St. Paul's.

SIR,—In your issue of the 7th inst. you say, "The geography of the British Isles could not then be taught in schools, because the author has to inform his readers that Portland is in Dorset." Might I add that this information is necessary in many cases nowadays, in spite of all the education of Board and other schools, for hardly a week passes without letters being addressed to me at "Portland, Isle of Wight," "Portland, Devonshire," &c., instead of "Portland, Dorset." A wrong idea concerning the place seems also very prevalent, many people that I have met being under the impression that Portland is a rock, solely inhabited by the convicts and those who have to do with them, and that they quarry the stone, which gets from their hands by some means or the other into the market. Only so recently as September 7 I happened to be returning from town with a lady who had travelled down from the North of England to meet her husband, a captain of a steamer which was calling at the island for coals, and as she had missed one train and there were two hours to wait for the next before she could get to Portland, I suggested she should drive there by cab, and to my astonishment found she was afraid to venture by herself and child in a cab, and upon my inquiring why, she said she was under the impression that the island was solely inhabited by convicts, and she was afraid of molestation. When I assured her she might with perfect complacency drive in, and trust herself to the tender mercies of the driver, whose only object would be to reach the destination as soon as possible and return home with his money and go to bed, she seemed much obliged.—Yours obediently,

Portland, Sept. 8.

F. J. BARNES.

Ventilation and Flushing of Sewers.

SIR,—I have read with much interest "Engineer's" letter on this subject in your last issue, and having been engaged exclusively for the last nine months in studying and experimenting upon the ventilation of sewers, in conjunction with Mr. Caink, Assoc. M.Inst.C.E., our city engineer, I should like, with your permission, to give the results of our work.

Mr. Caink long ago came to the conclusions which Dr. Clark has recently expressed, and which "Engineer" and other authorities now endorse, namely, that the so-called "free ventilation" of sewers is a wholly unnecessary evil; that to encourage or allow air to rush through them is simply to brush the foulness off their walls into the streets, and that ample relief of pressure is all that is needed.

Dr. Clark proposes to relieve by occasional high shafts. "Engineer," rightly objecting to these as only raising the danger from street to bedroom-window level, advocates the use of furnaces to purify the necessarily outgoing sewer air by heat.

Mr. Caink, troubled like most municipal engineers by complaints of smells, has tried in practice both the remedies suggested above. He found it difficult to obtain permission to put up high shafts, costly to erect and maintain them, impossible to render them anything but unsightly, and finally, more dangerous to discharge poisonous gases near bedrooms than at ground-level. Complaints in some cases did cease, but sleepers rarely complain.

The constant expense of gas furnaces is against them; they act only for a limited distance, and if they are called upon to act as inlets (and it must be remembered that about as much air must enter a sewer as leaves it) they are very liable to blow out.

These experiences led Mr. Caink to adopt a system of filtration by cotton wool placed in the existing manhole and lamphole shafts, and kept dry and pervious by a heat-equalising arrangement which prevents that condensation so fatal to previously designed filters. The system, while checking the irresponsible and erratic action of the wind, allows ample ingress and egress for air—"breathing," in fact—and all expirations are rendered harmless by the germ filter.

The manholes on a troublesome and noisome length of sewer here were fitted a year ago with these filters. Fear was at once expressed that we were only "bottling up the stench," which would come out somewhere else instead. To test the truth of this supposition I have taken anemometer readings at the holes (five in number) at various times on upwards of sixty days since the beginning of this year, with the result that I never found all, and scarcely ever even a majority, of the shafts acting as outlets. Manifestly, had there been an accumulation or "bottling up" of pressure, each shaft (the filter therein being temporarily removed to admit the anemometer) would have shown an out-current.

In addition to proving absence of pressure, these long-continued observations have shown—what Mr. Mansergh found in more extensive trials at Beckenham—that the direction of flow of air, to and from sewers is extremely erratic and not to be foretold. Lower the anemometer into a shaft, and it will, perhaps, show a strong in-current. In a few minutes, or seconds even, it will reverse, and a stench of a most unpleasant nature will issue. Then the vanes may remain motionless, then turn one way, then the other—all of which clearly shows that not more ventilation but less is required—less disturbance, less idle rushing through the ever foul tube of air-currents induced by the wind, and more gentle and equable relief.

I enclose chart of observations for your inspection. Each of the 400 odd squares represents the net result—total in and out-current—during a fifteen minutes' reading. Fully a half of them, you will see, show some in and some out-current. Unfortunately it is impossible on so small a scale to record the frequency of the alterations of direction or number of "respirations" in each quarter of an hour.

Since the "Cainks" have been in there has been no nuisance on this length, and we are now fitting other troublesome places with the filter, which is also being tried in other towns. It seems to me exactly to meet "Engineer's" suggestion of allowing for "constantly circulating a smaller quantity of air through the sewers by means of ventilators which, by heat or some other means, render the gases passing out quite innocuous so far as their power to produce disease is concerned."—Yours truly,

W. E. BUCK.

Worcester: September 10, 1894.

GENERAL.

The Marquess of Lansdowne and Sir Charles Tennant have been appointed to succeed Sir A. H. Layard and Viscount Hardinge as trustees of the National Gallery.

The Dean of Lichfield, in speaking about the restoration of the cathedral on Saturday, mentioned that 90 years ago some of the finest stained-glass in the world had been discovered in a barn in Belgium, which had been employed to fill seven of the windows in the lady chapel. Similar glass, about 350 years old, was lately discovered in a cellar in London, and was secured for the cathedral.

The Annual Exhibition of Art which was opened in Berlin last May has been a financial failure, and the committee will have to meet a deficit.

The Abbé Sobaux has had plans prepared for a new church at Montmartre, the walls of which will be constructed of iron and cement. A site has been secured in the Place des Abbesses. If funds admit, mural painting and stained-glass will be largely employed.

The Scheme proposed by Mr. James F. Reade, A.M.I.C.E., London, for the supply of water to Kilkenny has been accepted by the Corporation of that city. Fourteen schemes were submitted, but the names of the other competitors have not been published as the terms of the competition were strictly secret. The estimated cost is 21,500*l*.

The Expenditure on the church at Montmartre, Paris, has reached the sum of 26,960,000 francs. The subscriptions during July amounted to 96,597 francs, making the total receipts 27,594,713 francs.

The Lord Mayor of Manchester on Wednesday distributed the prizes to the successful students of the Manchester Art School.

A new pleasure pier and pavilion is to be constructed at the west end of Morecambe, the plans for which are being prepared.

The Architect.

THE WEEK.

THE eighteenth course of lectures and demonstrations for sanitary officers which will soon commence at the Sanitary Institute will be of a very scientific character, and as the lectures are to be given in the evening they are worth the attention of students of architecture. There will be two lectures on Elementary Physics by Mr. JOHN CASTELL-EVANS, F.I.C. A Practical Demonstration of Examples of Building Construction under the By-laws and Offensive Trades, &c., at Mitcham, conducted by Dr. L. W. DARRA MAIR. Two lectures on Elementary Chemistry by Dr. S. RIDEAL, Public Analyst. One on Elementary Bacteriology by Dr. R. T. HEWLETT. Sir DOUGLAS GALTON will lecture on Ventilation, Warming and Lighting. Mr. H. LAW, C.E., will explain the Principles of Calculating Areas, Cubic Space, &c.; Interpretation of Plans and Sections to Scale. Among the lectures will be Water Supply, Drinking Water, Pollution of Water, by Mr. J. WALLACE PEGGS, C.E.; Sanitary Building Construction by Mr. KEITH D. YOUNG; Sanitary Appliances, by Prof. W. H. CORFIELD; Details of Plumbers' Work, by Mr. J. WRIGHT CLARKE; House Drainage, by Mr. W. C. TYNDALE, C.E.; Sewerage and Sewage Disposal, by Prof. HENRY ROBINSON, C.E.; Scavenging, Disposal of House Refuse, by Mr. CHARLES MASON, C.E.; Sanitary Law, English, Scotch and Irish, General Enactments Public Health Act, 1875, Model By-laws, &c., by Prof. A. WYNTER BLYTH; Sanitary Laws and Regulations Governing the Metropolis, by Dr. LOUIS PARKES. There will be several inspections of sanitary and other works.

In the quarterly number of the "Illustrated Archaeologist," which Mr. J. ROMILLY ALLEN edits with much judgment, there is a suggestive article by Mr. G. F. HILL on "Roman Copies and Greek Originals." It refers to the importance which has been of late given to Greco-Roman statues as if they were faithful copies of Greek works. Mr. HILL considers that they should not be accepted unreservedly, and he bases his argument on what is known about coins. There are undoubted originals of some Greek coins, although they are not as abundant as is imagined, and there are copies which are often taken for originals. The majority of visitors to museums would confound the two varieties, especially as there was no means in old days of exact reproduction by electric agency. It is only necessary to examine them in detail to perceive the difference, which can also be made manifest from photographic plates. Mr. HILL sums up by saying, "Greek art advanced by distinct stages; and it is quite possible to extract from Roman copies, considered intelligently in relation to such originals as we have, much information as to the treatment of hair, drapery, attitude, proportion, &c. by different schools, and even by the same artist at different stages of his development. But these things are nothing more than the externals; they can never give us a real knowledge of what Greek art was. For this we must seek the originals. We are richer in these than we were in the days of WINCKELMANN, and there is no excuse for neglecting them. In these days of popular lecturing the average person only sees what is thrown on the screen, and for nine archæological flirts who carry away a pleasant impression of the Roman copy perhaps one student remembers that it is nothing more than a suggestion of something much finer and more beautiful."

It is sometimes said that modern museums and picture galleries are only to be upheld by the outlay of large sums of money. The Irish National Gallery suggests how much can still be accomplished with moderate sums. Many a private collector might take the purchases of that institution as a guide. Under the late Sir HENRY DOYLE the gallery was created without causing any grumbling among taxpayers, and Mr. WALTER ARMSTRONG is conducting it with an equal respect for economy. Last year he had at his disposal no more than about 1,000/. Yet he was able

to secure the following examples:—Landscape (near Salisbury?), by JOHN CONSTABLE; Landscape in Wales, by J. D. HARDING; Irish Landscape, by BARTHOLOMEW COLLES WATKINS; Classic Landscape (water colour), by F. O. FINCH; Interior of a Flemish Mansion, by NICOLAS GISELAER; Farm House Interior, by D. TENIERS; Landscape with Cattle, by W. ROMEIJN; Martyrdom of a Saint, school of GAUDENZIO FERRARI; Still Life, by PIETER CLAESZ; Portrait of an Italian Gentleman, by ANDREA SOLARIO; Portrait of a Gentleman, Dutch school; Portrait of a Lady, by JERVAS; Head of a Man (pencil drawing), by ANTONIO MOR; Study of a Child (chalk), by FRANÇOIS BOUCHER. A series of lithographs after the cartoons of "H. B." (JOHN DOYLE), and a miniature Portrait of Richard Lalor Shiel, by J. HAVERTY, were also obtained for the National Portrait and Historical collection. The following donations were received during the year:—A Portrait of Lady Claud Hamilton, by JAMES SWINTON, was presented by the Hon. Mrs. SWINTON, the widow of the painter; a Portrait of Sir John Stevenson, Mus. Doc., was presented by the Marquess of HEADFORT for the Portrait Gallery; the Robing of Esther, by WILLEM DE POORTER, was presented by the Director; an Interior of a Guard Room, by PIETER POTTER, was presented by Mr. R. H. MILLNER. At the last meeting of the governors and guardians attention was again drawn to the urgent necessity for an extension of the gallery buildings, and when pictures are obtained so cheaply that is not surprising.

THE congress of the Sanitary Institute will commence on Monday next in Liverpool. The section of engineering and architecture has for president Mr. G. F. DEACON, C.E. The vice-presidents are Mr. CHARLES H. BELOE, Sir DOUGLAS GALTON, Mr. HENRY HARTLEY, Professor HELE-SHAW, Sir ROBERT RAWLINSON; and the hon. secretaries, Major LAMOROCK FLOWER, Mr. EDMUND KIRBY, Mr. W. HOWARD-SMITH and Mr. COARD S. PAIN.

It is well known that EUGENE DELACROIX was a great admirer of English art in various forms. The extracts from his journal which appear in the new number of the *Revue des Deux Mondes*—a periodical to which the great painter was a contributor—reveal that up to 1855 his opinions concerning English painting remained unchanged. "Among the English," he says, "there is a real finesse which dominates even the imitative efforts found here and there, as in our unhappy school. Finesse among us is the greatest rarity. Everything appears to have been done with coarse tools, and, what is worse, by obtuse and vulgar minds. Take away MEISSONIER, DECAMPS, one or two others more, and a few pictures of the youthful INGRES, and all is commonplace, dull, without intention, without warmth. This so-called land of drawing offers really no trace of it, not even in its most pretentious pictures. In the smallest English design well-nigh every object is treated with the interest it demands; landscape, maritime views, costumes, scenes of war, everything is charming, rightly touched, and above all drawn. What good faith amidst the pretended imitation of the old pictures! Compare, for example, *The Order of Release*, of HUNT or of MILLAIS—I know not which—with the work of our Primitives or Byzantines, those men of one idea who, with their eyes fixed on the images of another time, take nothing but the stiffness, without adding the qualities that belong to it. This mob of unhappy mediocrities is enormous. There is not a trait of truth in their work, of the truth that comes from the soul, not a single thing like this infant that slumbers (in *The Order of Release*) in its mother's arms, and whose little silken tresses, whose sleep so full of truth, and whose features, with all else, down to the very red of the limbs and the feet, are quite remarkable in observation, but above all in sentiment." DELACROIX was bilious and was not perhaps able to do justice to men like INGRES or the FLANDRINS, who were the pupils of INGRES. He lost no opportunity to strike a blow against the dominant schools. But he recognised in the English an effort which, if it differed from his own, was, like it, an assertion of liberty against academicism.

BETTERMENT.

THE select committee of the House of Lords on "Town Improvements (Betterment)" came to the conclusion that "The principle of betterment, in other words, the principle that persons whose property has clearly been increased in market value by an improvement effected by local authorities should specially contribute to the cost of the improvement, is not in itself unjust, and such persons can equitably be required to do so. But the effect of a public work in raising the value of neighbouring lands is shown by experience to be uncertain. Whether, in any particular case, it is possible for a valuer to pronounce that such an effect has been produced by the completion of any public work, is a point upon which the evidence of eminent valuers differs greatly."

In these words, and in the latter part of them especially, we have as fair a statement of the pros and cons of betterment as could be given by any body of men of business in the kingdom. People who have faith in change as a remedial agent commonly suppose that it is only necessary to undertake what is called an improvement, and that profits, more or less immense, are sure to follow immediately. It is not sufficiently understood that the making of new streets and the erection of houses in them are speculations, and as such are as liable to bring painful disappointments as any transaction on the Stock Exchange or the racecourse. Social and political reformers cannot believe in that sort of result, for they are generally gifted with an extraordinary amount of faith in the operations of their own schemes. Like the Cardinal in the play, they do not much believe in contingencies, and least of all in those which entail failure. But a valuer of property, like the commander of a ship, is bound to conclude that favouring gales are not always blowing. When, therefore, we find the Lords' committee declaring that "the effect of a public work in raising the value of neighbouring lands is shown by experience to be uncertain," it is evident that the testimony of gentlemen of experience and ability like Mr. EDWARD TEWSON, Mr. ROBERT VIGERS, Mr. WESTACOTT, and Mr. F. W. HUNT of London, Mr. BRIDGFORD and Mr. SINGTON of Manchester, prevailed over their lordships.

The evidence given by those gentlemen corresponds with the convictions of the majority of architects and surveyors who are no longer in the sanguine period of immaturity. The success of a street or of a building, where there is no compulsion such as necessity sometimes imposes, depends on what is the most uncertain of all things, viz. the whims of the public. One case which exemplifies the difficulty of judging of the future of new property in a remarkable way is unhappily familiar to every reader of a newspaper, that is, the notorious "New Arcade" in Tipperary. It was constructed at a time of extraordinary excitement, when the whole inhabitants of the town had resolved to withhold their custom from every dealer who occupied shops on the property of an excellent landlord, but who was destined for a victim. The shopkeepers, therefore, were compelled in order to gratify their customers to emigrate to the new arcade. The relations between the purchasers and vendors continued unchanged, for there was a mutual agreement in the exodus. It was reasonable to conclude that the speculation must be financially prosperous. Shrewd English visitors adopted that view, for every influence which prevails in trade was exercised in its favour. Moreover, anyone who was even lukewarm in supporting the arcade incurred risks which in Ireland can become fatal. Yet, in spite of the exceptional advantages possessed by the tenants, the shops turned out to be failures that might be called ludicrous if they did not bring misery to a crowd of dupes. The projectors have been afraid to approach the place, and have left the tenants in the lurch. The Tipperary arcade is an object lesson not only for those who may contemplate injury to their neighbours, but for all who believe they have only to set out a course, and that fortune must follow it. One party of politicians have employed the history as a warning to people who belong to a rival party, but it is no less striking if we consider it as an example of the hazards which await attempts to make trade deviate from established ways. It may be said that the Irish are spasmodic and impracticable. But how are we to explain the failures in

England, which are as real, although they have not been brought continually before the eyes of the world? The Columbia Market in Bethnal Green has had as little success as the strategic arcade. The benevolent lady who raised it has, out of pity for costermongers and their poor patrons, offered the stalls for a mere nominal rent, or all but gratuitously, yet the people preferred to endure the inclemency of the winter in the neighbouring streets rather than be sheltered in the costliest building of its kind in England. Wholesale dealers appeared to be no less afraid of Gothic architecture. Nobody could have foreseen such a result. As long as it exists experts must, however, be cautious in believing that success will attend all improvements. The property market is subjected to so many accidental causes, and is therefore so variable, that Mr. VIGERS was justified when he said to the committee, "I defy any man to say whether any house in London ten years hence is going to fetch the same rent, or more or less rent." London is not unique in this respect. The larger provincial towns are also affected in a manner that seems to be capricious, and in foreign capitals, where there is less liberty, similar mutations are not unknown.

In sharing uncertainty, property corresponds with many other things. Excellent books appear to be created for the benefit of the dealers in waste paper, and who can say what prices the costliest pictures will fetch ten years hence?

Some of our unprofessional readers may say that we have exaggerated the precariousness of the circumstances which surround property in towns. Let us take a few tests, and first some relating to property in new thoroughfares. Mr. VIGERS in relating his own experience was able to go back to the history of New Oxford Street. In the course of his evidence before the committee he said:

The traffic originally, in my younger days, used to go through Broad Street, Bloomsbury, and St. Giles, and it was a very difficult way to get the large traffic through. It was thought that a street joining Holborn and Oxford Street so short a distance apart would be a very valuable street. It is only within very recent years that the property has been at all a success. The effect was to simply destroy the property in Broad Street. When the houses (in New Oxford Street) were built they were occupied for short times. People went bankrupt in the street. They did not get proper interest on their outlay for their buildings, and it was a great failure.

The evidence given by Mr. EDWARD TEWSON (of the firm of DEBENHAM & TEWSON) was no less emphatic about the failure of that early improvement and of some others. He said:—

I have had large experience with reference to the creation of new streets in the City of London, and I know that no man could tell this year or next year what the probabilities of that new street will be. It is impossible to tell. We all of us know that London is very peculiar in that respect. It takes a very long time to accustom the inhabitants of London to go into new streets. Take for instance the Thames Embankment. I remember very well for many years having to come constantly to these houses and the Courts of Justice, and on the Thames Embankment one could frequently come from Blackfriars Bridge to Westminster without meeting a dozen carriages. It takes years to accustom the public of London to any particular street. I can give your lordships a good many illustrations with regard to the effect of that. First of all, Mr. Vigers spoke about New Oxford Street. I thoroughly agree with all that he said about that. When that was formed it was considered it would be equal, at all events, to the streets from which it formed a link; that is to say, Holborn at the east end and Oxford Street at the other. That has never yet been the case. The buildings in New Oxford Street have never yet realised the rents even now (and it is fifty or sixty years since it was formed) which were realised and are realised by the premises in Oxford Street and in Holborn. Then Victoria Street, Westminster, that also remains to this day unfinished. I have offered myself, only a few months ago, one of the largest sites in Victoria Street for sale, and failed to find a buyer. It has been empty ever since the street was formed and remains empty to this day. I know of my own knowledge, because I have had dealings with the buildings, that there is scarcely a building in that street that has been a success and that has paid the owner a reasonable interest on his outlay. Then Queen Victoria Street in the City. The Act for that was obtained in 1862. Enormous sums of money were spent on the buildings all through that street, and within my knowledge many very heavy losses have been sustained, and up to the present day a great many of the premises do not realise much more than the ground rents that are paid for them.

Another case was also cited by Mr. TEWSON in reference to a street which has gained unusual interest during the past week:—

Hatton Garden, which is at the base of the Holborn Viaduct, going west, was long the seat of the principal diamond and jewellery trades in London, the wholesale trades. When the Holborn Viaduct was made we had a great deal of business in Hatton Garden at the time, and we advised owners not to grant more than seven years' leases of

their premises in Hatton Garden, believing that the Holborn Viaduct would probably improve Hatton Garden. Your lordships will remember the approach then from the City down Snow Hill was a very awkward one, and we thought that the approach being improved by this Viaduct would give better access and necessarily would increase the value. We find now that instead of doing that, the properties are lessened in value, and that a large part of the diamond market has gone upon the Holborn Viaduct itself. These large buildings have very numerous upper floors; the shops let very readily for trade purposes, for retail tradesmen; but there is a difficulty in getting tenants for the upper floors; and, therefore, they have been offering them at low rates, and a great many of the principal diamond merchants have gone there, to the prejudice of the old market, which was in Hatton Garden. That is an illustration that bears on the question, because if ever there was an improvement in London that would be called a local improvement as well as a metropolitan one it was the Holborn Viaduct. All the streets going from Snow Hill were very difficult of access, but now they are easy to get at.

If anybody should say that the examples were not fairly selected, evidence was given that a similar experience was found elsewhere in the Metropolis. Mr. F. W. HUNT proved from the rate-books that Whitehall Place, since it ceased to be a *cul-de-sac* by the opening of the Thames Embankment, has not increased in value. Mr. T. B. WESTACOTT supplied official returns of the valuation of a great many houses that might be supposed to have received much benefit from the Kentish Town Road Improvement. We can only give the totals. Houses in Kentish Town Road, which in 1877 were valued at 3,354*l.*, have increased to 3,708*l.*, those in Clarence Road have increased from 543*l.* to 556*l.*, and in Castle Road from 763*l.* to 818*l.* What is remarkable is that a higher valuation was put down after the improvement, but it had to be diminished, and practically the valuation of 1894 corresponds with that of 1877. In many cases where the rate-books show an increase of value, Mr. HUNT offered an explanation which merits attention. He said that "such increase does not in my judgment arise so much from the public improvement as from the remodeling the old premises for a better and more convenient occupation, or their rebuilding, and then the yearly extra value put upon them is only a return upon the new outlay upon the premises rather than caused by the public improvement." Everybody knows that the system of assessment in London is not severely scientific. Perhaps one of the consequences of the adoption of betterment with all its uncertain and remote qualities would be the adoption of a new system of valuation.

Although the new thoroughfares are not found to be very profitable, they often have the effect of diminishing the value of property in their neighbourhoods. Mr. VIGERS says that in Little Earl Street, which was a valuable property before Queen Victoria Street was opened, he has to greatly reduce the rents when granting new leases. He has also found that in the neighbourhood of Charing Cross the business of the small shopkeepers has been destroyed, and some of the tenants have been ruined. In Manchester the experience has been no less remarkable. The Deansgate Improvement was apparently most desirable, for a narrow street was increased to a width of 60 feet. But the sites for new buildings which the Corporation retained were taken up during twenty years very slowly, and some are still vacant. The Corporation price ranged from 24*l.* to 40*l.* a square yard, and the prices realised were 17*l.*, 18*l.* and 20*l.* Mr. SINGTON, an architect who gave particulars, said "that if at the completion of the Deansgate Improvement twenty years ago the land had remained in private hands, and the Corporation had possessed powers to levy a betterment rate, it would have been assessed on an estimated improved value which it is now known has not been realised, and there would not be any means of obtaining an abatement of the rate. If a property owner had at the time compounded for the rate at twenty-eight or thirty-three years' purchase, he would now be a heavy loser." Another case is no less remarkable. In 1873 the plot occupied by the Victoria Buildings was sold by the Corporation for 270,352*l.* It is now covered with buildings which were ingeniously adapted to utilise all the ground. The net rent derived from the property is 7,741*l.*, which is only 1*½* per cent. on the estimated value of the land and buildings, or 482,582*l.* In spite of the improvements which have taken place in Manchester and the numerous buildings erected, the valuation of the township, which was 1,503,000*l.* in 1878, was last year only 1,498,000*l.* These facts suggest how much

injustice can be done by attempting to fix valuations of property at a future period from data which are only applicable to the present. Mr. BRIDGFORD's evidence was corroborative of what takes place in Manchester. He considered that the creation of sites was not enough to excite enterprise, for "where new streets are opened out, and where it is expected enhanced values will accrue to properties that are left, we find almost invariably that unless you can put new buildings on the land which is left, and thereby utilise it, the position is the same after the improvement as it really was before." The surveyor's evidence is, in fact, as strong an argument as could be devised for the necessity of waiting until experience has demonstrated that an "improvement" has made property contiguous to it more valuable, and to a degree that can be equitably assessed.

It should be remembered that indefinite language has had an influence on this subject as on most others. In London and other large towns an improvement is sometimes interpreted as being almost synonymous with the demolition of houses and the construction of wider streets. The operations facilitate traffic, and therefore the new roadway can be considered as an improvement, but it does not follow that the amount of business transacted by the inhabitants is always increased, and unless there is an increase shopkeepers cannot regard the transformation as an improvement. The remarkable fact was pointed out by Mr. TEWSON that for business purposes narrow streets are preferable to wide streets, and he referred to Bond Street as an example. People walking on one side could easily see what was exhibited in shop windows on the opposite side, and the distance to be traversed in crossing was so short, it could be undertaken by timid people. In the neighbouring Regent Street the loss of these advantages was not compensated by width or showiness. In wide streets people also fall into the habit of preferring one side for their perambulations, and when that is the case custom is not equally distributed. It is a favourite practice for some enthusiasts to lay down lines of broad thoroughfares on maps of London, and to revel in the fine scenic effects which would be visible. There is no doubt business would be disarranged and probably diverted into new hands by the alterations, but whether any great advantage would be attained beyond allowing the traffic on wheels to pass quicker is doubtful. Mr. WESTACOTT went so far as to assert, "the wider the street is the worse the trade is for that locality." That, perhaps, may be taken as rather strained if applied universally, but it indicates that gracious promenades are not profitable in proportion to their largeness when compared with streets of another class. Speaking of his own experience in the north-west of London, he was able to say:—"I have known places in my own parish where it has been proposed to widen a street, and where we have widened it, where there was a good trade done beforehand, when the widening had taken place the trade has been sent away to some other locality."

Cases may arise where the enhancement of the value of property in the neighbourhood of a public improvement is manifest, and it is only equitable that special contributions should be asked from the owners. But generally it will be found that the improvement is only problematical. In such cases it would be absurd to act on the opinion of a committee of a town council or their officers. Besides giving the fullest notices of the amount to be claimed and within a reasonable time, the authority should announce a readiness to purchase the property at its market value before the improvements were undertaken. Where the owner prefers to retain his property but demurs to the fairness of the amount charged, we suppose there is no economical way of settling the question. It would have to be settled by arbitration or by a jury, and as going to law with a corporation is a serious affair, probably the majority of people will prefer as the lesser of two evils to submit to the claims. Few who own property are, under the new arrangements, likely to pray that public improvements will approach them.

Mr. C. E. Whitworth, of Birmingham, has been appointed head-master for the School of Art at Newcastle-under-Lyme, in place of the late Mr. J. P. Bacon.

THOMAS YOUNG AND JEAN CHAMPOLLION.

THE modern study of Egyptian archæology has had its origin in two undertakings, which were as unlike in their character as is possible. One was the publication of the catalogue of Egyptian coins in the Borgia collection in Velletri by GEORG ZOËGA, the Jutlander, which appeared in Rome in 1787, and which ten years afterwards was followed by his folio on the obelisks. The other cause was the invasion of Egypt by the French Republican army under BONAPARTE in 1798, and the inquiries he ordered to be undertaken by a commission of savants. The work of the Frenchmen attracted more attention, and scholars attempted to pierce the darkness which had so long rested on Egypt.

At the time when BONAPARTE was telling his troops that forty centuries were looking down on them from the summits of the pyramids, JEAN FRANÇOIS CHAMPOLLION was a boy of eight attending school in Figeac, a town which lies midway between Cahors and Aurillac. An obelisk in it is the fitting memorial of their townsman. When he was seventeen he found his way to Paris, and there, partly from his own inclination and partly on the advice of his elder brother, who was a scholar, he began the study of Eastern languages, Coptic and Egyptian archæology. DENON's fine work on the antiquities had already appeared, and the "Institut du Caire," founded by BONAPARTE, by its communications was aiding to promote that interest in the ancient kingdom which the expedition had excited. Egyptology was fast becoming fashionable, and it was wise to devote CHAMPOLLION to the subject. He resolved to bring out a work descriptive of Egypt under the PHARAOHS as the first-fruits of his studies. As he was not wealthy, he accepted a professorship of history in Grenoble, as well as the post of librarian, in order to obtain a livelihood while his book was in preparation. It appeared in 1814, when the author was in his twenty-fourth year.

The preface contained a remark which was significant, as expressive of the hope which then inspired him. He expressed confidence that the hieroglyphics which were seen on the monuments he described would one day enable the world to realise the sounds of the Egyptian language and understand the thoughts of the people. At that time DR. THOMAS YOUNG, who was one of the ablest men of science in England, was studying the subject. It was known from an early age that some hieroglyphics were symbols, as when a crescent stood for the moon and a circle for the sun. But that was not a sufficient clue to what is seen on the walls and on mummy cases. ZOËGA believed some of them were expressive of the sounds of words. He was not fortunate in realising the value of the Rosetta stone which a French soldier had discovered in 1799. It recorded a decree of PTOLEMY V. in Greek hieroglyphic and demotic characters. YOUNG discerned the relations of the three inscriptions on it. Having found the characters which expressed "Ptolemaios" in Greek, he worked out the phonetic value of the Egyptian signs, which was no easy task, for a hieroglyph sometimes only stood for the first letter of a syllable. That part of the stone was also injured. YOUNG announced his discovery in an article published in 1819, so we may assume it was arrived at earlier. In 1821 CHAMPOLLION opposed the theory and said it was the practice to use certain characters merely as a sort of shorthand for the hieroglyphs, and that the former as well as the latter expressed objects and not sounds.

The incident must have been one of the utmost anxiety for CHAMPOLLION. His whole career seemed to depend on the time-worn stone. He had already suggested that there was some correspondence between Egyptian symbols and sounds. As every scholar does under similar circumstances, CHAMPOLLION supposed the interpretation was a preserve of his own which all men were bound to respect. Without any permission from him, he found an Englishman and a Swede (AKERBLAD) had invaded his property and claimed it as their own. His irritation was seen in his pamphlet of 1821, in which he abandoned, as it were, his own theory, for to say that "L'écriture hiératique" was an abbreviated system of hieroglyphics was to give up phonetics altogether. Fortunately, CHAMPOLLION's love of Egyptology was too strong to allow him to remain perverse.

In September 1822 he was living with his brother in

Paris, and both were daily occupied at the French Institut. One day JEAN came in an excited state to his elder brother, who was in bed, and cast a heap of papers before him, saying he had solved the difficulty. He was scarcely able to give more than a few words of explanation, and then he collapsed. The papers contained an essay on "The alphabet of the phonetic hieroglyphics employed by the Egyptians when inscribing the titles, names and surnames of Greek and Roman sovereigns on the monuments." Two days afterwards (September 17, 1822) it was read before the Academy of Inscriptions and Polite Literature, and was immediately published under the form of a letter to M. DACIER, the secretary. Practically it was a retraction of what CHAMPOLLION had written in his pamphlet of the preceding year about YOUNG's suppositions, but his countrymen were too delighted to trouble themselves about the claims of the English discoverer. CHAMPOLLION was supposed to have created a new Egyptian dynasty that would endure for ever, and consist of French scholars alone.

After the rejoicings were over doubts began to arise, and the subject became an excellent theme for controversy. Dare we say that people were disappointed? A key was found, but the mysteries that were revealed did not seem to be worth either the trouble which was taken to conceal or to find them. Europe had formed its notion of the ancient Egyptians from their works of art, and their buildings seemed to represent a people who aspired after the sublime. In the course of seventy-two years, what has been discovered of thoughts expressed in hieroglyphic or demotic characters which has helped to make the world wiser? Scholars who have laboriously interpreted inscriptions naturally place a very high value on every trifling statement they have revealed. But if to allow experiments in engineering the temples of Egypt were cleared away, would future generations be awed by any composition of the priests or scribes? The authors may have considered their work was superior to the artists'; but that is a prepossession which still remains.

CHAMPOLLION did not attempt such translations as can now be made. He was supposed to have gone far when he made out that his alphabet was applicable to the names of native as well as Greek and Roman rulers in Egypt. All that could be offered to reward research was therefore only barren inscriptions, or parts of them, for some doubted whether CHAMPOLLION was able by his method to translate a whole sentence. The results were therefore not comparable with the free interpretation which fancy could supply with the aid of the hieroglyphics without the assistance of linguistics.

Humble as CHAMPOLLION's discoveries must now appear, they were sufficient to bring him honour. LOUIS XVIII. considered it was a duty to be present when they were discussed. CHARLES X., when his turn arrived to be seated on the French throne, purchased a collection of antiquities at a costly price—they might have been secured for the British Museum—in order that the country should be able to utilise CHAMPOLLION's gifts. Wherever there was a museum with Egyptian remains in it he was invited to give his opinion on them, and his journeys were like royal progresses. Although CHAMPOLLION was described as a Jacobin, who was without respect for the Bible, POPE LEO X. entered into negotiations with him for the production of a noble work on the Roman obelisks, which, however, was never published. Much as he was honoured in Italy, he appears to have been discontented with the routine to which his position was subjected, and he lamented that he was not brought up to a trade. CHAMPOLLION was a nervous man, and may have felt he had accepted a task which was beyond his abilities.

The king having decided that the SALT collection which he had secured was to be placed in the Louvre, CHAMPOLLION was made director. He lost no time in arranging the numerous objects. In order to enrich it he did not hesitate to part with the gifts which he had received from foreign courts, and which were precious as examples of Egyptian art. There was a prejudice against him among academicians, but in compensation he was appointed one of the officers of the royal household.

When CHARLES X. imagined he was competent to take up the archæological work which BONAPARTE was compelled to abandon in Egypt, CHAMPOLLION was placed at

the head of the expedition. The Grand Duke of TUSCANY sent a second party under the control of ROSELLINI. Both arrived at Alexandria in August 1828. The ruler of Egypt, who was MEHEMET ALI, co-operated with them. CHAMPOLLION endeavoured to make the most of his opportunities, which were always liable to come to an end by any trivial error of a diplomatist in Paris. He was indifferent to climatic risks, and when he left Egypt at the end of 1829 his days were numbered. He died of paralysis on March 5, 1832.

France can point to many of her sons who achieved much in a brief period, and JEAN CHAMPOLLION should be included among them. He was a pioneer of Egyptology and his knowledge could not be otherwise than limited. At first he wandered in the mazes of Egyptian history, then he endeavoured to pluck out the heart of the mystery of hieroglyphics, so that up to 1824 he was only a sort of bookman. When he went to Turin he became acquainted for the first time with Egyptian art, and the nine months he spent in Turin formed the earliest period in his career when he was able to obtain an objective education. Afterwards his time was frittered away during four years, and he must have felt a sense of relief when he stood for the first time on Egyptian soil and could pursue his studies satisfactorily. CHAMPOLLION no doubt had the defects of his qualities. As he attained his position by means of books and inscriptions, as if he were a successor to the old scribes, he may be pardoned if he sometimes attempted to interpret papyrus records by courageous guessing. The great people around him would consider him an impostor if he hesitated to explain anything Egyptian. CHAMPOLLION, like many of his contemporaries, was a victim to the circumstances of the time. Among his incomplete works are the "Egyptian Pantheon" and the "Monuments of Egypt and Nubia," which are evidence of his courage.

There was no distinction awaiting THOMAS YOUNG in England for having shown the way to CHAMPOLLION and others. His occupations were so varied and his talents so versatile, none of his countrymen would be surprised if he wrote a treatise on the music of the spheres as well as on Egyptian hieroglyphics. At the time he announced his discovery he was editor of the *Nautical Almanac*, and as his calculations were criticised by men who were not familiar with astronomy, we suppose, as a philosopher, he was thankful that his interpretation of the Rosetta stone was disregarded. YOUNG eked out a living in several ways, but as he was wanting in assurance he was not thought to be successful in any of them. His fate was a striking contrast to CHAMPOLLION'S, but if the two men could have changed countries probably the contrast would be still more remarkable.

THE FRESCOES OF PINTURICCHIO.

THAT part of the Vatican which still bears the sinister name of Borgia, says the *Weekly Register*, was the dwelling-place of Alexander VI. It is a relatively small set of apartments, comprising six rooms, but its frescoes have made it famous. They are Pinturicchio's best work, and have kept all the sharp brightness of colour which Pinturicchio's paints always possessed and are upon the vaultings of the ceilings. As it was unusual to paint the ceilings so elaborately and not the walls at all, the presence of frescoes on the sides of these noble halls has often been suspected. It has not been the manner of the gorgeous pontiffs to cover over works of art, but it was surmised that the successors of Alexander VI. might not improbably have found something in the frescoes rather too little austere for the rooms of a pontiff. This age, however, is undaunted in the pursuit of art or archaeology, and it was recently resolved that, be the discoveries what they might, the surface colour should be removed. First it was necessary to clear the principal room of some thousands of books; next, the tiled flooring was completely restored, and then the walls were scraped. Several thicknesses of colour wash were found, and soon the presence of designs and colours was made manifest. The search party were cheered, moreover, by the discovery that neither designs nor colours were of a nature to shock the most sensitive feelings—not even those of the *Figaro*. An emissary from that sprightly paper penetrated a few days ago into the Sala Borgia, and had the happiness of ascertaining that its frescoes were every way better than its name. They are, so far, only partly uncovered, the work being necessarily one of difficulty and time, but there seems to be no doubt amongst experts that they are from the hand of Pinturicchio. In the first room, called the Hall of the

Pontiffs, from the names of three or four popes inscribed upon the vault, the artist entrusted with the labour—M. Seitz—has restored to the light of day a series of comparatively small landscape subjects, enclosed in panel frames which have greatly suffered. Nor are the paintings all. Between the framings are caryatides of great height and beauty, the work of Pierino del Vaga and of Giovanni d'Udine. The second room, Sala della Madonna, proves to be painted throughout by Pinturicchio. The scheme of decoration is superb. All round beneath vaulting runs a decorative frieze of brilliant colours. The walls simulate a hanging of tissue covered with capricious golden arabesques, the lower parts being painted—in a taste more worthy of modern Italy—with an illusion of furniture, cabinets with half-opened drawers showing their contents and bearing chalices, candelabra, censers. The third hall—Sala dei Santi—is painted with an imitation of tapestry. The painting of the fourth has greatly suffered, its walls having been excavated for the fastening up of bas-reliefs and lapidary inscriptions. These naturally made very short work of the unsuspected frescoes. The fifth and sixth rooms have fared almost as ill, but in the embrasures of the windows some traces of fine design have been uncovered. All those persons to whom the word restoration is more maddening than is the matador's mantle to the bull—and they are right to feel it in that way—will be appeased to hear that his holiness has given stringent orders that nothing but uncovering is to be attempted in any single instance. The Pope has besides full confidence in the discretion and skill of M. Seitz, whom he visited last week at his work and congratulated on its progress. "I hope," said the holy father, "that you will be able to finish this important labour so that by the end of next year the public will be able to admire the Vatican frescoes of Pinturicchio as they do now the Vatican frescoes of Raphael."

BIRMINGHAM AND MIDLAND INSTITUTE.

THE members of the Archaeological Section have just made the last excursion of the season into Cheshire. The party drove to Moreton Old Hall, where a rich treat met the eye of the antiquarian. This is, perhaps, the largest half-timbered building in the kingdom. It occupies three sides of a square, the fourth side being a garden, and the whole being surrounded by a moat, now crossed by a stone bridge, but in earlier times, no doubt, by a drawbridge. It was gratifying to observe the care which has been taken to prop up and preserve this interesting building. A pleasant drive brought the party to the large and handsome church at Astbury, where they were met by Mr. Lynam, who has made a special study of it, and explained its interesting features. On reaching Congleton, the party were received at the Town Hall by Mr. Head and the town clerk (Mr. A. S. Sheldon), who kindly exhibited and explained some fine charters, the Cromwellian mace (a very fine specimen), the signature of Bradshaw the Regicide (once mayor), and three belts, bearing bells, once used by acolytes, who ran round the town on the feast day of the local saint.

BERWICKSHIRE NATURALISTS' CLUB.

THIS club has just held its fifth and last field meeting for the season at Gordon, under the guidance of the Rev. Thomas Porteous, Gordon. On arriving at Mellerstain the mausoleum of the Baillie family was examined, and the grave viewed of the famous Lady Grissel Baillie, daughter of Sir Patrick Hume, of Polwarth. It was this lady who heroically found means of conveying food to her father while he was concealed in the vault of Polwarth Kirk in the persecuting times. Mellerstain House was afterwards inspected, and the family portraits which adorn its rooms. The party also walked through the grounds and gardens.

MANCHESTER AUTUMN EXHIBITION.

THIS year's exhibition of paintings in the Manchester Corporation Art Gallery comprises a much smaller number of works than has been seen in the rooms in Mosley Street on some previous occasions, the reason apparently being that the authorities decided to interfere as little as possible with the growing claims of the permanent collections in the same building to uninterrupted free access of the public throughout the year. The limitation of the number of works in the autumn exhibition has not, however, sufficed to prevent some regrettable instances of "skying." Perhaps the dissatisfaction annually felt at the results of attempting to combine in the same building (the old Royal Institution) a permanent gallery of art and an annual representation of the art of the year, will lead before long to the provision of accommodation for the latter on some site not necessarily so central, but better fitted in other respects for the due display of paintings and sculpture. In the meantime, the hopes of the munificent donors of the property, who

presented their fine building by Sir C. Barry, with its contents, to the city Corporation twelve years ago, can be but partially fulfilled, since the more the permanent collection prospers, the less chance there is of the temporary collection being adequate to its purpose. This year's exhibition includes pictures by Sir F. Leighton, Messrs. G. F. Watts, Aumonier, East, North, Hacker, Shannon, Hemy, D. Murray, Goodall, Poynter, Leshe, Moore, Brett and other distinguished contributors.

TESSERÆ.

Varieties of Spires.

A GRADUAL and progressive transition from the mere peak or pyramidal roof to the slender tapering spire cannot be clearly traced. On the contrary, some of the earliest deviations from the simple pyramidal form appear to have produced uncouthness rather than lightness; for although much greater loftiness upon the whole was so occasioned, the appearance of it was reduced by the sides of the tower being made to terminate in gables cutting into, and therefore partly cutting off, the base of the pyramid or spire itself. Many of the earlier German edifices contain examples of this peculiarity—one almost confined to them; among others the cathedrals of Worms and Gelnhausen, the church at Andernach and that of the Apostles at Cologne exhibit many varieties of spires, or rather spire roofs, springing up from gables at their base, and in some the gables are so large and rise up so high that the appearance of spire is almost entirely lost. Such is the case with the pyramidal covering of the square tower at the west end of the church at Gelnhausen, of which the portion above the gable forms a mere capping. The same church offers other specimens of the kind, there being besides the one mentioned a spire over the intersection of the transept, one over the apse at the east end and two others over the towers adjoining it. All these are polygonal, but otherwise differ, except that those to the towers are similar to each other, both in dimensions and proportion—that over the apse being not quite so high as it is broad, while that over the transept is one diameter and a half and the two others three diameters in height. They are all gabled at the base, and their ridges correspond with the apices of the gables, so that the sides or faces of the spire alternate with those of the tower, which last circumstance is almost peculiar to the earliest German spires. Another distinction belonging to them is that, except gables or pediments, they have nothing at their base—neither parapet nor pinnacles of any kind, which would serve at once as a finish to the tower and as enrichment to the lower part of the spire. This is so different from the usual mode that in this country a spire set immediately upon a tower without any parapet, &c., at its base is technically described by the term broach.

The Greek "Running Path."

The stadium consisted of a flat area, surrounded by raised seats, and was made either in a spot which had by nature the required shape, or in the side of a hill or on a plane. In the last two cases the stadium was constructed by forming a mound of earth of the proper shape and covering it with stone or marble for the seats. The second of these three forms was the most common. Of the third we have a fine example in the Panathenaic stadium at Athens. The area of the stadium was oblong, terminating at one end in a semicircle. At the other end it was bounded by a wall, at the two extremities of which were the entrances, one on each side of the stadium. Here was the starting-place marked by a square pillar in the middle of the breadth of the area. Another such pillar was placed at the other end of the course, at the distance of a stadium from the former, and at or near the centre of the semicircular end of the area. This pillar marked the termination of the simple foot-race, but in the Diaulus the runners turned round it and went back to the starting-place; in the Dolichus they turned round both pillars several times, according to the number of stadia of which the course consisted. The end of the course was also marked by a pillar. Halfway between these pillars stood a third. On the pillar at the starting-place was inscribed the word "Excel," on the middle one "Hasten," on the one at the goal "Turn." The semicircular end of the area was thus not used in the foot-race. Here probably the other gymnastic contests took place, for though the stadium was originally intended only for the foot-race, yet as the other contests came to be added to the games they also took place in the stadium, except the horse-races, for which a separate course was set apart, shaped like the stadium, but larger. Among the seats which surrounded the area a conspicuous place, opposite to the goal, was set apart for the three Hellanodica, who decided the contests, and who entered the stadium by a secret passage. Opposite to them, on the other side of the stadium, was an altar, on which the priestesses of Demeter Chamyne sat to view the games. The area was ornamented with several altars and

statues. The position of the stadium was sometimes, but not always, in connection with the gymnasium. Under the Romans many of the Grecian stadia were modified so as to resemble the amphitheatre. There still exist considerable ruins of stadia, among the most remarkable of which are those at Delphi, Athens, Messene, Ephesus and Laodicea.

English Oak.

The species of oak known as *Quercus pedunculata* has the reputation of being the true British oak. The timber of the oak, like all other wood, is materially affected by the nature of the soil in which it grows, and this has probably given rise to the often repeated assertion that Sussex oak, which chiefly consists of *Q. pedunculata*, was the best that could be employed in shipbuilding. Experiments as to strength and toughness have shown that there is no material difference between it and *Q. sessiliflora* in those respects, and the durability of the wood of the sessile-cupped oak is attested by the well-known fact that the roof of Westminster Hall is constructed of it, and not of chestnut, as has been sometimes said. It has been found to be the timber of some of the most ancient buildings in this country and elsewhere. An immense beam in an old Shropshire building, called Stone House, was *Q. sessiliflora*, and the oak usually obtained from bogs, where it must have lain for centuries, has often proved to be the same. The wood may be easily known by its medullary rays, or silver grain, being so far apart that it cannot be rent, and this gives it quite a peculiar aspect. *Q. sessiliflora* is found all over England now, but nowhere in much quantity. It, however, is more abundant in the West than elsewhere, and constitutes the greater part of the oak of North Wales. It is a much handsomer plant than *Q. pedunculata*, and grows considerably faster, and therefore is by far the most advantageous kind for the planter. Its comparative scarcity at the present day may perhaps have arisen from its having been felled in preference as long as any of it remained in the ancient forests, which its superiority in size to the other species would render probable, and not having been replaced, it would thus become gradually exterminated. It appears to be still common over all the south of Europe, where, however, it is not uncommonly mistaken for the last.

Heidelberg Castle.

The Elector Frederick V. was born in 1596, and succeeded his father in 1610. In 1613 he married the Princess Elizabeth, daughter of James I. king of England, she being the same age as himself. In 1614, having attained his majority, he took upon himself the government of his palatine territories. In 1619, being looked upon as the head of the Protestant cause, he was elected King of Bohemia, and in November that year he, with his wife and a numerous suite, left his capital and palace at Heidelberg for Prague, there to accept the proffered crown, and assume the state of King of Bohemia. He was destined never to return to his former home. He was very fond of splendour, and through his great passion for building during his short reign from 1614 to 1619, he carried the beautiful castle palace of Heidelberg to its greatest extent of magnificence. In December 1619 he and his wife were crowned king and queen of Bohemia; but early in 1620 he was besieged and defeated at Prague, and obliged to fly with the queen and family and a few friends, and they were both fugitives and sojourners in strange lands for the remainder of their lives, for he was put under the ban of the empire, and in 1623 deprived of his hereditary possessions. The castle had been founded at an early period, but the Elector Lewis V., who reigned from 1508 to 1544, made great additions to it, amongst which he raised that portion of the fortifications called afterwards the Stüchgarten, and built at the north-west corner the so-called Big Tower. His brother Frederick II. (1544-56) also made additions, building at the north-east corner the Octagon Tower on an earlier circular base. His successor, Otto Heinrich (1556-59), erected the beautiful buildings which go by his name. John Casimir (1583-93) caused the first great tun to be made in 1591, and erected the building to contain it. Frederick IV. (1593-1610) added greatly to the castle, erecting the Frederick buildings with the terrace in front, the upper storeys of the Octagon Tower, the Library Tower and the (now called) Blown-up Tower. Frederick V. between 1614 and 1619 carried the structure to its greatest extent of splendour. He employed Von Caus, the architect to the king of France, to lay out the royal gardens. By the architect, Charles of Nuremberg, he raised the Big Tower, building on the top of it a large circular saloon. He erected on the north rampart the English buildings, as the lodgings for his English bride, and the ruins retain the name to this day. He transformed the old chapel, which occupied a portion of the castle called the Rupert building, into the royal hall, the chapel having been removed into the Frederick buildings. He substituted a platform with a balustrade for the high roof of the building where the tun was kept, and connected them all with the English buildings. He filled up the round bastion, substituting a handsome balustrade

for the parapets of the Stüchgarten, at the extremity of which he built the aviary and the Elizabeth Gate, so called in honour of his wife. He joined what was called the small garden with what was called the Süchgarten, connecting them with the English buildings by a drawbridge. These works were all but completed by 1619, when he and his court went to Prague, and the Thirty Years' War put a stop to all further proceedings.

Flaxman on Romney.

The following are extracts from Flaxman's character of the works and genius of Romney:—"When Romney first began to paint he had seen no gallery of pictures, nor the fine productions of ancient sculpture; but then women and children were his statues, and all objects under the cope of heaven formed his school of painting." "His genius bore a strong resemblance to the scenes he was born in; like them it partook of the grand and beautiful, and like them also the bright sunshine and enchanting prospects of his fancy were occasionally overspread with mist and gloom." "Few painters have left so many examples in their works of the tender and delicate affections, and several of his pictures breathe a kindred spirit with the *Sigismonda* of Correggio. His cartoons, some of which have unfortunately perished, were examples of the sublime and terrible; at that time perfectly new in English art." "His compositions, like those of the ancient pictures and basso-relievos, told their story by a single group of figures in the front; whilst the background is made the simplest possible, rejecting all unnecessary episode and trivial ornament, either of secondary groups or architectural subdivision. In his compositions the beholder was forcibly struck by the sentiment at the first glance, the gradations and varieties of which he traced through several characters, all conceived in an elevated spirit of dignity and beauty, with a lively expression of nature in all the parts. His heads were various; the male were decided and grand, the female lovely; his figures resembled the antique; the limbs were elegant and finely formed; his drapery was well understood." "Few artists since the fifteenth century have been able to do so much in so many different branches."

Transformations of Statues.

The ancient gods and spiritual beings when represented by the artists become personified abstractions, which in order to be at once recognised must perpetually retain their appropriate characteristics. In the eyes of the sculptor Venus is only "Love." He must therefore attribute to her all the modest, bashful beauty, all the graceful charm, which are the attraction of a beloved object, and which therefore are included in the abstract idea of love. If there is the least deviation from the idea we can no longer recognise her form. Beauty, but clothed with majesty rather than bashfulness, becomes at once not a Venus, but a Juno. Charms, but charms commanding and rather manly than graceful, give us, instead of a Venus, a Minerva. It is no wonder, therefore, that the story by Pliny, in which he relates how Agoracritus, on being vanquished in the contest for the prize with Alcamenes, changed his Venus into a Nemesis, has been a subject of difficulty to several critics and commentators on Pliny. It was not easily understood how, by a slight change, he could convert a Venus into the terrible goddess Nemesis. Sillig, in his remarks on the subject, says:—"It appears certain that Agoracritus made a statue of Venus, and, mortified to find it deemed inferior to that of Alcamenes, made some slight alteration in it, and sold it to the people of Rhamnus. Many learned men, indeed, have doubted whether a statue of Venus could be modified so as to represent a Nemesis, and they have hence inferred that this part of the narrative of Pliny is fictitious, but in adopting this conclusion they seem to have acted inconsiderately. For they have supposed that the Nemesis Rhamnusia was similar to the statues which now remain, having the arm half raised so as to form an angle, and the robe partly withdrawn from the breast so as to expose it to view, but this opinion has been by some successfully called in question. They have, however, committed a still more serious error in not attending to the difference between the statues of Venus formed in different ages. It would be indeed absurd to suppose that the Venus of Praxiteles, of which the Venus de' Medici is commonly supposed to be a copy, could be transformed into a Nemesis. But who is not aware that, in the earlier times of Greece, the statues of all gods and goddesses were very similar, and that goddesses in particular were at the first far less distinguished by the difference of their persons than by their different external appendages? Thus the Venus of Agoracritus must have been exhibited with a certain peculiar dress which would strike the beholders, and as there was not a marked difference between the faces of the two goddesses, the artist had only to alter the dress and the other external appendages according to the ancient mythology. These appendages Pausanias accurately describes, but without explaining their mythical meaning, so that it is impossible to ascertain the reference of many of them. We know also, from many vestiges left on statues still extant, that ancient marble statues were frequently adorned with gold and silver bracelets, earrings,

garlands, goblets and similar ornaments, so that Agoracritus, in transforming his Venus into a Nemesis, had only to change the golden decorations." The story is curious, but Pausanias gives a different account of the origin of the Rhamnian Nemesis. He says:—"The Medes, never dreaming that any obstacle would stand between them and the capture of Athens, brought to Marathon a block of Parian marble to make a trophy of. This block Phidias worked up into a statue of Nemesis. On the head of the goddess is a crown, having on it stags and small figures of Niké; one hand holds the bough of an apple tree, and the other, or right hand, holds a bowl, on which are figured Æthiopians. What is meant by these Æthiopians I can neither conjecture myself nor can I admit the opinion of those who profess to understand it, and who say that the reason of their being figured on the bowl has to do with the river Oceanus, for it is by that river the Æthiopians dwell, and they add that Oceanus is the father of Nemesis." Zoega may or may not be justified in throwing discredit on the story of the block of marble, and, indeed, the divergence between Pausanias and Pliny seems to show that very little reliance can be placed on either of them in the matter of this statue. Figures of Nemesis holding the apple-bough, as stated by Pausanias, are not unfrequently found on ancient remains, as, for example, on the Chigi Vase. A fragment of a colossal head, presumed to be that of the goddess, was found at Rhamnus, and is preserved in the British Museum; it still shows the holes for fixing a metal crown.

The Function of Painting and Sculpture.

In times that are now long past it was often the province of the painter's art to teach facts as well as to create emotion towards beauty. There was then a scope for much elaborate art to be painted in order that an illiterate public should learn history and religion, and be impressed by notable passing events. But those times are over. Now photography and cheap engravings portray and endlessly repeat scenes of passing interest, and can procure for thousands the likeness of any place or person of public interest. Besides, every kind of literature is within everyone's reach, that describes in words the feelings and facts of life. Now, art should maintain her highest level or cease to expect a distinct place in the world's growing and better interests. Science will probably soon discover a means of photographing colour, and then the realistic school of art, which aims only at giving the outward aspect of an object artistically arranged, without any reflection of the artist's nature, will be completely beaten on its own ground. But that art which emanates from a poetic preference—the highest art, in fact, painted and sculptured poetry—will not only retain the interest which it always has inspired, but will be more distinctly recognised as belonging to the same class of intellectual interests as do the best writings in prose and poetry, and will be recognised as demanding the same class of emotional response as that which the best music excites. If the mass of so-called art yearly produced on semi-manufacturing principles ever settles down into its right place, a greater lucidity in the mind of the public as to what makes art might be hoped for. The general intellectual world might learn perhaps how mistaken it is to demand even from the highest art that it should feed the intellect without first touching the emotional qualities and inspiring a satisfaction in true beauty of line and colour; and, on the other hand, the so-called artistic world might well cease from demanding and desiring solely that a limited kind of emotional pleasure should be excited by art, without insisting that such emotion should lead to a satisfaction also of the intellectual and higher faculties. If such a reform in art feeling ever came about, then painted and sculptured poetry would probably be recognised as the art which alone justified the immense and difficult toil which any painting and sculpture of a really finished and complete character necessitates.

Setting Out Ornament.

All schemes of ornament should be set out on a geometrical basis. As a rule floral ornament on the same plane should spring from one root or from two roots, one on each side of the centre. For superposed ornament on two planes the lower pattern should be small and form a ground for the upper one, which should be larger and stiffer, as in the text work of the Saracens; if a third plane is superposed a geometrical pattern is the best. Ornament should be strictly confined to the spaces enclosed by the structural lines. The examples of plates where one pattern runs over the bottom bevel and edge are to be avoided. In the case of curved forms each ornament should be confined to such part of the curved surface as will not cause its distortion. Where ornate friezes, bands or panels are used to ornament portions of one large surface the intervening parts should be plain or covered by simple forms in the shape of spotting, powdering, lining, striping or matted work and should not distract attention from the main ornament. In certain cases this effect has been attained by making the ornament of the subsidiary parts in such low relief that it appears at a distance a mere roughening of the surface.

NOTES AND COMMENTS

THE present is hardly an opportune time to be exacting in asserting rights to property in ancient remains which do not stand in private demesnes. An action of that kind usually compels sceptics to inquire into the origin of property in landed estates, and they conclude that the titles to them are as shadowy as those relating to examples of art which have not a market value. How can a substantial claim to the ownership of the preaching cross in the High Street of Leighton Buzzard be made out? It was restored in 1620 by money to which all the people were obliged to contribute; and for a still longer period, probably from the reign of EDWARD III., it was considered to be public property. As late as 1852 it was again restored by subscription. The cross is surrounded by a palisade, and the keys of the gate are held by the local Public Lands Trustees. Yet the lord of the manor claims the ownership of it, and it has been included as part of an estate that was offered for sale on Tuesday. Manorial rights are relics of feudalism, and in many cases they cause no inconvenience to the people of the district. Sometimes the authority they confer is held out as a threat, as when it is proposed to demolish a church in order to punish a parson. But happily it is almost without precedent to have a claim set up like the one which is causing commotion in Leighton Buzzard.

THE age of the purple tissue which is supposed to have belonged to CHARLEMAGNE and forms part of the treasure of Aix-la-Chapelle has been the subject of many a stiff controversy among German archaeologists. The qualities of the material are believed with equal confidence to belong to ages that are centuries apart. As a sort of compromise the tissue is generally supposed to have been woven in the twelfth century. As the great emperor died in 814, it could not have added much to the dignity of his appearance, nor did a man who was so majestic in appearance require an aid of that kind. An investigation of the subject was lately undertaken by Dr. BORK, who has announced his conclusions for the benefit of the Bavarian Union of Art industries. The inscription on the tissue records that it was carried out in the Zeuxippos or imperial factory of Byzantium under the direction of MICHAEL the superintendent. The factory it appears contained several departments, which were all occupied in preparing the robes and other paraphernalia of royalty. Dr. BORK concludes that the piece in Aix-la-Chapelle was produced between 1180 and 1210 or thereabouts. As it may have been used as a pall at one of the anniversary services for the peace of the emperor's soul, it is easy to understand how in course of time it was supposed to have belonged to CHARLEMAGNE and to be worn by him.

If in England we are providentially preserved from earthquakes, there is a very disagreeable substitute in the subsidences due to mining. A Japanese would be not unlikely to say he preferred to live in Yokohama or Tokyo than in Motherwell or Northwich, for with lattice-work houses there is less risk than with those of stone and brick. In the Scottish town, after a brief cessation, the disturbances appear to have recommenced with vigour. The *Glasgow Herald* gives the following description of the present state of one of the tenement houses:—"The walls at the front of the building are rent from top to bottom, the fissures being large enough to admit a man's hand. The wooden supports which have been placed in the windows are twisted and bent under the strain of the yielding structure, whilst the window sashes are jammed and immovable. Props have been placed to support the gable wall, but it is visibly off the plumb, and it has been found necessary to erect a barricade round that part of the building, as there is a probability of the whole structure collapsing, and thus endangering the lives of the public. Bad as the buildings appear on the outside, the interior is infinitely worse. The ceilings are almost entirely without plaster, a condition of things which has existed for some time; and to prevent the occupants from being injured by the falling ceilings the proprietor has had to fix lengths of cloth along the rafters, in which hang suspended large pieces of plaster, which might otherwise have caused injury or inconvenience to the

householders. The walls of all the houses are likewise in a deplorable condition, there being hardly a yard without a rent or a fissure. An idea of the conditions under which the tenants have had to live may be got from the fact that the cracks in the walls are so large that one tenant can look through into his neighbour's house. In one instance a tenant proceeded to fill up one of these fissures in the wall of his house, and the plaster went right through into his next-door neighbour's bed." It may be added that the building has only recently come into the possession of the proprietor. In Northwich three cottages collapsed last week, as well as a large pumping-station, "a valuable pumping-engine and a quantity of materials disappearing in a chasm 40 feet in diameter and some 20 feet deep." In the salt district there may be some excuse for building houses in a dangerous position, for the subsidences often arise from causes which are remote. But from the evidence which was given lately before a Parliamentary committee, it is plain that in Motherwell, owing to the stringency of the feuing regulations, the people have no choice, and are compelled to live within a limited and unsafe area.

It may not be known generally that a selection of electrotype reproductions of all the finest Greek and Roman coins in the British Museum has been placed on exhibition in the Etruscan saloon, on either side of the entrance to the new Medal-room. The Greek coins, on the south side of the entrance, have been arranged in such a manner as to afford a synoptical view, at once historical and geographical, of the gold and silver coinage of the ancient world, from the invention of the art of coining money, early in the seventh century B.C., down to the Christian era. Every specimen exhibited has been separately labelled and numbered in accordance with the "Guide to the Coins of the Ancients," where full descriptions and explanations of the types are given. The Roman coins, on the north side of the entrance, consist (1) of a rich series of Roman and Byzantine aurei and solidi, ranging from the time of JULIUS CÆSAR down to the fall of Constantinople in A.D. 1453; (2) of a series of silver denarii, &c., of Republican times, classified alphabetically under the Gentile or family names of the monetarii, the dates of issue being added on the labels under the specimens; (3) of a selection of *Aes grave*, showing the successive reductions of the Roman *As* and its divisions in chronological order; and (4) a representative portrait-series of Roman Imperial large brass coins and medallions, comprising the finest specimens from the unrivalled collection of the late Mr. EDWARD WIGAN.

A BIOGRAPHY of GAINSBOROUGH by Mr. W. ARMSTRONG has been added to the *Portfolio* series. The author divides the artist's career into three sections corresponding with his residence in Suffolk, Bath and London. GAINSBOROUGH was one of the self-taught painters, for the instruction he received from HAYMAN was not of much avail, and it is amazing that he was able to make such strides in art at an early date. A letter he wrote to a patron who complained of his handling suggests the scarcity of examples with which he was acquainted. "I don't think," he wrote, "it would be more ridiculous for a person to put his nose close to the canvas and say the colours smelt offensive than to say how rough the paint lies, for one is just as material as the other with regard to hurting the effect and drawing of a picture. Sir GODFREY used to tell them that pictures were not made to smell at; and what made his pictures more valuable than others with the connoisseurs was the pencil or touch." A modern student would be able under similar circumstances to adduce the handling of a variety of masters. GAINSBOROUGH, when repeating the story, was not able to say he had seen a painting of KNELLER'S. Half his life was spent before he was able to study VANDYKE'S treatment. Mr. ARMSTRONG says with truth, "GAINSBOROUGH was a rarer genius than VANDYCK. His art is more personal, more exquisite, more alive with temperament than the Flemings;" but there is no doubt that "when VANDYKE first swam into his ken," a new era was open for the art of GAINSBOROUGH. As is usual, the monograph is illustrated with as fine reproductions as photography can give.

NEW PREMISES, OLD SQUARE, BIRMINGHAM.

AMONG our illustrations this week is a perspective view of the front elevation of the new premises now in course of erection for Messrs. LUNT & Co., warehousemen and haberdashers, who will shortly be removing from their existing buildings in Moor Street, their premises being required in connection with the extensive railway alterations in that district. The new premises will consist of extensive warehouses in the rear, five storeys in height, with a block of shops and offices in the front. The front elevation will have Burmantofts buff terra-cotta dressings, with EDWARDS'S Ruabon red facing-bricks. The work is being carried out by Mr. JOHN BOWEN, of Balsall Heath, Birmingham, from designs and under the superintendence of Messrs. ESSEX, NICOL & GOODMAN, architects, 8 Newhall Street.

A STREET HOUSE.

THIS illustration is a reproduction of a design by Mr. JOHN CASH, of Willesden, which was exhibited this year at the Royal Academy.

WETTON CHURCH.

THE new chancel and choir, &c., shown in the design we publish, has not yet been erected, owing to deficiency of funds, but other works have been carried out, and the reopening took place recently. The body of the church (a large nave without aisles, "churchwardens' Gothic," temp. 1822) was dilapidated, and the walls had to be lowered and a substantial open-timbered roof erected. New flooring of plain bright red tiles and wood has also been laid. New benching has been fixed throughout, stained walnut, and finished in MANDERS'S "flattening" varnish (in place of the customary horrible glister compound). The old pewing has been refixed as wainscotting to the walls. The tower arch was opened to view by the removal of a rickety gallery and screens, which have also been utilised as wainscot. The tower itself is of the thirteenth century (with fourteenth-century parapet), and practically "unrestored," its only disfigurement—a modern "rolled cathedral" window—excluding the joyous sky, trees and birds from those within in the approved Philistine manner. It still needs repointing. It contains a rude ancient oak stair-ladder to the belfry. The new works and repairs have been executed by Mr. J. W. BASSETT, of Hulme End, assisted by Messrs. OVERFIELD, Leek, cabinetmakers, and Mr. STRINGER, Hanley, organ-builder; the velvet curtains and embroidery by the Leek Embroidery Society, and some metal-work by Messrs. ELGOOD, all to the designs and under the superintendence of Messrs. W. SUGDEN & SON, F.R.I.B.A.

THE BRITISH MUSEUM.

ACCORDING to the annual returns, the number of visitors to the Bloomsbury Museum during the past year has slightly declined, being 538,560 as against 558,548 in 1892. This diminution of 20,000 is accounted for by a falling off of upwards of 13,000 day visitors and of upwards of 6,000 evening visitors. The grand total, however, is above the average of the preceding five years.

The reconstruction of the Assyrian basement to serve as a lecture-room as well as an exhibition gallery has been completed in a very satisfactory manner. The fine bas-reliefs from Nineveh are now seen to the best advantage on the line of the light gallery which has been carried round the room; and the floor of the room, which has been cleared of the standard walls on which sculptures were formerly displayed, affords ample accommodation for the audience at lectures.

The rearrangement of the sculptures in the Mausoleum-room has been completed, and the suite of rooms which were formerly known as the Second Northern Gallery have been now occupied by the Cyprian collections, by the Semitic antiquities and by exhibits illustrating various religions, and have been opened to the public.

The artificial lighting of the reading-room has been greatly improved by the installation of incandescent electric lights fitted to the reading-desks. The old system of arc lamps is, however, still retained for the general lighting of the room, but at a lower power.

There has again been a slight reduction in the number of persons using the reading-room in 1893. The number of visits to the room has been 194,122, as against 197,984 in 1892. The average daily number of readers has been 645.

The number of volumes supplied to readers was 1,402,815, as against 1,366,596 in 1892. Thus it will be seen that, although the number of readers has diminished, the number of books demanded by them has increased.

The numbers of students have increased in the Departments of Manuscripts and of Coins and Medals, and slightly in the Department of Prints and Drawings. On the other hand, the number of students in the sculpture galleries has further decreased.

Presentations of Museum publications, including reproductions of prints and drawings by old masters and casts of antique gems, have been made to free public libraries, local museums and art schools throughout the United Kingdom.

With part of the means placed at their disposal by the bequest of the late Miss Emma T. Turner, the trustees, by permission of the High Commissioner of Cyprus, commenced, before the close of the year, excavations on the ancient site of Amathus in that island.

Among the principal donations of the year are the following:—

From the Egyptian Government, a granite shrine inscribed with the name of Ptolemy IX, king of Egypt, B.C. 171-17, in which a hawk, emblematic of the sun-god, was caged; and a series of mummy cases and other sepulchral objects of priests and priestesses of the confraternity of Amen.

From Mr. John Malcolm, of Poltalloch, the Sforza Book of Hours, a most exquisitely illuminated manuscript prepared about the year 1490 for Bona of Savoy, widow of Galeazzo Sforza, Duke of Milan, and afterwards in possession of Charles V.

From Miss Mary Augusta Gordon (by bequest), the journals of her brother, Major-General Charles George Gordon, kept during the siege of Khartoum, 1884, and other documents.

From Mr. John Wingfield Malcolm, C.B., a cartoon-sketch of a picture of the Holy Family by Michel Angelo.

The heirs and executors of the late John Malcolm, of Poltalloch, have deposited with the trustees of the British Museum the celebrated collection of drawings and engravings by old masters formed by him, in order that they may be made available to students. A large selection has been made from them for exhibition in the Department of Prints and Drawings.

The past year has been remarkable, not so much for any one acquisition of extraordinary importance in the Department of Printed Books, as for the great number and variety of interesting additions in almost all branches of literature. The absence of acquisitions on a large scale is partly owing to the unusually small number of important sales by auction, and the consequent want of opportunities for extensive purchases. The chief sales of the year have taken place on the Continent, and have afforded opportunities for enriching the Museum collections with some choice accessions. One of particular interest to English bibliographers, though itself printed abroad, is the letter of Pope Sixtus IV. to the Doge of Venice, February 1483, the fifth of the "*Sex quam elegantissimæ epistolæ*," printed by Caxton in 1483, the only known copy of which was acquired by the Museum in 1890. This is the only letter of the series known to have been printed in Italy, and a comparison of it with Caxton's text renders it probable that he printed from a manuscript. It was purchased at the Borghese sale, with other interesting books. Several important acquisitions were made at the sale of the third portion of the Heredia Library at Paris, particularly the Spanish translation of the travels of Sir John Mandeville, Valencia, 1521, "the year of trouble," as the colophon says, in allusion to the revolt of the commons headed by Padilla; the only perfect copy known. "*Fasciculus Temporum*," B. Segura and A. de Portu, Seville, 1480, said to be the first Spanish book in which Arabic characters were employed. Boccaccio's "*Caida de Principes*," Toledo, 1511; the second edition of the Spanish translation of Boccaccio's "*De Casibus Principum*," with a fine engraving on the title-page representing the Wheel of Fortune. "*Mirabilia Urbis Romæ*," Rome, 1500; the edition specially brought out as a guide book to the city on occasion of the jubilee held in that year.

One purchase in Italian literature is of extraordinary interest. Rarely indeed is it possible to announce the recovery of a book of merit which has been given up for lost. Such, however, is the case in the instance of the "*Essortatione al Timor di Dio*," by the Italian reformer Acontius, engineer to Queen Elizabeth, seen in modern times, if seen at all, only by Chaffepié, the continuator of Bayle, and deplored as hopelessly lost by M. Gaston Bonet-Maury ("*Des origines du christianisme unitaire chez les Anglais*"). The museum has, nevertheless, had the great good fortune to obtain a copy of this tract, interesting on the author's account and its own, and

especially so to Englishmen from being printed in London about 1580 by "Giovanni Wolfio, Servitore de Illustrissimo Signor Filippo Sidnei," and as containing two Italian canzoni and a sonnet addressed to Queen Elizabeth.

The dispersion of the famous Borghese library in Rome has enabled the Museum to add several works of the greatest rarity to its collection of early Italian music. Foremost among these are to be mentioned two very early operas, "La Morte d'Orfeo," 1619, by Stefano Landi, and "La Galatea," 1639, by Loreto Vittori, which, apart from their great historical interest, are exquisite examples of musical typography. Of the latter only three other copies are known to exist, while the example of the former, which the Museum has been fortunate enough to acquire, is believed to be unique. Scarcely less interesting historically, and of equal intrinsic beauty, are two collections of madrigals for three voices, with an accompaniment for lute and harpsichord, edited and published at Rome by Simone Verovio in 1589 and 1595. They are entitled respectively "Ghirlanda di Fioretti Musicali" and "Lodi della Musica," and are printed throughout from engraved copperplates; the former is probably the second musical work produced by this process.

Among the other acquisitions which once formed part of the Borghese Library may be cited a complete set of Marazzi's madrigals, Parma, 1577, of which only one other copy is known to exist; a single part-book of Merula's "Canzoni," Venice, 1615, a work hitherto unknown to bibliographers, and the 1614 edition of Marenzio's sixth book of madrigals, which is believed to be the only complete copy extant.

The Department of Egyptian Antiquities has, among other presents, received a granite shrine inscribed with the name and titles of Ptolemy IX., Physcon, king of Egypt, B.C. 171-17, and of Cleopatra his wife. This shrine was found lying on its side among the ruins of an ancient Coptic church at Philæ, in Upper Egypt, where it had formed the platform upon which stood the altar. In the hollow upper part of the shrine a hawk, the emblem of the sun-god, was caged, or was placed there during great festivals; it was screened from the gaze of the worshippers until a certain moment by doors, the bolt-sockets of which still remain. Strabo, a geographer, records that he saw a hawk in a pining condition in a shrine at Philæ.

Also two coffins of priestesses of Amen-Râ; the spaces left for their names by the artist have not been filled. The coffins were exhumed from a pit at Dêrel-Bahari, on the west bank of the Nile, opposite the site of ancient Thebes, by M. Grébaut, formerly director of the Egyptian Museum at Gizeh, in 1891. In the same place MM. Maspero and Brugsch discovered the mummies of Thothmes III., Seti I., Rameses II. and of several other kings in 1881; and it seems that they and the mummies of the priests and priestesses of Amen-Râ were removed there hastily when, owing to loss of influence and power, the confraternity of Amen was compelled to take refuge in Nubia in the ninth century before Christ. It is not possible to fix an exact date for the establishment of the brotherhood of the priests of Amen, but it is certain that they gained power during the reign of Amenophis I., B.C. 1666, and that for about six hundred years this power increased until they made themselves sacerdotally and politically the strongest influence in Egypt. The high priests of Amen became eventually kings of Thebes, but they soon found their position untenable, and the funeral furniture of the members of the brotherhood is all that now remains to mark their rule. The archæological importance of the coffins of the priests of Amen is very great, and this group helps to fill a gap in the national collection.

The arrangement of the Mausoleum-room has been nearly completed, one of the columns with its entablature and part of the coffered ceiling having been erected, three of the lions moved and remounted and two marble pedestals prepared for the colossal horses of the quadriga; the sculptures and architectural members from Priênè have been rearranged and remounted; the capital of one of the antæ of the temple restored and mounted; the sculptures in the Græco-Roman basement have been rearranged and the plinths and pedestals repaired; certain of the sculptures in the Ephesus-room have been moved; six new marble pedestals have been prepared for sculptures and a marble head repaired and mounted; plinths and fittings have been prepared for the room of Greek and Latin inscriptions and the cast of the Lycian inscribed monument re-erected in the old Inscription-room; one stele, two sepulchral tablets and fourteen inscriptions have been mounted on stone plinths; a terra-cotta cornice from Civita Lavinia has been restored and mounted on slate; the wall-cases on either side of the Medal-room door in the Etruscan saloon have been fitted up, and cases 26-31 prepared for terra-cotta antiquities from Cervetri and Civita Lavinia; three terra-cotta panels repaired and mounted, four oak and seven pine pedestals and a stand for drawings of the Priênè temple have been prepared, two drawings of the Mausoleum mounted and framed. The most important acquisition in the section of Early British and Prehistoric Antiquities is the gift by the Rev. William Greenwell, D.C.L.,

F.R.S., of a further series of objects excavated by him in British barrows, and described in "Archæologia," vol. lii. These are the contents of nine barrows at Willerby and Folkton, East Riding of Yorkshire; they include three very curious objects in chalk, the purpose of which is unknown. They are richly ornamented, and unlike any barrow remains hitherto discovered.

An electrum stater from Phocæa in Ionia, one of the most singularly interesting numismatic monuments which have survived from the earliest period of the art of coining, has been among the additions to the coins. It belongs to the first half of the sixth century B.C., during which time Phocæa, one of the chief centres of maritime enterprise in the Mediterranean, was supreme upon the sea (Herod. i. 163). According to Eusebius ("Chron." ed. Mai, p. 331), the Phocæan Thalassocracy lasted 44 years, commencing circ. B.C. 575. It has, however, been shown by Goodwin ("De potentiæ veterum gentium maritimæ epochis apud Eusebium," Göttingen, 1855) that the beginning of the Phocæan Thalassocracy must be placed as early as B.C. 602. From this time until the reign of Cræsus, king of Lydia (B.C. 560), the commercial influence of Phocæa, both on sea and land, was predominant, and strong enough to give occasion to an entire reform of the currency of the Ionian coast lands. The newly acquired stater, weighing one-fiftieth part of the old Babylonian gold mina, is a specimen of this reformed coinage. Artistically it is also of great interest, as it is the oldest known example of what is called a "type parlant" (i.e. a device suggested by the name of the town). On the obverse is a seal (φώκη), the badge of Phocæa, and on the reverse two rude incuse squares of different sizes. This stater is also of considerable palæographic importance, for it bears an ancient form of the letter Φ (⊙) which has not been met with elsewhere, either on coins or inscriptions. There are few coins of remote antiquity which have been so frequently cited, both by Greek historians and metrologists, as this famous electrum stater of Phocæa, of which the only other extant specimen is preserved in the museum at Munich.

THE TELL-EL-AMARNA TABLETS.

THE following excellent account of the tablets discovered at Tell-el-Amarna has been communicated to the *Irish Times* by Mr. L. E. Steele:—The startling rapidity with which discovery after discovery is being made amidst the relics of the dead past, leaves the ordinary non-expert reader very much puzzled to know where exactly ancient history now stands. It would seem that with all that has been found in Egypt we are only scraping the surface as yet; fresh history is pouring in upon us from the East in astounding volume; the land of Greece is being probed for her treasures more deeply than heretofore; Syria, with its entombed past, is muttering its secrets about Phœnician and Hittite; whole nations, of whose existence a few years ago there was not even a suspicion, have in startling detail suddenly taken their place on the pages of history. Numerous explorers, German, French and English, are at present at work in remote districts of Western Asia, the result of whose labours will not be known, perhaps, for many years to come; and, as scientific exploration is really but the birth of yesterday, we may expect that the activity now being displayed will in a few years completely revolutionise that subject which with our grandfathers was a favourite study, and which they were pleased to call "Universal History." But all these marvellous discoveries have yet to be weighed and compared, and their proper perspective determined, and until that is done by some masterhand we must be content to learn what we can of the truth and value of these separate "finds" to which archæologists are monthly calling attention. We propose in this article to popularise the results of a discovery in Egypt, which, although it was made so far back as 1888, we are only now in a position fully to appreciate, and we cannot understand its value unless we rub up our knowledge of a few facts in Egyptian dynastic history.

If the ordinary reader were asked to name at random two kings of ancient Egypt no two would occur more readily to his memory than Thothmes III. and Rameses II., and this undoubtedly from the fact that the first has been familiarised as the constructor of that elegant obelisk which stands upon the Victoria Embankment, and the second as the usually accepted "Pharaoh of the Exodus." Most useful as landmarks in Egyptian history they are to remember, for they are two typical monarchs of two of the most powerful dynasties that ever ruled in the Nile Valley, namely, the eighteenth and nineteenth. Both were great and successful conquerors and both have left behind them evidence in abundance of the superb artistic skill which their age possessed and which they fostered and encouraged.

The discoveries in 1886 of the mummies of several monarchs of the nineteenth dynasty excited most unwonted popular interest in the progress of Egyptology—a discovery which in itself, relatively speaking, of little historic value, nevertheless

served this useful purpose, that one is hardly deemed educated if not fairly familiar with the history of the chief kings of this great Theban dynasty. More recent "finds" have, however, diverted public attention from the nineteenth to the eighteenth dynasty; and to the period of this latter dynasty has been assigned the discovery which gives the title to this paper.

The eighteenth dynasty comprised eleven kings, whose reigns extended, in round numbers, from 1700 to 1400 B.C. They reigned at "hundred-gated-Thebes," where temple and obelisk tell the story of their power and lavish expenditure. The first of the dynasty was one Ahmes, whose Egyptian name the Greeks transformed into Amosis, and who distinguished himself in a most notable way; for he it was who freed Egypt from the tyranny of that strange race of foreigners known as the Shepherds, who had ruled the land for many hundred years. The event was a counterpart in antiquity to the release of Spain from Moorish domination by Ferdinand in the fifteenth century of the Christian era. Having tasted the sweets of success, Ahmes pushed with his army into the south part of Palestine, crossing that little Wady El Arish which divides north-eastern Egypt off from Syria, and succeeded in establishing a firm foothold in Syria. His successors, improving upon his triumph, had the whole of Syria practically at their feet; the many petty kings of the Canaanites acknowledging the Egyptian kings as their suzerains, just as the present Sultan of Turkey claims suzerainty from the ruler of modern Egypt.

Now, it is of the utmost importance to bear these facts in mind, and also to remember that these events occurred between 200 or 300 years before the Exodus of the Hebrews from Egypt into this very land of Syria. The towns which in late years became so familiar to us—Ascalon, Joppa, Tyre, Sidon and Beyrut—were taken by Ahmes and his successors, and they pressed on even so far as to Kadesh, a town on the Orontes, and still further to Carchemish, a stronghold on the Euphrates.

But as years rolled on these subject tribes of Syria became discontented, and rose, like the Poles in later times, against their exacting masters, until, in the reign of Thothmes III., of the Thames Embankment fame, a great rebellion took place, which, however, was successfully crushed by that great sovereign. On the walls of that temple at Karnak, the most beautiful the world ever saw, Thothmes has recorded the incidents of his campaign, entering with minute detail into the number and names of the cities which he captured, and the amount and nature of the spoil which he carried back to his country, all incontestable evidence of the advanced art and civilisation of the people who occupied Syria before the Hebrews came to trouble and dispossess them.

It would be a serious error to suppose that all this expenditure of energy and money was simply made in the spirit of a Cambyses or a Tamerlane. Thothmes had far higher motives than the mere love of conquest to urge him on to undertake this campaign. It was all-important that Egypt should hold Syria, for she had established a great trade with the lands which lay along the Euphrates, and the road which bore her traffic, a road no less than 600 miles long, ran from Zoan, the most eastern stronghold in Egypt, right northwards through Palestine, Northern Syria, to Babylonia. Vast commercial interests were at stake, and Thothmes well knew their value.

Now it is upon this period of Egyptian history, and the relations of the Egyptian monarchs with Syria, that this discovery has thrown such an extraordinary and unexpected flood of light, and equipped with these few historical facts, we are now in a fair position to grasp its significance.

There is a little Arab village, near the Nile bank, about 150 miles south of Cairo, and midway between Memphis and Thebes, known by the Arab name of Tell-el-Amarna. In 1888 an Arab peasant woman, grubbing amongst the ruins of the ancient city of Khuenaten, which are not far from this village, suddenly came upon a number of little clay tablets covered with inscriptions. She unearthed no less than 320. The authorities at once pounced upon them and distributed them amongst the chief museums of Europe, and although the majority have gone to Berlin, the British Museum has fortunately secured eighty-two of the precious tablets. Full translations and accurate descriptions have now been published, and these invaluable documents of a remote age are now known as the "Tablets of Tell-el-Amarna." They vary very considerably in dimensions, some of them being almost 9 inches long and 5 inches broad; some only 2½ inches in length and less than 2 inches in width. They are in many cases in colour and shape not unlike Spratt's dog biscuits. We are familiar with the form of the cylinders which formed the library of the Assyrian king, Assurbanipal, discovered years ago at Kouyanjik, but the forms of these little tablets are quite different: some are rectangular and some are oval; some are made of a yellow, some of a red clay, and some are made of Nile mud; and, as will be readily seen, the material used is an indication of the region of their origin.

They are closely covered with that peculiar and very early form of writing which appears to have prevailed in Western

Asia before an alphabet was evolved, namely, the cuneiform or "arrow-headed" writing, but of so novel a variety that in many cases the translators, skilled as they were in the Assyrian mode, have found much difficulty in interpreting it.

These little clay tablets are no less than so many letters, and the whole collection represents a corpus of official correspondence dating from the fifteenth century B.C., carried on between three Egyptian kings of the eighteenth dynasty and sovereigns of Babylon, Assyria, Armenia, Asia Minor and the Egyptian deputy-rulers of towns in Palestine.

The bulk of the correspondence is very considerable, and is said to amount in quantity to about half the Pentateuch.

Let us realise the unique interest attached to this collection of letters. In the first place they are the identical documents penned by hands who have now lain in the silent tomb no less than 3,400 years; they are originals, not copies. There they are with their words, erasures and corrections as the old world scribe left them, clear and clean cut; so much so that distinction in handwriting is detectable, one correspondent having employed four or five scribes in the course of seven years. Then, again, they launch us back into time to a period antecedent to the Exodus, and reveal to us an unexpected civilisation in Palestine, and in countries north of Syria as existing before that event. We are actually introduced by them to the Canaanite at home. They tell us of the political relationship in which the mighty Egyptian monarchs stood to the kings or governors of Western Asia. They give us novel information as to the offensive and defensive treaties made with peoples who are only now beginning to take shape as they rise out of the gloom of the past. They speak of marriage alliances, of religious ceremonies and of intrigues; they enable Biblical scholars to identify many towns named in the Scriptures, and Egyptologists many towns named on the great list at Karnak, and finally the dialect in which they are written supplies a number of new words and constructions which were heretofore quite unknown to linguistic scholars.

Having acquired some knowledge of these extraordinary records, let us now make acquaintance with the general contents of these letters. They may be roughly grouped under two heads (a) letters from foreign sovereigns, and (b) letters from Egyptian governors of subject towns in Palestine. The letter which chronologically would appear to be the first of the series seems to have been written to Thothmes IV., not later than 1520 B.C., by one Rimmon Nerari, who makes an earnest appeal to his Egyptian sovereign and master to send him soldiers to fight the Hittites, those curious pig-tailed, slant-eyed people of Mongolian race, who were then troubling North Syria. Thothmes IV. was succeeded by his son Amenophis III., who is popularly known as Memnon and as the erector of those two superb well-known statues, the Colossi of Thebes. He made a most important foreign marriage alliance, one which indirectly brought in subsequent years disastrous results to his dynasty. He married a lady called Thi, a princess, and daughter of a king of Mitani or Mesopotamia, whose tomb was found at Thebes and from which two stibium tubes now in the British Museum were taken; the longest letter in the collection is from Dusratta, her brother. The letter now lies under a glass case in the British Museum. It has no less than 518 lines of minute cuneiform inscription, and the subject matter of the letter deals with an offer of marriage which another Egyptian sovereign, Amenophis IV., the last king of the eighteenth dynasty, had tendered to Tadukhepa, the daughter of this Dusratta, a marriage which eventually took place.

But these kings also sought marriage alliances with the royal family of Babylon, and one of the most entertaining group of the series is that which recounts the chaffering and haggling, dignified, however, as far as language is concerned, about their daughters.

One of the letters (No. 1, British Museum) is a duplicate of a letter addressed by Amenophis III. to a king of Babylonia, Kalimmasin by name, who here appears for the first time in history. The Egyptian sovereign has asked for one of his daughters in marriage, and Kalimmasin objects to send his daughter so far, and, moreover, states that his sister has been married to a former Egyptian sovereign, and had never been seen or heard of since by her own people; urges other excuses—that it was a Babylonian custom that the daughters of the royal house should marry at home, and that even if he did agree to send her he had no guards and chariots to conduct her so far in safety. But Amenophis is equal to the occasion, and replies to all his objections; says that Kalimmasin's sister is alive and well, offers presents, and to defray the expenses of the journey, and is so accommodating that he leaves it to the Babylonian king to decide which daughter he shall send. Poor Kalimmasin, encouraged by these overtures from his brother-sovereign, ventures to suggest that the compliment might be returned by the gift of an Egyptian princess for his harem. He receives a sad snub. The letter of reply to this audacious request has been translated in all its ruthless insolence. It is probably the earliest instance on record of pure and unadulterated snobbery.

It would delight the heart of a Thackeray. The letter closes with the cool remark that "the daughter of the king of the land of Egypt hath never been given to a nobody."

The series of letters addressed by various Egyptian governors of towns in Palestine to Amenophis IV., the last king of the great eighteenth dynasty, best known as King Khuenaten, is intensely interesting. A great drama is being enacted. The Hittites and the Amorites—called Amurri on the tablets—are swarming into Palestine and town after town goes down before their impetuous rush. Letters from governors of Byblos, Beyrut, Tyre, Sidon, Ascalon, and finally from Gezer, a town close to the confines of Egypt, show the gradual but sure success of the enemy as they make a clean sweep of the Egyptian garrisons. From history we know how the land of Egypt was just at this period rent by domestic dissensions. The king, who was an eminent reformer of the art and religion of his country, had excited jealousies and enmities at home by his novel departures, and had his hands pretty full. He was quite unable to send troops to the assistance of his faithful governors. There are no less than fifty letters from a man, Rib-Adda, who was governor of Byblos, a town referred to in the Psalms as Gebal—"Gebal and Ammon and Amalek; the Philistines, with the inhabitants of Tyre." There is something wonderfully realistic in the earnest appeals which Rib-Adda makes to his sovereign as he describes how the enemies press on. For five years he holds out. His last few letters are full of despair, and the sudden cessation of the correspondence tells the tale which our imagination easily completes; the tragedy of Byblos closes on a darkened stage.

But perhaps the most interesting of all the letters, from the popular point of view, are six epistles written from Jerusalem (Urusalim on the tablets). They are amongst the very few which are addressed to Egyptian sovereigns from towns in Southern Palestine, and are priceless in their suggestiveness. The importance of these six letters lies in the fact that for the first time in a profane history a possible reference occurs to the coming of the Hebrews into Canaan after their wanderings in the desert; but if this be the case our preconceived notions of the period at which they entered the Promised Land will be entirely revolutionised. In an early part of this article we drew attention to the fact that the events referred to in these tablets must have occurred some 200 years before the Exodus. This statement was based on the supposition that Rameses II. and Menephtah, kings of the nineteenth dynasty, are respectively the Pharaoh of the Oppression and of the Exodus. It may as well be frankly confessed that this supposition rests on a very insecure basis, and if these six letters really contain a report of the invasion of the Hebrews, we must be prepared to throw the Exodus back over 200 years earlier than the time of these two monarchs.

What then do the tablets tell us? We have seen from the other tablets that the enemies of Egypt in the North of Palestine were the Hittites and Amorites, but the governor of Jerusalem has to deal with quite another foe. He earnestly appeals for aid against the people of the "Abiri," who, we are informed, have rebelled "as far as the land of Seir." We learn that they conquered and devastated the neighbourhood of Gezer and Ascalon and Lachish, and took the towns; that they fought a battle at Ajalon, and that they forced the town of Keilah to submit; that they attacked the King of Jerusalem, and finally, as proof that they were hostile to the religion of the inhabitants, they appear to have destroyed the idolatrous temples of the Amorites. Now, the important points to note in connection with this record are—first, that scholars admit that there is no objection, as far as language and its history go, in accepting this word "Abiri" as equivalent to Hebrews; second, that this reference to Seir is quite in accordance with the Scripture statement as to the point at which the people of the Hebrews entered the land; and third, this hostility to the religion of the country points to the fact these "Abiri" were entirely out of sympathy with the natives of Palestine. These are strange coincidences, if nothing more; but there is a fairly reasonable probability that we may claim this reference in these marvellous tablets as independent evidence, if we needed it, of the record of Holy Scripture as to the invasion of Palestine by the chosen people.

We have dealt very superficially with the wealth of literature supplied by these extraordinary tablets, but we have said enough to show that this correspondence of the Foreign Office of Egyptian sovereigns who ruled 3,400 years ago is full of vivid interest to us, though separated from them by so vast a space of time.

While we write, news of two great discoveries reaches us from Egypt. Mr. de Morgan, who has been exploring in the neighbourhood of the Pyramids of Dashour, not far from Cairo, reports the discovery of two boxes full of the jewels of kings and princesses of the twelfth dynasty, and the indefatigable Professor Petrie has just returned from his investigations at Koptos, an ancient city-site near Thebes, where he claims to have unearthed some statues of prehistoric Egyptian times which, he states, brings us another step towards the solution of that ethnographical puzzle as to the original home of the ancient Egyptians.

SPECIFICATION WRITING.*

I HAVE been asked by Professor Laird to talk to you on a subject connected with the practical side of my profession.

Now I do not know anything more practical than the matter of the preparation of building specifications, and if you will bear with me for a little while in discussing this uninteresting, but quite important, question, I will try to tell you something about them based upon my own experience.

In reality, an architect commences to write his specifications when he commences his drawings—one involves the other. The knowledge requisite for the one is as necessary for the other, and as the lines are drawn the specifications form themselves. The insight into construction necessary to draw correctly indicates the ability to describe the work shown on the drawings. Without this ability the drawings and specifications alike will be failures.

There is no one thing in our profession that has as much to do with personal success in its practice as the ability to properly prepare specifications. And I do not in stating my idea as to relative importance except the question of design; because to one person able to discriminate at all between good and bad design, there are a great many who very clearly distinguish between good and bad business ability, and who will not fail to express their opinion of the architect who does not properly protect them, who, for instance, forgets to specify the stripping of walls, or the traps on plumbing fixtures, or the rain conductors. And the fact that the exterior of his house is an architectural "dream," or that the detail of his mantels and stairway is "out of sight," will, in a certain sense, be only an aggravation of the offence—a sort of adding insult to injury which he will not forget. And your chance of making a living at your profession, not to speak of a fortune, which is hardly possible—at least I have never heard of an architect dying rich—depends upon the reputation you make as a careful practitioner.

To carefully write your specifications is indispensable to successful and conscientious supervision of the work; it is impossible where they are drawn loosely or in a slovenly manner, and it is not worth while to handicap yourself in this way and add unnecessarily to the inevitable load of responsibility and worry which will come legitimately with the practice of your profession. It does not do for building; they are apparent for all time, and, like the fly in the pot of ointment, spoil the whole. Mistakes are two-edged swords. They destroy your client's confidence and your own, the latter perhaps more disastrous to you than the first. Of course all this philosophising applies also to the drawings, but if you prepare your specifications with care and minuteness you will escape most of the pitfalls, and they will greatly help you to accuracy in the drawings.

The specifications bear somewhat the relation to the drawings that the arteries and veins do to the body, and they should, like them, extend from the foot to the head, from the footings to the cresting of the roof, and ramify in all directions, covering each little point of construction and material. They cannot be too full. Nobody ever got into trouble because he too minutely described the work to be done or the materials to be used.

To draw good specifications requires exact knowledge. You must know precisely what you want and how you want it done. Your directions must be specific, as the name implies, and clear and simple in expression. Make your paths straight, so that the wayfaring man, though a fool, shall not err therein, but make them narrow as well, so that he shall not have room to wobble. It does not follow necessarily that he will be a fool, though it has sometimes seemed to me that nothing short of idiocy could explain what seems to be an irresistible impulse that forces the average workman to do things exactly the wrong way when the reverse is really easier.

It does not do to specify things generally or to assume that "Oh, they will understand that." Believe me that they will not; if there is any possibility of a misunderstanding it will be embraced. Do not leave your phrases until they are clear beyond any possibility of ambiguity, remembering always that it is too late to change the specifications after the contract is signed, and that it may be exceedingly inconvenient to have to explain clauses which are capable of more than one reasonable construction.

It is a great help to use the trade terms, names and grades. The builders understand them, and it will enable you to ascertain more readily whether you are really getting what you specify, and where it is practicable I would specify materials which have their quality marked on them. But unless you have some reason for requiring a particular make, it is better to specify two or three makes equally good rather than the make of any one manufacturer. I know no class of men more disinterestedly honest than architects, or who so little let questions

* A lecture delivered before the Architectural Department of the University of Pennsylvania by Mr. T. Roney Williamson, architect, and published in the *American Architect and Builder*.

of money or profit have any bearing on their professional conduct. But it is possible that a misconstruction may be put upon a perfectly innocent act, and the requiring of the product of a particular manufacturer may give rise to question, particularly if there are other goods of the same grade and general worth in the market, and it is well to avoid even the appearance of evil. In addition to this reason, which I express with some hesitation, and which I am very well aware may be open to the charge of timidity, there is this other, that to close out the goods of all manufacturers but one destroys the chance of competition. That these remarks are perhaps rather less practical than ethical is true, but they have something to do, nevertheless, with what has been my practice in preparing specifications.

The sin peculiar to the specification is the sin of omission, and the greatest particularity will hardly insure against it. I use as a sort of safeguard a scheduled synopsis and use it always, which I will show you and explain further on and which I have found of the greatest use, but which must be added to continually as the complexity of work and the increase in the number of appliances and methods become greater with the passing of each year.

In making drawings it is my custom and that of other men as well, I have no doubt, to print upon them many notes as to things not of a nature to be clearly shown by the drawings, placing the notes on the parts to be explained, noting girders, beams and their sizes, sizes of flues and their linings, if any, finish of rooms, kind of flooring, kind of glass and many other matters of that kind. They are really part of the specifications and should be specified in them also, or at least attention called to the fact that such notes are to be taken as part of the specification in the general clauses of the specification to which I will refer later on. One advantage in placing these notes is, first, that as they are made at the time the drawing is made, they are fixed there once for all and are not liable to be forgotten, as they may be if you wait until you write the specifications; and secondly, that they are right before the builder's nose when he looks at the drawings and he is not likely to miss them.

A not very usual thing, but a very convenient addition to a specification is a table of contents, giving the page-number and a list of the subjects on the page. It saves a good deal of time in the use of the specification and is very little trouble. And somehow, as there is never enough time and always too much trouble going, any labour and time-saving devices are of value.

The working or detail drawings, in contradistinction to the contract drawings, *i.e.* the plans and elevations, are the final exponents of the contract drawings. These drawings are made up from the contract drawings and the specifications, from which last the methods of construction, size and kinds of materials must be derived. They embody both, and if it were possible to make the working drawings with the contract drawings before estimates are made, the specifications might be shorter, which would be desirable; and as it is impossible to make in many cases the word written as readily understandable as the word drawn, there might be less misunderstanding, which would be still more desirable. In this connection let me say that exact and minute specifications and full working drawings will enable you to build cheaply, an important thing to your client, who, if he be like most of us, is generally scheming to get a dollar's worth for ninety cents, because the bidders will not have to allow so much for "laps and slams," for the things not clearly shown or definitely specified, but which look the larger and more dangerous because they are undefined. As a general thing, when great differences in the amounts of bids occur, you may make up your mind that there is some want of clearness or of particularity in the specifications of drawings. The exception to this rule is caused by the irresponsible bidder who throws his hat at the drawings and guesses how much the work is worth, and who is either very high or very low; but in fact he should not have a chance to bid, as generally his hope triumphs over his experience, and he bids low and sometimes gets the building, to the ultimate scamping of the work, his own loss and also the owner's, and to the despair of the architect. It is this sort of bidder who grizzles the locks of the superintendent, and eventually brings his gray hairs in sorrow to the grave. Avoid him, if possible, and care and firmness will generally enable you to dodge him, but you must avoid him before he bids; afterwards it may be too late, for your client having the easy idea that the architect is paid to watch the builder anyhow, is apt to turn a deaf ear to your suggestion that he take a higher bidder at an ostensible loss of the difference, expecting you to play stop thief, a sort of "I spy" game with the contractor, with the usual result of making for yourself, at the least, two enemies—the owner and the contractor—and of having been unable to entirely protect the owner or curb the contractor.

There are some things you will require to specify which are difficult, almost impossible, to describe, so that their value can be got at—stained or leaded-glass, for example, or an elaborate

stairway or carving, and matters of that sort. My method in such cases is to put a price on them, for glass by the foot, unless I intend very elaborate work, in which case I omit it and say so. If for a stairway, I name a lump sum, and specify whether that includes the nosing or not and the finishing. For carving, I specify a sum of money to be allowed, or if very costly, like figure-work, omit it and say so. When a sum of money is allowed, you should state that the owner is to buy where he pleases, otherwise you may find some trouble in putting the work where it will be best done.

Forms of specifications vary somewhat, but in essentials they are alike. I presume you are familiar with their general make-up; in fact, it has been a matter of some debate with me how much of this talk is threshing of old straw and an old story to you. However, I have concluded that it won't hurt you to hear again what you have already learned, and I may have said something that will help to impress upon you the instruction probably received before.

The specifications begin with the recital of the general clauses. The general clauses are those which are to be observed and followed by all the trades connected with the work of the building, which call attention to requirements common to all and are binding upon all.

The first of these refers to the architect and his authority, whether he is to supervise the work or not. If so, the clause is worded thus, "The work to be erected under his supervision and to his approval without reference to any other person." The sentence "without reference to any other person" is an interpolation of my own, but it is a good one, as it makes you the dictator as it were, the sole arbiter of the drawings and specifications, and while it seems to add responsibility, really lessens it, or at least simplifies it and will rid you of a good deal of foolish and annoying interference from both contractor and owner. It is occasionally objected to, sometimes by the contractor, but not often, the contractor knowing from experience the safety that lies in a court of last resort; more often by the owner, but I think it well to insist on it. It defines the authority of the architect positively and rids him of the annoyance of having his decisions overruled. This does not refer to any question of values necessarily (the agreement usually providing that dispute as to prices, &c., shall be decided in some other way, as by arbitration), but to matters connected with the design and the meaning and intent of the drawings and specifications, where the architect is the only person who is qualified to decide after all.

The second clause refers to the unity of the drawings and specifications, calling attention to the notes written upon the drawings as being part of the specifications and that drawings and specifications are to be taken together and not separately. Work shown or mentioned in either to be taken as if in both. This clause is intended to insure against omissions in either of the two and is a valuable one. The utmost care may fail to include in both what may be in one or the other.

The next provision is one requiring the contractor to follow the detail drawings as the final exponents of the contract drawings, with the implied guarantee on your part that they shall show no new work or work not suggested by the contract drawings, but which insures you an opportunity to correct or improve on your design up to the last moment within the bounds of the rights of the contractor.

Next, a claim of importance requires the builder to follow the figures on the drawings rather than to measure them with scale. Builders will use the two-foot rule if they are permitted, with unfortunate results, particularly where you have worked things down in your planning to a very fine point. This same rule, generally the worse for wear, is not a safe instrument to use, particularly if your drawing is one ninety-sixth or one forty-eighth the full size, while the figured drawings, if properly checked, can be made exact without any possibility of doubt.

The last clause of the general clauses is one requiring the contractor and all trades to comply with all city ordinances and requirements; to pay for all permits, and to hold the owner free from all penalties for infringement of ordinance, or failure to comply with the same.

Some copies of specifications I have seen have more than these clauses; but I think that these embody all that apply directly to the work of the building, any other requirements belonging more particularly to the agreement.

The methodical arrangement of specifications should be this:—Excavation, stone-mason and cut-stone, marble, brick-layer, terra-cotta, mosaic floors, tiling, cement pavements, carpenter, mill-work, plumber, tinner, plasterer, galvanised iron, roofer, iron-worker, beams, &c., painter and glazier, heater, steam-work, engines, electric-work, dynamos, &c., lifts. Each trade should be complete in itself, and the specification should embody all of the work and materials required, and any work or materials to be done or supplied in connection with any other trade, as for instance, the tinner sometimes supplies registers, to sizes given by the heater contractor, which are set by the plasterer. You see these three trades require each notice that the others have to do with them. It is necessary,

also, that if for any reason you vary the work usually done by any one trade, you shall give notice to it, that either it shall include work not generally taken or exclude work usually taken, as for instance, the painter I always require to furnish the glass. In some localities the millman furnishes the glass for the general trade. If you wish to avoid any trouble, you must always say in the mill-work specification that he shall not furnish the glass, or omit it from the painter, and let the millman furnish it. You can require the plumber, if you choose, to put enamel paint on a tub or on a wall of a bath-room, or to supply casings of wood or marble for his fixtures. And the reason you do this is to avoid interference of one trade with another, and to make the plumber entirely responsible for his own work, so that he cannot plead for any breakage or spoiling of work that the carpenter, mill-man, or painter, or marble-worker, did it. Now when you have done this, you must notify the painter, mill-man, carpenter, the marble-worker, that the plumber does this work, otherwise you may pay twice for it; that is, both trades may estimate on it, seeing it required on the drawings and clause No. 2 of the general clauses before them, which would be unfair to your client, of course.

Builders sometimes object to the grouping of work in this way, and unless the trade whose usual business it is to provide the work or material is notified in his specification, it may make confusion. Notification is sufficient, however. And thus while you make the plumber provide all marble-work required, you have let the marble mason know that, and also to know where the specifications for that marble-work will be found, by your intimation in his specification. Always draw each specification so that, if the work is let separately, each man's work is in his specification complete, with nothing left for implication one way or the other.

With a general contractor as the builder (one man who assumes all the work) he is, of course, responsible to you and to the owner, and work or material specified anywhere in the specifications would be held, from a legal point of view, to be his to do or furnish. But if your specifications are defective as to who of all those who contribute toward the work does each part, you can put your general contractor in a hole very easily, and he has a moral right to expect that when he gets his estimate from mason, plumber, or any one else, that they have taken all that is required, and that there is no such ambiguity as will cause him to lose money instead of making his legitimate profit, and in which latter case he is likely to make your existence an unpleasant one as far as your connection with that building is concerned.

Your specifications must agree with the drawings. There must, of course, be no conflict between them. Each building is *sui generis*. There can be no general specifications prepared which will meet every case. There are forms of specifications printed which proceed upon the idea that you shall cross out any clauses not applicable to the house for which they are intended to be used, leaving in those which are; but you are very likely if you use them to leave in parts which have no business to remain, and you will have specified cornices where outlookers are shown; turned posts where squares are drawn; stone heads where arches are shown, and a thousand other inaccuracies, small, perhaps, but all requiring explanation, and lessening your control of the work; in addition to this, crossing out, or interpolating, gives rise to question sometimes, and it may be hard to prove, from such specifications, their correctness.

(To be continued.)

VANDALISM IN THE SEVENTEENTH CENTURY.

THE new volume of the Historical Manuscripts Commission relates to those owned by the Duke of Portland and preserved at Welbeck Abbey, belonging almost exclusively to the history of the Harley family in the seventeenth century. We have the correspondence during that period of Robert Harley, Earl of Oxford, whilst he was still young and unimportant, and also of his immediate forbears, namely, his great-grandfather, Thomas Harley, his grandfather, Sir Robert Harley, and his father, Sir Edward Harley, all of Brampton Bryan, in Herefordshire, in which county they had been established for many generations. They were connected by ties of blood and marriage with several of the leading families of the neighbourhood, and consequently occupied a position of some importance in the affairs and interests of the county. Of Thomas Harley, the great-grandfather, we know little save that he seems to have been a useful country gentleman, but of Sir Robert, his son, we know more, as a large number of his letters are preserved. He did not confine himself to Herefordshire, but went out into the great world, made friends, and corresponded, amongst others, with Dr. Donne, Sir Edward—afterwards Lord—Herbert of Cherbury, and George Herbert, the poet, who sends him an interesting letter upon current events, written

from Charing Cross on December 26, 1618, by request of Sir John Danvers. A marriage was proposed between Sir Robert Harley and Ann Coningsby, daughter of Sir Thomas Coningsby, of Hampton Court, also in Herefordshire, but the negotiation was broken off on the vexed question of money, and he ended by marrying three times, his last and most distinguished wife being Brilliana Conway, who received her unusual name or Brilliana from the fact that her father, Sir Edward—afterwards Viscount—Conway was governor of the Brill at the time of her birth.

The story of the defence of Brampton Castle by Brilliana, Lady Harley, against the king's forces in 1643 is too well known to the students of the history of that period to require more than a passing notice, but there are many gaps in the correspondence of the Lady Brilliana Harley—as she is sometimes incorrectly called—which was published some years ago by the Camden Society, which are here supplied. The castle was twice besieged—once in her lifetime in 1643 and once after her death. She herself successfully repelled the first attack, which began in March and lasted on into August. But she succumbed shortly afterwards to the anxiety and strain of mind and body which she had endured. One of her attendants, Samuel Moore, writes to a servant of Sir Robert Harley to tell him the sad news that “this Sabbath day the sweet lady's soul went to keep eternal Sabbath in heaven, where she can never be besieged.” When the second siege took place the assailants were more successful, and the whole garrison, including three of Sir Robert's children, were taken prisoners and sent to Ludlow Castle. They were set at liberty in May 1644 and allowed to rejoin their father in London.

Sir Robert Harley was a rigid Puritan, with all the Puritan's horror of graven images, and we find him, after the first part of the civil war was over, entrusted with the congenial task of superintending the planing off of the “idolatrous” pictures in Westminster Abbey and other churches and chapels, removing the stained-glass from the windows, taking down “the statues of the Virgin Mary and other saints,” melting down the church plate, and destroying the precious vestments which still remained in the sacristy presses. One item which we may mention details the burning of the embroidery called “The Glory,” belonging to the high altar of Canterbury Cathedral. The list of receipts for iconoclastic work done under his direction in the years 1644 and 1645 gives a matter-of-fact but none the less vivid account of destruction which nowadays would shock the least artistic amongst us, and makes us feel that the hand of the reformer in the reign of Henry VIII. was less harmful than the furious zeal of the Puritans under the Commonwealth. To show the feeling with which pictures and images were generally regarded at that time, we may quote a curious letter from Brilliana Harley (the daughter), written to her brother Edward on January 14, 1639. She writes:—“My father had lately brought him a most horrible picture of the Great God of Heaven and Earth, which he broke all to pieces;” and again, a few days later she writes:—“My father sent for it (the picture) and broke it in pieces, and I flung the dust on the water.” Before long, however, Sir Robert became so completely out of sympathy with those at the head of affairs that he was obliged to give up public life, and we find him living in London for some years in great retirement and probably poverty, and viewed, moreover, with great suspicion by his former colleagues. He removed to Ludlow about 1652, having been refused a resting-place at Shrewsbury, and died there in 1656 without ever returning to Brampton, which had been burned at the time of the last siege.

EXHIBITION OF MARINE PAINTINGS.

THE museum and art gallery committee of the Birmingham Corporation having decided to hold an exhibition of works by living English marine-painters, Mr. Whitworth Wallis has been busily engaged for some months past in getting together a representative collection, which, to the inhabitants of an inland town, says the *Birmingham Post*, should be particularly interesting and attractive, and which will be found to be a worthy successor of the Burne-Jones, Watts, David Cox and other exhibitions held in former years. Under the special circumstances Her Majesty the Queen has been graciously pleased to lend, from Windsor Castle, the picture of the Jubilee Review, by Sir Oswald Brierley; and the Duke of Saxe-Coburg-Gotha also contributes three works by the same artist. The Prince of Wales has again testified to the interest he takes in the Birmingham Museum by contributing from Sandringham two pictures, by Mr. W. L. Wyllie, R.A., of His Royal Highness's yacht “Britannia.” Mr. Henry Moore, R.A., will be represented by no less than eighteen works in oil and water-colours, including “Sunset after Storm,” “Storm Coming On,” “A Pilot Cutter,” “Mussel Gatherers,” “Summer at Sea,” “Snowstorm Clearing Off,” “Clear Weather after a Gale,” “Off the Start,” “The Sound of Isla,” “Westward,” &c.; Mr.

J. C. Hook, R.A., by his celebrated "Luff, boy," "Between the Tides," "The Day for the Lighthouse," "Low Tide Gleanings," and "Wreckage from the Fruiter"; Mr. John Brett, R.A., by the famous "Britannia's Realm," lent by the trustees of the Chantrey Bequest, "The Gray of the Morning," "The Sicilian Sea," "Cornish Lions," "Morning among the Granite Boulders," and "Isles of Skomer and Skokham"; Mr. Colin Hunter, A.R.A., by "Lobster Fishers," "The Silver of the Sea," "Burial of the Macdonalds" and "The Water Carrier"; Mr. Stanhope Forbes, A.R.A., by "The Lighthouse," lent by the Manchester Corporation, and "Off to the Fishing Ground," lent by the Corporation of Liverpool; Mr. A. W. Hunt is represented by "Dunstanborough," "Hastings," "The End of the Reef" and "Tynemouth Pier"; Mr. C. Napier Hemy by "The Trammel Net," "Saved," "The Cornish Sea," "Adrift," "Falmouth Natives," "Sea Fishing" and "Oystermen"; Mr. Edwin Ellis by "The Derelict," "After Three Days' Gale," "King and Queen, Flamboro'" and "Kingdoms of the Sun"; Mr. Frank Brangwyn by "Assistance," "Stand by" and "All Hands Shorten Sail"; Mr. Tom Hemy by "Women and Children First" and "Surely the Great Waters shall not reach unto Them"; Mr. Tom Graham by "The Passing Salute," "The Last Boat" and "Nooning"; Mr. Hamilton Macallum by "A Water Frolic," "Fishermen of Positano" and "High, Low, Jack and the Game"; Mr. W. L. Wyllie by "The Britannia," "Off the Eddystone," "Yes, Sah; Sixpence, Sah," "The Spanish Armada," "Davy Jones's Locker" and ten water-colour drawings; Mr. C. W. Wyllie by "All on a Summer Day," "Littlehampton" and "The Brimming River"; Mr. H. S. Tuke by "Summer Time"; Mr. David Murray, A.R.A., by "Britannia's Anchor" and "In Dartmouth Harbour"; Mr. Edwin Hayes, R.H.A., by "Off Gorleston," "Hard-a-Port," "French Fishing Fleet" and "The Entrance to Pieve Port"; Mr. E. M. Hall by "The Mermaid's Rock," "Sigurd Carries Off the Prince of Ireland" and "Strangers on a Strange Shore"; Mr. W. H. Bartlett by "The Seal Diver" and "Wrack for the Farm"; Mr. Albert Goodwin by "Sinbad entering the Cavern," and "The Rich Strand"; Mr. Walter Langley, R.I., by "The Departure of the Fishing Fleet"; Mr. R. W. Macbeth, A.R.A., by "A Sardine Fishery." Important works by Messrs. W. Small, Walter J. Shore, Arnesby Brown, Nelson Dawson, J. Fraser, &c., enrich the collection. Among the contributors are the Queen, the Prince of Wales, the Duke of Saxe-Coburg-Gotha, the Corporations of Manchester, Liverpool, Maidstone, Leeds, Oldham, Preston, &c., Sir J. E. Millais, Bart., R.A., Sir Donald Currie, M.P., his Honour Judge Bacon, Mr. J. L. Pearson, R.A., Colonel Hargreaves, Dr. Marshall, Dr. Fox, Messrs. J. Penningham Thomasson, J. Postle Heseltine, Henry Tate, George Macculloch, W. S. Caine, M.P., S. Pope, Q.C., J. T. Brunner, M.P., James Mansergh, William Kenrick, M.P., Charles Winn, David Hedges, John Power (of Coventry), J. D. Laurie, Albert Wood, Edward Priestman, &c. A special illustrated catalogue will be prepared, and it is hoped that the collection will be opened on October 1, as the museum staff is now busily engaged in rearranging the permanent collection previous to the arrangement of the special exhibition, the contributions to which are daily being received from their respective owners.

THE "PARTI" IN THE ECOLE DES BEAUX-ARTS.

THE latest number of the *Architectural Record*, published in New York, contains, among other interesting and finely-illustrated articles, the third instalment of Mr. Ernest Flagg's description of life in the Ecole des Beaux-Arts, Paris. The following relates to one important condition in the studies:—

It is often said that the teaching of the school is not of a practical kind, that the *projets* are for buildings such as one seldom encounters in real practice, that when the student receives his diploma after years of study he is entirely ignorant of the most commonplace duties before him, but the results do not justify the criticism.

The ordinary practical affairs of everyday practice can be quickly picked up, but what is taught at the school can be learned so well in no other way and in no other place. The principles taught there can be applied as well to the cottage as to the palace, for they are the principles of good taste. One is taught a knowledge of the resources of the art and mastery of its technique.

Her atmosphere is not congenial to the growth of sentimentality; one hears little about the picturesque. The teachings of Ruskin and Turner are foreign to her methods. Her standards of art are of a higher type. Art is regarded as the highest effort of the intellect of man, the measure of his superiority over all created matter, and the human figure, the most beautiful work of the Almighty, is accepted as her canon and guide.

The evidence of the intellect of man in architectural design lies in the symmetry and logical disposition of the parts as shown principally upon the plan. M. Charles Blanc reminds us that man alone of created beings can trace a geometrical figure.

The lesson of the human form as applied to such design is perfect symmetry to the right and left of the central axis and diversity from head to foot. On this principle has every masterpiece of architecture from the earliest record of man been conceived. Success or failure at the school, so far as the architect is concerned, depends chiefly upon his ability to seize the *parti*.

This word *parti*, as used at the school, means the logical solution of the problem, and as every true architect must have two natures, the practical and the artistic, the *parti* must be the logical solution of the problem from his dual standpoint as constructor and artist. The ability to grasp the right *parti* is a gift of nature; it can be acquired only to a limited degree. It is the characteristic of genius in architecture. Without this gift no man can ever hope to become a great architect.

A certain *parti* for the *projet* is taken by every student *en loge* during the twelve hours allowed for the sketch; but the *parti*, as it is called—that is, the *parti* par excellence, or a solution which is logically right from the artistic and practical standpoint—is seldom taken except by the gifted or by the learned. If by the latter it conforms to the traditions of the school, and is awarded a mention. If by the former it shows originality and thought, and the maker receives a medal or a prize, as case may be. For originality which conforms to the laws of good taste more than anything else receives encouragement at the school.

As the *parti* is most clearly shown on the plan, the plan becomes the chief consideration, and upon it is lavished by far the greatest study and care.

For the same reason the plan is the chief consideration of the jury; it is scarcely an exaggeration to say that in making awards the plan counts for nine points out of ten.

Where so much attention is paid to the *parti*, architecture cannot be very bad.

The consideration of the *parti* militates against many things of which we in this country are fond. Where the *parti* is considered affectations disappear, for the design must conform to the dictates of reason. The same consideration makes it necessary to comply with the laws of health and convenience in structures to be occupied by man. Where the *parti* is considered people do not build miles upon miles of tenements lighted only at the front and rear, having slits—courts, so-called, 4 feet wide, on which open all bedrooms, a menace alike to the health and morals of the community—buildings often occupied by twenty families on land barely sufficient for two or three. Rich men do not build country *châteaux* against the street lines of cities, nor do communities claiming to be civilised and refined make choice of barbarous styles of architecture, like the Romanesque, for instance, in which to express their aspirations.

To say nothing of the artistic considerations, the study of the *parti* saves to France millions upon millions yearly, for careless planning is one of the most expensive pursuits a nation can engage in, and such planning is seldom found in France. The room thus saved is devoted to light and air. Paris is perhaps more densely populated than New York, but the buildings are properly lighted.

In Paris the *parti* of the city, too, is considered. One does not see there buildings of ten, twelve and even twenty storeys rearing themselves, monuments alike to the greed of the landowner and the folly of the community which permits such blemishes on the beauty of the town.

The *parti* is always dictated largely by common sense; it wars against ignorance, vulgarity, waste and ugliness in architecture. Its characteristics are fitness, beauty, convenience, economy and reason.

Because we do not consider the *parti* we were surprised that the French did not admire the buildings of the late Chicago exhibition; viewed from their standpoint in respect to the *parti*, they were a gigantic failure. In the opinion of France, America is the champion of progress. America is modern, America is free. Judge, then, of her surprise to find at the exhibition, which was to show to the world her progress, her civilisation, an array of buildings evidently inspired and often slavishly copied from French school drawings of ten, fifteen and twenty years ago. Buildings, too, which were precisely what they pretended not to be, illustrating nothing new in building and nothing new in art.

Having made the sketch and taken his *parti*, the student's duties henceforth, so far as the *projet* is concerned, lie at the atelier and with his *patron*. The system is a simple one. He goes to school, lays out his work, then takes it home to the atelier and completes it, always providing, however, the *patron* consents. If the *parti* is too bad, the *patron* will forbid his rendering or else advise him to boldly depart from the sketch and be placed *hors de concours*, on the theory that, as he

must lose in any case, it is better to do so with honour than ignominiously.

The relation between the *patron* and the pupil is a most intimate one. The very fact of the student's seeking admission to the atelier is an act of homage to the master, an assurance of sympathy and admiration on the part of the applicant. The *patron* takes an almost paternal interest in his pupils, and they on their part regard him with feelings of unbounded admiration. Their interests are the same, for the rivalry between the ateliers is not confined to the students alone. So close is the relationship between the school and the profession that a man's reputation, at least among his brother architects, depends largely upon the work of his pupils.

To the pupil the *patron's* door always stands open. No matter whom else may be denied admission, the pupil, be he never so poor, is sure of a cordial reception. On such occasions the *patron's* manner is most charming, but at the atelier small time is lost on ceremony. At his stated visits he passes from student to student without word or sign of recognition. He examines the work and expresses his opinion in words impossible to misunderstand. Praise is sparingly used and seldom goes beyond the expression *pas mal*. Upon occasions he indulges in ridicule and when the case requires, words of biting sarcasm bring the blood to one's face.

The *patrons* of all the great ateliers are members of the Academy of Fine Arts, and as such serve on the juries of the school. At the judgment the *patron* is always on hand, as well to defend the work of his pupils as to see that other ateliers do not carry off more than their legitimate share of honours.

I have had no personal experience with the *patrons* of other ateliers, but of Monsieur Blondel I can give an account.

He is a man about forty years old, handsome, of fine physique and dignified bearing; he has a keen blue eye which meets yours squarely. There is about him an air of manly decision well calculated to inspire confidence, and the evident and kindly interest he takes in those of his pupils who are in earnest soon wins for him their affectionate regard.

Wonderfully gifted by nature, he has besides at his command the resources of the most superb education in architecture which the Government of France can give. Moreover, he is a born instructor. He sees everything, forgets nothing, and decides with a precision and justness which excites the admiration of his pupils. He is as much interested in their work as they are themselves. Or at least he has to a remarkable degree the faculty of inspiring them with that belief. When he examines a design his eye takes in everything. No moulding so fine that he does not regard its contour, no *point de pochet* so small as to escape his notice. He is alike master of the noblest conceptions and the most refined detail.

His visits are the chief events of ordinary life at the atelier. As he enters a hush falls on the place which is not broken until his departure. As he approaches each student in turn the latter rises deferentially and stands aside while the *patron* seats himself on a *tabouret* and looks over the work.

At first I find these visits somewhat trying, for his criticisms are not complimentary. "Young man," he says, "this all looks old. I have seen that door at Verona, that window in Florence, that cornice in Rome. This is a compilation, not architecture but archæology. You are here to learn architecture, the noblest of the fine arts. It is not by compiling or copying even the greatest works of others that you can hope to succeed, but by learning to appreciate and to apply the principles that guided the designers." Monsieur Blondel is severe; he does not realise that I came from a place where it is considered highly respectable and eminently proper not only to steal parts of a design, but to reproduce European buildings entire, and palm them off as one's own.

He passes to another *nouveau*. This young man has been working for several days, has encountered many difficulties and is anxiously awaiting his criticism; he gets it, but not in the way he expects. The *patron* glances at his work but does not deign to seat himself. He says, "You do not know enough to draw an axis," then passes on. The lesson is short but not likely to be forgotten. The student has learned one of the fundamental laws of architectural design. Next time he will begin his work with the principal line.

How many practising architects here and in England need to be taught the same lesson.

The next student has been *en loge* and shows him his sketch.

"What is that," he says, "a church?"

"No, monsieur; a theatre."

"Oh! it's a theatre. Have you your mention in descriptive geometry?"

"No, monsieur."

"Devote your attention to that during the next two months."

In the atelier there are many strong men members of the first class, logists and some who have already received their diploma. From these one learns scarcely less than from the

patron himself, for they are ever ready to help and advise. They have spent years under the *patron's* eye and know his methods. It is interesting to see with what respect these men regard the master. His judgment is their final appeal. If they are masters of technique he is past grand-master. No man can do a thing so well but that he is ready to admit the *patron* can do it better. From the original conception to the finishing stroke of the *rendu* the *patron* stands unrivalled.

THEORETICAL TEACHERS OF ART.

THE Tyneside Sunday Lecture Society having invited Mr. Holman Hunt to lecture before them, the painter has sent the following reply to the Secretary:—

Draycott Lodge, Fulham, S.W.

Dear Sir,—I feel that it is an honour to be asked to lecture to the Tyneside Lecture Society, and I should have pleasure were it possible to do so; but I am obliged to manage my time very carefully now, that I may lose as little as possible from my painting; and to come to Newcastle during the season of your addresses would be a serious risk to my health and a great disturbance to my professional duties. Were I to speak on Art, my one strain from beginning to end would be to caution my audience in their judgment against the authority of the theoretical teachers, and to advise them to rely instead on their own best judgment. I imagine that their interest in the subject would be not as practical artists, but as men with a desire to cultivate a sound sense of appreciation for what is really capable of elevating the taste. For this there are many treacherous snares in the present day. Doctrinaires go about laying down dogmas—for instance, that all work should have moral teaching or that it should have none; that everything should be minutely finished or that it should be done as much as possible without exact elaboration; that everything should be idealised, or that nothing should be more than real, or different from the accidental fact. This is but a brief enumeration of the laws laid down by theorists, who are all wrong in making hard and fast rules. You will have heard of the different fashions of the day, and you will have seen some of the productions of the new schools. My advice is not to be taken in by any declaration that such a work is in the "correct style." If a work does not on sober examination give you the conviction that nature in that phase is sweeter or nobler than you thought before, it is not good for you, and do not be frightened out of your judgment, which on Art ought to enable you to decide on the value of a particular work as much as you can on other questions. Some delights are not lasting. Seek those that train the soul to love life, your fellow individuals and the community at large, and eschew all others.—

In haste, yours very faithfully,

W. HOLMAN HUNT.

GENERAL.

An Old English Fair has been opened at Bootle, in aid of the building fund for the proposed erection of a parochial hall in connection with St. Matthew's Church. The cost of the building is estimated to be about 3,000 guineas.

Mr. George G. Benn, Rugby, has offered a sum of 10,000/- for a new spire and peal of bells for the parish church.

The first of the ninth annual winter course of lectures in connection with the professional examination of the Surveyors' Institution will be delivered by Mr. Philip E. Pilditch, F.S.I., on Tuesday, October 2, at 7 P.M., for Associates, and on Friday, October 5, at 7 P.M., for Fellows, at 2 Duke Street, Charing Cross.

An Act has been passed by the legislature of Cape Colony for the registration of designs, and in its provisions mainly corresponds with the English law.

M. Martin, the engineer whose name is associated with the Westinghouse break, has died at Rouen.

The New School which is to be erected for the Cathcart School Board is to provide accommodation for 1,000 pupils, the allowance being 10 square feet of floorage for each. The cost is not to exceed 9/- per scholar, although a cookery-room and a swimming-pond will be provided. The following Glasgow architects have been invited to compete:—Mr. Robert Ewan, Messrs. Clark & Bell, Messrs. H. & D. Barclay, Mr. W. G. Rowan, Mr. D. McNaughton, and Mr. T. Watson, West Regent Street.

The Plans of Mr. T. Taliesin Rees have been selected in a limited competition for the Wesleyan Church and Schools, Bebington, and the carrying out of the work entrusted to him. The style of the buildings is Late Gothic. The materials are of red pressed bricks with white stone dressings and tracery. It is the intention of the committee at present only to erect the school chapel, which contains seating accommodation for 250 adults, minister's vestry, two class-rooms, kitchen, lavatories, &c. The future church has been arranged to seat 600 adults, with church parlour, vestries, organ-chamber, &c.

The Architect.

THE WEEK.

THE inquiries which were repeated at the meeting on Tuesday of the City Commission of Sewers, about the demands of one of the district surveyors for fees of two guineas each from shopkeepers in the City as a consequence of a free interpretation of the Sky Signs Act of 1891, are not likely to be heard when the new London Building Act comes into operation, for more care has been taken to define what a sky sign is and is not. It is an announcement which "shall be visible against the sky," and cannot therefore comprise "everything hanging from a shop-front," which Mr. MORTON, M.P., described as the interpretation of the surveyor. Moreover, the licenses for some existing sky signs are to be renewed for one further period of two years on their expiration, but not longer, and others for a second term of two years only. The duration is therefore brief. Fortunately, there are to be no successors to them within the metropolitan area, for, according to clause 127 of the new Building Act, "from and after the commencement of this Act it shall be unlawful to erect any sky sign as defined in this Act." The district surveyor whose conduct was discussed at the Commission of Sewers has been a public benefactor, for the demand for fees has been more effectual than any invective in convincing people that sky signs were a nuisance by which the purses of innocent people could be lightened.

A MEETING of sanitary inspectors was held in connection with the Congress at Liverpool on Wednesday, when the following resolution was unanimously adopted:—This meeting is of opinion that in the interest of the public health of the country (1) it is no longer expedient that appointments as medical officers of health, sanitary inspectors and inspectors of nuisances, should be made for definite periods of time. (2) It is desirable that the powers of the Local Government Board with regard to tenure of office should be extended so as to apply equally to all medical officers of health, sanitary inspectors and inspectors of nuisances, whether they be paid entirely out of local rates or not. (3) It is desirable that county councils should have the power of making representations to the Local Government Board either for or against the dismissal of such medical officers of health, sanitary inspectors and inspectors of nuisances, as are partly paid by such county council. And that the council of the Sanitary Institute be recommended to forward the resolution to the proper authorities." The information given to the meeting about the inadequate salaries paid to inspectors in Yorkshire, and which correspond with the amounts paid elsewhere, suggests the indifference in which sanitation is held by the majority of local authorities. It was found that in urban districts two received 4*l.* a year, one 5*l.*, four 6*l.* to 10*l.*, seventeen 20*l.* to 30*l.*, twenty 30*l.* to 40*l.*, seven 40*l.* to 50*l.*, six 50*l.* to 60*l.*, six 60*l.* to 70*l.*, four 70*l.* to 80*l.*, seven 80*l.* to 90*l.*, and ten from 100*l.* to 250*l.* Taking the rural authorities areas, two inspectors received 12*l.* to 20*l.*, two 20*l.* to 30*l.*, three 30*l.* to 40*l.*, five 40*l.* to 50*l.*, four 50*l.* to 60*l.*, two 60*l.* to 80*l.*, and thirteen whose salaries ranged from 80*l.* to 200*l.* To pay officers in that way is to put a premium on dishonesty, for poor men are likely to be tempted if bribes are offered to ignore breaches of the sanitary acts.

THE anecdote which Mr. HENRY IRVING related in an address he delivered at Walsall suggests the difficulties which sometimes arise when there is a departure from the letter of building regulations. Some time ago Mr. IRVING said he was tempted to make a little experiment on his own account, and without the invaluable advice of the authorities. To prevent crowding at the entrance to the Lyceum pit he set up a mechanical contrivance which compelled the people to wait in a line, and pass through the pit doors in single file. Strange to say, the public overwhelmed him with gratitude. The ingenuity and convenience of the contrivance were greatly admired, especially as it was

always moved away when the audience had taken their seats. He began to flatter himself that he had done the State some service. But this dream was soon over. There came a rather peremptory note one morning ordering him to remove the beautiful apparatus which was the public joy. When he sent a message of meek inquiry as to the rhyme or reason of this mandate, the answer was that the invention was dangerous to the public. With scrupulous delicacy the theatres committee had gone out of town, to avoid, no doubt, any risk of hurting his susceptibilities by consulting him in a matter on which he might venture to have an opinion; so he was left to wonder more than ever at the sublime intelligence which assumed that panics took place outside a theatre, and must be prevented by interdicting a successful device for making it easier to get inside. Mr. IRVING would, no doubt, be ready to admit that his contrivance if not removed would be as effective in preventing egress from his theatre. It is not impossible that some of his assistants would be forgetful and allow the contrivance to remain, and a panic might occur on that occasion as at any other time. The obstacle would therefore be a danger and as such the County Council were prudent to show disapproval of it. Temporary appliances are not contemplated in the parliamentary regulations for theatres, and it is hardly fair to cast any blame on the County Council, who have great but thankless responsibility.

By the new London Building Act, the County Council can at any time they may determine pay a district surveyor a salary instead of fees. The amount is to be not less than the average of the fees received in the preceding seven years. The fees which would have been payable to the surveyor are to be paid to the Council and carried to the credit of the County Fund. The Council may also provide either wholly or partially for the payment of salaries to the district surveyors or to any of them out of the fund, and may thereupon abolish or reduce any of the fees that are payable to the surveyors. Monthly returns are to be sent in by the district surveyors, which will be examined by the superintending architect, and "if any fees therein specified appear to him to be unauthorised, or to exceed in amount the fees so authorised, or if any such account appears to be in any respect fraudulent or incorrect, he shall make his report in writing to that effect to the Council, who shall thereupon take such steps in the matter as they deem expedient."

AN important arbitration case was opened before Mr. C. OAKLEY at the Surveyors' Institute. Mr. J. LOWTHER, M.P., as the trustee of the estate of the Earl of LONSDALE, claims 12,920*l.* from the Manchester Corporation for materials for easements taken over properties and damage to them arising from constructing through them the aqueduct and pipes which are to convey water from Thirlmere to Manchester. Stone and gravel used in the works are charged for at 1*s.* per cube yard, and stone which was used in spoil banks is charged at 2*s.* a yard. The easements are in some places valued at 4*s.* per yard per annum, but in prospective building land the value is put down at 2*s.* per yard for bridges and pipes, and 3*s.* a yard for works where the surface of the land was altered. For "wayleave" through underground property 100*l.* per mile is claimed.

By the death of Baron JEAN BAPTISTE BETHUNE, president of the Belgian Archaeological Society of St. Thomas and St. Luke, Belgium has lost one of its greatest archaeologists and the Society of Architects of this country a most distinguished honorary member. Baron BETHUNE was a Knight Commander of the Order of St. Gregory the Great, a Knight of the Order of Leopold, vice-president of the chief Belgian antiquarian societies, and honorary member of many continental societies devoted to archaeological research. In early life Baron BETHUNE was attached to the Belgian Legation in London. He visited England last year, when he attended a soirée given by the Society of Architects and testified in an eloquent speech to the admiration for English architecture which his fellow-countrymen possessed.

THE LONDON BUILDING ACT, 1894.

THE new Act, which supersedes several Metropolitan Building Acts as well as other Acts relating to London, consists of sixteen parts and two hundred and eighteen clauses, besides schedules referring to dimensions, materials, fees, &c. It will come into operation on the first day of next year.

The first part is introductory, and contains definitions of expressions which are more numerous than in the preceding Building Acts. In some cases the old definitions are retained. In others there are alterations. For instance, there are two definitions of "party wall." It is "a wall forming part of a building and used, or constructed to be used, for separation of adjoining buildings belonging to different owners, or occupied or constructed or adapted to be occupied by different persons." It is also "a wall forming part of a building and standing to a greater extent than the projection of the footings on lands of different owners." Among the public buildings is comprised "a building used or constructed or adapted to be used as an hotel, lodging-house, home, refuge or shelter where such building extends to more than 250,000 cubic feet, or has sleeping accommodation for more than one hundred persons." As in the older Acts, there is no recognition of architects, with the exception of the Council's superintending architect. All the procedure can be carried out if necessary by the building owners or builders.

The second part contains the clauses relating to

Formation and Widening of Streets.

Before any street for carriage or foot traffic is formed or laid out it will be necessary to make application to the Council, accompanied by plans, sections and other particulars described in printed regulations, and to obtain their sanction. The erection of a fence or other boundary, laying down kerbing, levelling ground to define direction, or forming foundation of a house which will become one of three or more abutting on line of proposed street, will be deemed evidence of commencement of street.

The sanction of plans of streets can be refused on seven grounds, viz. if a street proposed for carriage traffic has not a clear width of 40 feet, or one for foot traffic a width of 20 feet; or if a street over 60 feet in length, or of less length than 60 feet where the length exceeds the width, is not open at both ends; or if a street does not afford direct communication between two other streets; or if a street laid out for foot traffic does not appear desirable, or if the gradient for carriage traffic is steeper than 1 in 20; or if the proposed street would contravene any by-law. A refusal or conditional sanctioning is to be made known by notice to the applicant within two months, and the reasons are to be stated fully by the Council. If within two months the Council fail to give notice of their refusal or disapproval, they are to be deemed as having sanctioned the proposal.

Similar procedure is required in cases of adapting streets or ways for carriage traffic which were previously not suited for that purpose. The grounds for refusing to sanction adaptation of ways for streets also correspond with those described for new streets. Greater width of street may be required by the Council in cases of new streets or adapted streets not being within two miles of St. Paul's Cathedral, if it be considered that the street or streets are likely to form part of an important line of communication or for other sufficient reason. In no case, however, is a greater width than 60 feet to be required. The local authority can make a representation to the Council on the subject before any demand for exceeding 40 feet width is made.

The distance between the external walls of buildings or the external fence or boundary of forecourts and the centre of the roadway is to be at least 20 feet clear. In cases where extraordinary width is required in streets the Council can determine that the prescribed distance of the buildings shall be up to 30 feet clear on either side or both sides. Any person who is dissatisfied with the departure from the 20-feet distance may appeal to the Tribunal of Appeal that is created by Act. The Council reserve the right to consent to the erection, formation, or extension of any building, forecourt, or space at a distance less than the prescribed distance from the centre of the roadway, and subject to such conditions as may be imposed. But it is

provided that such consent shall not in any way affect any rights of the owners of adjoining land. Whenever any person intends to alter or re-erect an existing building or which did exist within seven years prior to January 1, 1895, and which is not in conformity with the provisions of the new Act, then plans are to be prepared (or the best plan available is to be produced), which are to be submitted to the district surveyor. If he testifies to their accuracy it shall be lawful to erect such building or structure, provided there is no deviation from the former limits. But if plans are not submitted and certified the provisions of the new Act will apply. It is stipulated, however, that no dwelling-house for the working classes is, without the consent of the Council, to be erected or converted within the prescribed distance from centre of roadway to a height exceeding the distance of the front wall from the opposite side of the street. Where a new building is erected within the prescribed distance without compliance with the conditions (if any) imposed by the Council or Tribunal of Appeal, notice is to be served on the owner, occupier, or builder, requiring the setting back of all parts which are in excess.

In any case where a greater width than 40 feet or more than 20 feet from centre of roadway is prescribed, the Council shall be liable to pay compensation for loss or injury to the owner of the land or buildings.

If buildings are erected at less than prescribed distance from centre of roadway, or if the conditions of Council or Tribunal of Appeal are not obeyed, the street shall not become a highway unless the parts in excess are set back according to a notice delivered by the Council in return for one proposing to making the way a public highway. The Council can sanction the construction of new buildings at less than the prescribed distance in such cases as they may think proper, provided the rights of owners of adjoining lands are not affected.

The third part deals with

Lines of Building Frontage.

Without the consent of the Council in writing no building is to be erected beyond the general line of buildings on a street unless the same line exceeds 50 feet in distance from the highway, but the section is not applicable in cases where a building stood on January 1, 1895, or any time within seven years previously. When any buildings projecting beyond the general line are taken down or destroyed by fire or other casualty to the extent of one-half the cubical area, the Council can require the buildings to be set back to the line, compensation being paid to the owner.

The general line is to be defined by the superintending architect in a certificate which is to be served on those to whom it relates, and the local authority, or any person deeming himself aggrieved, can appeal against it to the Tribunal of Appeal. In consenting to any departure from the general line the Council may require that the land in front of the building is dedicated to public use, or that the building shall be used for specified purposes alone, or any other condition which the Council may deem it expedient to propose in the public interest. Consent respecting one part of a line does not apply to the remaining parts. This part of the Act does not apply within the City.

The fourth part relates to

Naming and Numbering of Streets.

The names proposed for streets are to be submitted for the approval of the Council. The names are to be affixed and renewed by the local authority. The Council can alter the name of any street, but notice is to be given a month beforehand, and objections will be considered. The numbering of houses can also be ordered. Power is reserved that, in default of the local authority complying with the order, the Council may perform all such proceedings as are necessary in connection with the naming and numbering of streets. A register is to be kept for public inspection showing all alterations made in the naming or numbering of streets.

The fifth part is a "new departure," for it contains the enactments for

Open Spaces about Buildings and Heights of Buildings.

All domestic buildings erected after January 1, 1895 (exclusive of those used or constructed or adapted wholly or principally as offices or counting-houses), having habit-

able basements, are to have in the rear an open space of not less than 100 square feet for the purpose of giving light to such basement.

Every domestic building abutting upon a street formed or laid out after the commencement of the Act, is to have in the rear an open space of not less than 150 square feet. Where there is a basement storey with the prescribed 100 square feet of open area,

irrespective of any use to which the ground storey is appropriated, or where there is no such basement storey, but where the ground storey is not constructed or adapted to be inhabited, the open space required by this section may be provided above the level of the ceiling of the ground storey, or a level of 16 feet exclusive of lantern lights measured from the level of the adjoining pavement. In all other cases the open space shall be free from any erection thereon above the level of the adjoining pavement, except a water-closet, earth-closet or privy, and a receptacle for ashes, and enclosing walls, none of which erections shall exceed 9 feet in height. Such open space shall extend throughout the entire width of such building, and to a depth in every part of at least 10 feet from such building.

The relation between the height of a building and the open space in the rear is to be ascertained as follows:—
1. A horizontal line is to be drawn at right angles to the roadway, and at pavement level in ordinary cases, through the centre of the face of the building until it intersects the furthest boundary of the open space. 2. A diagonal line is then to be drawn in the same vertical plane with the horizontal line and inclined thereto at an angle of $63\frac{1}{2}$ deg., and meeting the horizontal line where it intersects the boundary of the space furthest removed from the roadway. With the exception of chimneys, dormers, gables, turrets or other architectural ornaments, aggregating in all to not more than a third of the width of the rear elevation, no part of a building is to extend above the diagonal line. Where the pavement in front is not level the mean level of the pavement is to be adopted, and where the rear boundary is not parallel with the rear wall of the building, the mean distance is to be adopted. If the boundary is very irregular, application for advice is to be made to the Council or if necessary to the Tribunal of Appeal. If the land at rear abuts on a street or public space, the horizontal line is to be produced and the diagonal line may be drawn from a point at the centre of the roadway of such street or at the further boundary of such space, "and it shall not be necessary to provide any open space at the rear of such building." In case of sites at a corner abutting on two streets, or on a street and an open space not less than 40 feet wide, the Council may permit the erection of buildings up to 30 feet in height upon such part of the rear as they think fit, provided they do not interfere unduly with the access of light and air to the neighbouring buildings. A building on a corner site can be carried up to the full height of the front elevation for a distance of 40 feet on the return front, or for such less distance as the requirements for open space at the rear may demand. With sites of irregular shape the Council may allow modifications subject to appeal to the Tribunal.

When buildings abut on old streets the horizontal line is not to be drawn on pavement level but 16 feet above it (except in case of houses to be inhabited by persons of the working class), and the prescribed open space may be provided above the level of the ceiling of the ground storey or above a level of 16 feet (exclusive of lantern lights) above the level of the adjoining pavement.

A building may extend beyond the diagonal line if the Council or Tribunal shall be satisfied that an equivalent open cubic space of air will be provided at the rear. The section is not applicable to houses abutting on the river Thames, on a public park, or on an open public space of not less than 80 feet in depth.

Special provisions are likely to be enforced for working-class dwellings which do not abut upon a street. After the plans are delivered, which, it is presumed, will correspond with the general regulations for domestic buildings, the Council can refuse to sanction them if they are satisfied, "taking all the circumstances of the case into consideration, that there will not be provided about such dwelling-house a sufficient open space or spaces for the admission of light and air thereto." Without the sanction the dwellings are not to be commenced.

Houses on old sites can be re-erected after the plans

showing former state are verified by the district surveyor, "so that no more land shall be occupied by the newly-erected building than was occupied by the previously-existing domestic building as so certified." Some deviations may be permitted if the Council think fit. The Council may also modify or relax the provisions of the section in respect of new streets on a cleared area.

In courts within a building there is to be adequate provision for ventilation by means of a communication between the lower end of the court and the open air. No habitable room having a window opening into the court is to be constructed unless there is one also directly opening into the external air, or unless the width of the court from the window to the opposite wall shall be equal to half the height measured from the sill to the eaves or top of parapet of opposite wall. A court of which the greater dimension does not exceed twice the less dimension shall be held to comply with the section, if a court of the same area but square in shape would comply therewith. "No habitable room above the level of the ground storey not having a window opening into the external air otherwise than into a court open on one side, the depth whereof measured from the open side exceeds twice the width, shall be constructed in any building unless every window of such room be placed not nearer to the opposite wall of such court or to any other building than one-half the height of the top of such wall or building above the level of the sill of such window." When necessary the superintending architect may define front or rear of buildings.

A building (not being a church or chapel) is not to be erected, or subsequently increased, to a greater height than 80 feet (exclusive of two storeys in the roof and of ornamental towers, turrets, or other architectural features) without the consent of the Council. Contracts entered into before 1895 for buildings of greater height can, however, be carried out. Higher buildings existing before 1895 can also be re-erected without diminution of height. If part of a continuous block or row exceed the 80 feet, any of the other buildings can be raised to the height of that part. Where greater height is allowed, notice of Council's consent is to be published, and the consent is not to be valid until twenty-one days have lapsed from publication. An owner or lessee of a building or land within 100 yards of the intended high building can appeal to the Tribunal.

In streets laid out after August 7, 1862, which have less width than 50 feet, no existing building except a church or chapel is to be raised, and no new building erected of greater height than the width from the external wall to the opposite side of street, without the consent of Council. On corner sites the height is to be determined by the width of the wider street so far as the building abuts on the narrower street for a distance of 40 feet. Existing buildings of greater height may be re-erected to that height. The height of buildings can be likewise increased to such an extent as may be necessary to bring habitable rooms in the topmost storey into conformity with the provisions of the Act. Working-class dwellings can be re-erected by a local authority and retain former dimensions. Domestic buildings with stables in the rear, on sites with a depth of not more than 150 feet, if the stables are limited to a depth of 50 feet and a height of 25 feet may be deemed to be one domestic building with the rear abutting upon the street.

In the sixth part we arrive at the important subject of

Construction of Buildings.

The structure and thickness of walls is defined in the schedules, which we give elsewhere. The regulations upon recesses and openings correspond with those in the Act of 1855, excepting that recesses in party walls are not to come within $13\frac{1}{2}$ inches of the inner face of the external walls, instead of 12 inches, and that the arch over one of those recesses is on each storey to consist of at least two rings of brickwork of the full depth of the recess, except in the case of recesses formed for lifts. Where the recess does not exceed 5 inches in depth, corbelling in brick or stone may be substituted for the arching. The superintending architect has the power to consent to modifications or relaxations of the section with respect to the area of recesses and openings.

Loophole frames were allowed to be fixed within $1\frac{1}{2}$ inch of the face of any external wall; henceforth they

can be made flush with the face, and so can frames of doors and windows. As formerly, timber in external walls, with the exception of bressummers, storey-posts, frames of doors and windows of shops, are to be set back 4 inches from the external face of the wall.

The bearing of wood or metal bressummers is to be 4 inches at each end, as before, but the ends of wooden bressummers can come within 4 inches of the centre-line of party walls instead of $4\frac{1}{2}$ inches. A space for expansion calculated at a $\frac{1}{4}$ inch for every 10 feet or fraction of 10 feet is to be allowed at each end of a metallic bressummer. A bond of timber or wood-plate built into a party wall, and the ends of any beam or joist resting on party walls, may be 4 inches from the centre-line instead of $4\frac{1}{2}$ inches. The rule about the templet or corbel for a bressummer bearing on a party wall is unaltered. "The end of any timber not permitted to be placed in or to have a bearing on a party wall may be carried on a corbel or templet of stone or iron or vitrified stoneware tailed into the wall to a distance of at least $8\frac{1}{2}$ inches, or otherwise supported to the satisfaction of the district surveyor." The rule about gutters and parapets to external walls is unaltered.

A wall is to be deemed a party wall for such part of its length as is so used when, after January 1, 1895, it is built as a party wall in any part, or where one built at any earlier time becomes a party wall.

In warehouses party walls are to be carried up above roof at least 3 feet and of a thickness equal to the thickness of the wall in the topmost storey, and in other buildings 15 inches above the flat or gutter of the highest building adjoining, or measured at right angles to the slope of the roof, the thickness being $8\frac{1}{2}$ inches. If there is any turret, dormer, lantern-light or erection of combustible materials on the roof within 4 feet of the party wall, the wall is to be at least 12 inches higher and wider on each side than such erection.

The rule for chases in party walls corresponds with that of 1855. No chase is to be wider than 14 inches, nor more than $4\frac{1}{2}$ inches deep from the face, nor so as to leave less than $8\frac{1}{2}$ inches thickness at the back or opposite side, and no chase is to come within a distance of 7 feet from any other chase on the same side or within 13 inches from an external wall. No chase is to be made on a wall of less thickness than 13 inches.

Flats, gutters and roofs and erections thereon are to be covered externally with incombustible materials, except doors, windows, barge-boards, &c., which may be of wood. Buildings above 30 feet high used wholly or partially as dwelling-houses or factories are to be provided with proper means of access to the roof. As before, the plane of the surface of warehouse roofs is not to exceed 47 deg.; in other buildings it is not to exceed 75 deg. Towers, turrets and spires are not included. Not more than two storeys are to be constructed in the roof of any domestic building. If the floor is at a height of more than 60 feet from the street level, it is to be constructed of fire-resisting materials. Every building exceeding 60 feet in height is to be provided with means of escape from the upper part in case of fire, and the building is not to be occupied until a certificate of the existence of that provision is issued by the Council.

There are some variations from the former Act in the rules for chimneys and flues. Chimneys are allowed to be "carried upon iron girders with direct bearings upon party, external or cross walls to the satisfaction of the district surveyor." Chimneys and flues could be constructed at any angle if there were proper soot doors of 6 inches square; henceforth the doors are to be not less than 40 square inches. It used to be said, "in every other chimney or flue the angles shall be constructed of an obtuseness of not less than 130 deg. and shall be properly rounded." The new rule is, "chimneys and flues having proper soot-doors of not less than 40 square inches, but in no other case shall any flue be inclined at a less angle than 45 deg. to the horizon, and every angle shall be properly rounded." The abutments or chimney-breasts projecting more than $4\frac{1}{2}$ inches had to be tied; by the new Act the abutments must be tied if the projection exceeds 4 inches. A flue in connection with a boiler or close fire used for trade or business, or the range or cooking apparatus in a hotel, tavern or eating-house, will be

illegal unless it is surrounded with brickwork at least $8\frac{1}{2}$ inches thick from the floor on which the boiler or apparatus is situate to the level of the ceiling of the room next above the same. Flues used in connection with steam boilers or hot-air engines must be at least 20 feet in height measured from the floor on which the engine stands. The inside of every flue and the outside when passing through any floor or roof, or behind or against any woodwork, must be rendered, pargetted or lined with fire-resisting piping of stoneware. The position and course of every flue must be distinguished on the outside of the work. The regulations numbered from 5 to 17 of clause 19 in the Act of 1855 are adopted with a few slight changes. For instance, slabs of fireplaces, which were required to be 12 inches longer than the opening, need not be more than 6 inches longer. Slabs or hearths may be 6 inches thick instead of 7 inches. Timber could not be placed within 18 inches of the surface of the hearth; the new rule is "within 10 inches from the upper surface of the hearth." The highest six courses of every chimney-shaft or stack are to be built in cement.

Furnace chimney-shafts are to be in the best brickwork and mortar, and if detached are to taper at least $2\frac{1}{2}$ inches in 10 feet. The brickwork for the uppermost 20 feet is to be at least $8\frac{1}{2}$ inches thick, and is to be increased at least one-half brick for every additional 20 feet measured downwards. Every cap, cornice or other variation from plain brickwork is to be provided as additional to the brickwork; the cap and foundation are to be constructed to the satisfaction of the district surveyor. The width of a square shaft at base is to be at least a tenth of the height, and of a round or other shape a twelfth of the height. Firebricks inside the lower portion of the shaft are to be additional to the prescribed thickness of brickwork, with which they are not to be bonded.

Floors under ovens, coppers, steam boilers or stoves, and which are not heated by gas, are to be formed of incombustible and non-conducting materials 6 inches thick placed around for a space of 18 inches. Pipes for conveying products of combustion, heated air, steam or hot-water are not to be fixed on the face of a building adjoining street. A pipe conveying smoke or other products of combustion is not to be placed nearer than 9 inches to any combustible material; for heated-air pipes the distance is 6 inches, and hot-water pipes 3 inches, unless in the case of pipes for conveying water and steam at low-pressure. The floor of any room or enclosed space in which a furnace is fixed and any floor within 18 inches from the crown of an oven is to be fire-resisting.

In every public building and building of more than 125,000 cubic feet in extent which is to be used for separate families, floors of lobbies, corridors, passages, landings and the flights of stairs are to be fire-resisting and supported by a fire-resisting material.

The principal staircase is to be ventilated on every storey above ground storey of every building occupied by more than two families by means of windows or skylights or other adequate means, and the principal staircase in every dwelling-house is also to be ventilated by windows or skylights. Habitable rooms, unless wholly or partially in the roof, are to be at least 8 feet 6 inches from floor to ceiling. Those in roof are to be 8 feet high throughout not less than half the area. Every room is to have one or more windows opening into the external air with an unobstructed area, exclusive of sash frames, of at least one-tenth of the floor area of the room, and a part equal to at least one-twentieth of the floor area capable of opening. In rooms lighted wholly or partially from the roof the window area is to be at least one-twelfth of the floor area and the part to open one twenty-fourth of that area. Basements with wooden floors are to have air-bricks or other ventilators. A room for habitation over a stable is to have a floor of concrete 3 inches thick finished smooth, and the staircase or other approach is to be separated from the stable by a wall of 9-inch brick.

Every party arch over a public way or any passage under a building is to be of brick, stone or other incombustible materials. In the case of brick and stone the thickness is to be $8\frac{1}{2}$ inches, with a rise of an inch per foot; and if other material the arch is to be constructed to the approval of the district surveyor. Arches under public ways up to 10 feet span are to be $8\frac{1}{2}$ inches thick, up to 15 feet span

13 inches; and when the span is greater the thickness is to be as district surveyor shall approve.

Every coping, cornice, string-course, fascia, window-dressing, portico, porch, balcony, verandah, balustrade, outside landing, outside stairs, outside steps and architectural projection or decoration, also the eaves, barge-boards and cornices to any overhanging roof—with the exception of cornices and dressings to shop window-fronts and eaves, barge-boards and cornices to detached and semi-detached dwelling-houses with party walls projecting 4 inches beyond them—are to be of brick, tile, stone, artificial stone, slate, cement, or other fireproof material. Every balcony, cornice, or other projection is to be tailed into the wall and weighted or tied down to the satisfaction of the district surveyor. No cornice is to project more than 2 feet 6 inches over public way. In streets which are 30 feet wide and under, a shop front may project 5 inches beyond the external wall and its cornice 13 inches, and in streets of greater width the projection of front may be 10 inches, and of cornice 18 inches. No part of the wood-work of a shop-front is to be higher than 25 feet above the pavement or to be nearer than 4 inches to the centre of the party wall or face of separate wall belonging to adjoining premises, unless a pier or corbel 4 inches wide is placed as high as the woodwork and projects an inch between wood-work and wall.

In streets not less than 40 feet wide bay windows can be erected provided that they do not exceed three storeys in height above the footway, do not project more than 3 feet from the main wall of the building, or in any part do not project within the prescribed distance of the centre of the roadway, are in no part nearer to the centre of the nearest party wall than the extreme amount of their projection from the main wall of the building, do not, when taken together, exceed in width three-fifths of the frontage of the building, are not constructed upon the public way and are not to be used for trade purposes.

Projecting oriel windows or turrets can be constructed in streets not less than 40 feet wide, provided that they do not project more than 3 feet from the building, or more than 12 inches over the public way, that no part is less than 10 feet above the footway, or within 4 feet of the centre of the nearest party wall, and that on no floor shall the total width exceed three-fifths of the length of the wall of the building on the level of that floor.

Roofs, balconies, verandahs, shop fronts, &c., are to be so arranged and supplied with gutters as to prevent the water from dropping or running over any public way. Every building is to be separated from the adjoining building or buildings either by a party wall or walls or by other party structure. In every building exceeding ten squares in area, used partly for trade and partly for a dwelling-house, the former part is to be separated from the latter by walls and floors of fire-resisting materials, as well as the passages, staircases, and other means of approach to the dwelling-house part. Doorways may be constructed in the walls of staircases and passages and openings in the walls, if fitted with fire-resisting doors. Every building exceeding twenty-five squares in area, containing separate sets of chambers or offices, is to have floors and principal staircases of fire-resisting materials. It is announced that the provision does not entitle the district surveyor to charge for the inspection of each set of chambers as a separate building.

A building of the warehouse class is not to extend to more than 250,000 cubic feet, unless divided by party walls in such manner that no division extends to more than that capacity. No addition is to be made to the warehouse or any of its divisions by which the 250,000 cubic feet shall be exceeded. The restriction does not apply to buildings which are more than two miles distance from St. Paul's Cathedral, and are used wholly for the manufacture of machines and boilers of steam-vessels and retort-houses, provided they consist of one floor only and are constructed of brick, stone, iron or other incombustible material.

Where the Council are satisfied that additional cubical content is necessary for any building, and that the risks of fire will not be increased, they can allow of the increase provided that the building does not extend beyond 450,000 cubic feet, or any less number allowed, without being divided by party walls; that the height does not exceed 60 feet, and that the building is not used for any trade or

manufacture involving the use of explosive or inflammable materials. The consent is only to avail as long as the purpose of the building is unchanged.

The rules for the uniting of buildings nearly correspond with those in force since 1855. As much may be said about the clause relating to the construction of public buildings, with the exception that the Tribunal of Appeal will take the place of the Metropolitan Board of Works in case of disagreement between the owner and the district surveyor.

One clause deals with staircases in churches, chapels and other public places of assembly. Every staircase for the use of the public is to be supported and enclosed by brick walls not less than 9 inches thick. The treads are to be of uniform width. No staircase, corridor or passage is to be less than 4 feet 6 inches wide, but if not more than 200 persons are to be accommodated in the building the width may be reduced to 3 feet 6 inches. If there is accommodation for more than 400 the width is to be increased by 6 inches for every additional 100 persons until a maximum width of 9 feet be obtained. Staircases that are 6 feet wide and upwards are to be divided by a handrail. Instead of a single staircase two can be substituted with corridors and passages, each having two-thirds of the width of the single staircases and passages, but neither of the substituted stairs, corridors and passage ways is to be less than 3 feet 6 inches. In all cases where a portion of the public is to be accommodated at a higher level, a separate means of exit from each floor or level to the street or open space is to be provided. All doors and barriers shall be made to open outwards, and no outside locks or bolts are to be affixed thereto.

The foregoing abstract represents the parts of the New London Building Act which have most interest for architects. The parts about "Special and Temporary Buildings and Wooden Structures," "Rights of Building and Adjoining Owners," "Dangerous and Neglected Structures," "Dangerous and Noxious Businesses," "Dwelling-houses on Low-lying Land," "Sky Signs," "Superintending Architects and District Surveyors," "By-laws," "Legal Proceedings" and "Miscellaneous" have a different character. The Act will introduce several changes, but it will neither be as revolutionary nor as obstructive as it has been represented. Whatever may be the shortcomings of the clauses which time will reveal, the duty of architects and builders is to carry out the provisions loyally, and we have no doubt in that way London will be safer from fire, more convenient and healthier than heretofore.

KILDARE ARCHÆOLOGICAL SOCIETY.

THE annual excursion meeting of the members of the county Kildare Archæological Society has just taken place. The districts chosen were Castledermot and Kilkea, and the various matters of deep archæological interest which were brought under the notice of the members of the Society and the visitors, coupled with the fine weather and other favouring circumstances, tended to make the day's outing a pleasant one at the ruins of the Franciscan Abbey at Castledermot.

Rev. Dr. Comerford, coadjutor bishop of Kildare and Leighlin, read a paper on the history and antiquities of Castledermot. He said that like so many other towns in Ireland and elsewhere Castledermot owed its origin to a religious house which flourished there from an early period. About A.D. 500 St. Diarmuid, a holy recluse, chose the place for his hermitage, and from him it came to be named Disert Diarmada, afterwards changed to Tristledermot. St. Diarmuid was registered in the martyrology of Tallaght at the 21st of June, the day on which his feast was celebrated. The place in succeeding centuries was distinguished as a place of learning. His lordship traced at considerable length the history of Castledermot, which was several times seized by contending forces. After the battle of the Boyne, King William and his army on their way to Limerick reached Castledermot on August 14, and there he received the news of the defeat of his fleet by the French off Beachy Head. In 1734 a Charter school was founded at Castledermot, being the first erected in Ireland. In the reign of King John a priory of Crouched Friars was founded there by Walter de Riddlesford. It was situated without the town walls and adjoining the road which led to Dublin. The only portion of this monastery now remaining was a square tower, which Lord Walter Fitzgerald informed him stood in a field called the Pigeon House Park, to the north of the town. It was 39 feet high in its present state; each of the sides measured about 15 feet

and were $3\frac{1}{2}$ feet thick. Of the rest of the building there was no trace above ground, though extensive foundations were met with under the surface. Some few perches to the north-west of the tower an underground chamber was accidentally discovered a few years ago by a horse, which when ploughing put his foot through the vaulted roof. It had not as yet been explored. In 1302 a monastery for conventual Franciscans was founded in Castledermot by Thomas Lord Offaly. Considerable remains of the monastery still existed, though greatly reduced and mutilated, even within the memory of persons still living. Attached to the friary was another chapel dedicated to St. James, the patron of the district, of which one gable and portion of a sidewall remained. From under the site of the altar flowed St. James's well, which a late parish priest diverted to the other side of the gable. The Protestant church and the burial-ground surrounding it occupied the site of the original hermitage of St. Diarmuid and the monastery which sprang up around it. An ancient round tower at Castledermot had been already described in the *Journal of the Society*. It was $66\frac{1}{2}$ feet high; its doorway, which, contrary to the usual custom, was only slightly above the ground level, was square-headed, the jambs inclining towards each other at the top. Portions of these had been hacked away, probably for the admission of the bell placed in it in the last century. A considerable portion of the old church was in existence up to a comparatively recent date. At present, except such portions as were incorporated in the existing church, nothing remained but the beautiful Romanesque western doorway with its chevron decoration. Two high Celtic crosses stood in the burial-ground. Both were richly sculptured, the subjects being as usual Scriptural and religious, including, besides the central figure of the Crucifixion, David playing the harp, the sacrifice of Isaac, Adam and Eve in the Garden, the meeting between St. Anthony and St. Paul the first hermit, the multiplication of the loaves and fishes, the Twelve Apostles, &c. The tradition of the locality was that Abbot Cairpre, who died in 919 after a long life, and probably also a long tenure of office, built the round tower and the church and erected the crosses. A rude circular granite font formerly belonging to this church was rescued from being used as a drinking trough for cattle on the adjoining farm, and now lay within the ruins of the Franciscan abbey. It was not pierced. A granite stone, $2\frac{1}{2}$ feet in height above ground, stood in the graveyard. It had a Celtic cross engraved on it running its whole length, the peculiarity of which in this case was that what would have been the circle of the cross was a round hole 5 inches in diameter pierced right through. In 1863 some labourers dug up in a field near the town a very interesting relic of the past—an old Irish ecclesiastical bell of bronze. It was of the usual oblong shape, with some attempt at ornamentation in the casting. It was $6\frac{3}{4}$ inches high, and measured at the base $4\frac{1}{2}$ inches by 3 inches. In 1889 it came into the possession of the Leinster family, and was preserved at Kilkea Castle. In conclusion, his lordship said that in preparing the paper use had been made of valuable notes kindly placed at his service by Lord Walter Fitzgerald.

On the motion of the Earl of Mayo a vote of thanks was passed to Dr. Comerford.

The party then proceeded to the church, where the round tower, the two Celtic crosses and the "hole stone" were inspected. Miss Margaret Stokes entered on a minute and interesting description of the Celtic crosses, pointing out and explaining the figures and incidents sculptured on them. Lord Walter Fitzgerald gave an interesting explanation of the round tower.

A cordial vote of thanks was passed to Miss Stokes and to Lord Walter Fitzgerald. The party afterwards partook of luncheon in the adjoining schoolhouse, the catering being done by the Leinster Arms Hotel.

A start was next made for Kilkea Castle. On arriving on the grounds the Rev. C. W. Ganly read a paper on Kilkea Castle. He said the ancient district in which the castle stood was known in the twelfth century as O'Murethi, and was the property of the O'Toole Sept, to which the famous St. Laurence O'Toole belonged. Kilkea Castle was so called from the church now in ruins beside it. In old histories and documents the spelling of the name differed very much, the usual forms being Kileka, Kylka and Kilka. All these were a corruption of the Irish name "Cill Caside," meaning St. Caside's or Kay's Church. After the Norman invasion the south end of co. Clare was granted by Strongbow to Walter de Ridlesford, Baron of Bray, who evicted the Sept O'Toole, forcing them to retire to the Wicklow Mountains. In 1180 a castle was built at Kilkea for De Ridlesford by Hugh de Lacy, Earl of Ulster, at that time chief governor of Ireland. De Ridlesford's granddaughter, Emelina, heiress through her mother of the O'Murethi district, married Maurice Fitzgerald, third Baron of Offaly, and thus the manors of Kilkea and Castledermot came into, and still remained in, the possession of the Geraldines. In 1426 the castle, which had probably been sacked by the Irish, was restored and enlarged by John Fitzgerald, sixth Earl of Kildare. Its situation made it a place of

importance, as it was built in the marshes, the ground intervening between the native Irish territories and the Pale. Owing to its position it must have passed through years of unrecorded attacks. In 1573 the eleventh earl repaired the castle, and placed in the dining-hall a limestone chimney-piece, of which three sculptured stones remained. In 1797 the notorious '98 informer, Thomas Reynolds, obtained a lease of the castle and lands through the interest of Lord Edward Fitzgerald, when the castle appeared to have been partially repaired and furnished.

Rev. Mr. Ganly enumerated the features of special interest in the castle. First, there was the "evil-eye stone," which was built 17 feet above the ground into the quoin of the guard-room. Secondly, there was the hall door, which was the main entrance into the castle, consisting of an outer arch and an inner Pointed arched doorway. Thirdly, there was the haunted room, situated in the upper portion of the wing projecting from the round flagstaff tower. There it was said that Gerald, the eleventh Earl of Kildare, practised the Black Art, which earned for him the name of the "Wizard Earl." While it was gratifying to them to stand there on such historic ground and under the shadow of the venerable castle, it was doubly so when they found themselves the guests of the lineal descendants of the great family of the Geraldines and Fitzgeralds, and it added additional pleasure to the visit there since it was the house of one of the hon. secs., Lord Walter Fitzgerald, than whom in this country there was no more devoted student of archaeology.

A vote of thanks was passed to the Rev. Mr. Ganly.

The party was afterwards shown over the castle, where they were entertained to tea by the Ladies Fitzgerald.

TESSERÆ.

Egyptian Columns.

THE columns of the Egyptians are generally round in form up the greater part of the shaft; in general their width bears a much greater ratio to their height than in Grecian buildings, and this imparts to them a greater degree of heaviness. In some columns the surface is sculptured with representations of the lotus-leaf, in others it is made to appear like a bundle of rods fastened together by hoops, while others are diversified in form in various ways. It is supposed that one of these forms was intended to imitate the use of a number of Thebaic palm trees bound together to furnish a support. Some few pillars are of the same diameter all the way up. Square columns are found in the tombs, and others are found in some of the temples. Some of the square pillars exhibit caryatid figures on one of their sides, projecting more or less boldly from the face of the stone, and seeming to support a weight aloft. In the court of one temple there is a row of eight huge square pillars, measuring 8 feet in width on each face, and on one side of each pillar there is a caryatid figure standing on a pedestal of its own. The form of the capital of an Egyptian column, and the relation in size and appearance which it bears to the shaft, vary exceedingly. At Denderah the sculptured devices of the capital are exceedingly curious. In the majority of cases, however, the capitals are much more graceful. It has been remarked that the most common form of the capital is that of the calyx of a plant, probably that of the lotus, which in the religious system, as well as in the daily economy of the ancient Egyptians, was a most important element. This simple and graceful form has received, however, many modifications at the hands of the Egyptian mason, who appears not to have been at all deficient in taste in his selection of the natural models, nor in the power of adapting them to the purposes of architectural ornament. In other capitals the design has been probably taken from the gracefully hanging palm leaves, as they appear at the top of the trunk bending down on all sides. The general character of the capital is borrowed from the cup of a flower; in some cases the top or outer ring is exactly circular, in others the circle is broken into a number of curved lines with their convexities turned outwards, thus forming a series of beautifully bending petals. On the outer surface of these graceful bends various ornaments are cut encircling the whole capital. We have the bulrush, with its stem and leaves, and the palm-branch, with its leaves and fruit, and the calyx of the lotus-flower grouped with the leaves of the same plant, and the rounded tuft-like head of the palm before it is expanded in spring, and the lotus again, with its flower alternately in the bud and full bloom, and we also see the vine, with its shoots and leaves intermingled with those of the palm tree. The capital of some Egyptian columns appears like several small pillars or shafts grouped together so as to show only their outer surfaces, terminated at the top by an abacus or dé and at the bottom by something like the cup of a flower.

The Choragic Monument, Athens.

The wealthy Greeks were in the habit of giving theatrical or musical entertainments, in which the performers contended with each other for the prize of superior skill. When any one

was declared a victor it was customary to erect a monument to his honour, and such seems to have been the origin of the building sometimes called the Lantern of Demosthenes, the term "Choragic" having a meaning in relation to stage performances, and the person who gave the entertainment being called the Choragus. This one, erected to the honour of Lysicrates, is almost the only one now remaining; it was built about 330 years before Christ, and is regarded as one of the most exquisite remains of Greek art. The monument is a very small structure. There is first a square basement or pedestal, about 12 feet high by 10 in width on each of its faces; above this are three circular steps, and on the uppermost of these steps is the monument, a circular building 7 feet in diameter by about 11 in height. This building is constructed in a very singular manner. It is formed of six pieces of marble, convex on one surface and concave on the other, and forming each one-sixth part of a cylinder. They are built up edge to edge so as to form a perfect cylinder; but at the vertical lines of junction are introduced Corinthian columns, one-half of the substance of which projects beyond the circular wall. These columns support an architrave, which is formed of one single block of marble cut into the form of a ring; above this is a frieze, also formed from one single piece of marble; then comes a cornice, and the whole is surmounted with a *tholos* or roof, made from one piece of marble, which rests on the circular wall. The exterior of this roof is somewhat conical in form, but the interior is made more nearly dome-shaped. The building has no entrance, nor is there any admission of light to the interior, the structure having been merely a monument, to be viewed externally. The basement of this monument is eminently bold and simple, admirably proportioned to the rest of the structure, and harmonising perfectly with it. The columnar ordinance is the only perfect specimen of the style in existence of pure Greek origin, and it has never been surpassed, perhaps not equalled in beauty elsewhere. The most exquisite harmony reigns throughout its composition; it is simple without being poor, and rich without being meretricious; and the same applies to the superimposed tripod and its supports. The decorations of the various parts of this building are very beautiful. The wall is nearly plain till near the top, where there is a row of sculptured tripods surrounding the building. The columns, in respect to the fluting of the shaft, the mouldings of the base and the foliage of the capitals, are considered quite a model of this kind of architecture. The frieze is sculptured with figures, representing a mythological story. The cornice of the entablature is decorated with ornaments. The exterior of the marble roof is sculptured to represent a thatch or covering of laurel leaves, and from the centre of it rises a small flower on which formerly stood a tripod.

The Costume and Weapons of the Phigaleian Frieze.

The dress of the Athenians, with whom the Amazons are engaged in combat, consists of a kind of cloak or robe, which covers the left shoulder, leaving the right bare; it is fastened round the waist by a belt, and reaches no lower than the knee. In many instances this robe is nearly disengaged from the body, being either simply secured round the neck by a fibula, or thrown loosely over the left arm. The offensive weapons of the Athenians appear to be swords, except in the particular case of Theseus, who, as the avowed imitator of Hercules, is properly represented fighting with a club, and bearing on his arm the skin of a lion instead of a shield. Their defensive armour consists of helmets and shields. The latter are large and circular, with a broad border round the circumference. They resemble in form the shield on which the names of the Ephebi of Athens are engraved. Of the helmets there are four kinds: one which fits the head closely, without either visor or crest; another, which differs from the former only in having a crest; a third, with a long pointed visor; and a fourth, of an oval form, with flaps descending on each side of the face, for the protection of the cheeks and ears. A remarkable diversity is apparent in the dresses of the Amazons. Sometimes they are represented in long tunics reaching to the ground, sometimes in a short vest reaching only to the knees; and in one of the bas-reliefs an equestrian Amazon has her arms covered with long sleeves, and her lower limbs clothed with a kind of trousers, all which dresses, as we know from the testimony of ancient authors, were in use among the Amazons. In some instances their heads are without any covering, while in others they are defended by a close helmet. One of these females has her hair fastened up by a knot at the top of her head. Their legs, with only one exception, are invariably protected by boots, which reach up nearly to the knees. Their robes are uniformly fastened round their waists by a zone, and they have often one or two belts passing over the shoulders and crossing in front between the breasts. It is to be regretted that none of the offensive arms with which the Amazons fought are here preserved; but we perfectly know that they assailed their enemies with swords and battle-axes in close combat, and that

they annoyed them at a distance with spears and bows and arrows. In the Phigaleian frieze they are represented as using the two former weapons only. The use of the sword is, indeed, clearly determined by the circumstance of a scabbard being fastened to the belt of one of the Amazons, and by the hilts which are left in the hands of some of the figures; and we may reasonably conclude, from the action of a few other figures, that they also fought with the battle-axe. But the almost total loss of the weapons used by the combatants in this frieze renders it extremely probable that they were for the most part executed in bronze, the holes into which they were inserted being still visible in many places. The Amazonian shields are rather larger than usual on these bas-reliefs; they are of an oval shape, and a semicircular piece has been cut out at the edge of the upper part, probably for the purpose of furnishing a loophole through which they might watch the motions of their enemy. These shields were called *pelta*, and from the semicircular piece cut out at the edge, they are frequently described as having the form of a half-moon. The Amazons are said to have been very skilful in the management of horses. They are here sometimes represented fighting on horseback, though more frequently on foot.

Early Renaissance.

Like the Rounded architecture, the Pointed was fated only to have its day. After it had throughout all Europe superseded that Rounded style with most extraordinary rapidity, it was itself again in its turn throughout all Europe rejected and displaced by an external and superficial return to those forms and principles of the ancient Greek and Roman style which had preceded both, and the change was equally rapid and universal. Architects, while the finest antique monuments yet subsisting stared them in the face and gave them constant ocular evidence of their superior beauty, had every day more widely deviated from those forms and principles, till at last their productions retained not the least similitude to those of the ancients, out of which they might be said to have grown. Just when they had arrived at the utmost pitch of their dissimilitude and when those splendid relics of antiquity that might, it should seem, have restrained or recalled them from their aberrations, had almost all disappeared from the surface of the earth, they were suddenly seen to leap backwards across all the intervening centuries of slow and gradual development of the Pointed and of the Rounded style that had preceded it in order to revive in name and pretension, if not in reality, in their new fabrics, the forms and features of those antique monuments destroyed. They again abandoned that complicated arch, that expanding buttress, which had become features so prominent in every edifice, for the simple coved ceiling, a transverse cincture and upright support; they again set aside every species of tracery and tabernacle work, of cusp, and canopy, and crocket and other ornaments peculiar to the Pointed style, for the capital, cornice, entablature, balustrade and vase of the ancients; they even abased all these deviations from the antique, which they had erst so much admired, and they called their proceeding a revival of ancient taste. The term "revival" can hardly with strict propriety be applied to such an event, since a revival can only take place in that identical body in which that peculiar mode of life existed before. The ancient Classical forms had existed in Greece, whereas the renewed form sprang up in Italy. However much the change might have displayed an unqualified abandonment of the Pointed style with all its peculiar merits as well as blemishes, it was only an external resumption of certain antique forms jumbled together without regard to their nature or destination, and by no means a uniform and universal and consistent return to the very essence of antique taste and principle.

German Churches.

The great impression which the German churches, particularly the interiors, make upon the mind of every unprejudiced person, on that of the intelligent and well-informed as well as that of the uncultivated and ignorant, is truly wonderful; they combine the simplicity and majesty of the groves of the forest with the richness and beauty of its flowers and leaves; all is variety, greatness and sublimity. The golden age of this style continued from the middle of the thirteenth to the latter end of the fourteenth century. The desire to produce something new and still more beautiful, as it had caused the decline of the ancient Roman, and afterwards, in the seventeenth century, that of the Italian style of architecture, occasioned likewise the decay of the German style of church building. To a severe regularity of forms succeeded arbitrary petty decorations, and whereas the best examples of the thirteenth century are ornamented with fruit and flowers, the edifices of the fifteenth were themselves in the form of plants, a freak which seems to overstep the bounds of architecture. This style of building, having outlived its prosperity, was the more easily superseded in the sixteenth century by a more modern Italian style.

NOTES AND COMMENTS.

If we may judge from the "Calendar of the Glasgow and West of Scotland Technical College," Glasgow, it is more fortunate than the rest of Great Britain in its facilities for technical training. A student who is eager to gain knowledge will find there is as much of all kinds available for him within the city as the most ambitious can desire. This mainly arises from the excellent spirit in which education is controlled in Scotland. Classes in the Glasgow University can be entered without difficulty by an operative or an apprentice, and he will there become acquainted with all that science can teach about his calling. The English universities and higher colleges occasionally condescend to do something of the kind, but in a perfunctory sort of way. It is only, as it were, the superfluous scraps which are bestowed. This example is imitated in so-called technical colleges, and, as in the very big and very desolate one belonging to the City and Guilds at South Kensington, there is welcome only for those who are known to be wealthy. The sons of manufacturers are taught by means of funds that were supplied by benevolent people, in the expectation that they were to be employed for the benefit of students who could not obtain technical education without that sort of help. The technical college of Glasgow is made up of a series of institutions in which classes are so arranged that the skill of an immense number of able professors can be utilised by a student on most economical terms. A boy of ten will find the way has been prepared for him and he can follow it constantly or occasionally as most convenient to himself, until he becomes a Doctor of Science. Those who are compelled to make only short journeys will find everything made easy for them. Students of mechanical engineering, naval architecture, electrical engineering, architecture, building construction, mining, metallurgy, agriculture, art industries, chemical industries, textile industries, or commerce, who have only evening hours at their disposal, can satisfy themselves that a systematic education awaits them, with the use of laboratories, workshops and appliances. During the last session we see that 72 architects and measurers, 276 plumbers, 78 painters, 91 joiners, 24 masons and bricklayers, 88 chemists, 100 electrical engineers, 8 blacksmiths, 11 iron-moulders and representatives of an immense number of other industries attended the evening classes. The numbers under instruction given in the day is also most remarkable. The advantage of the system is shown by the list of appointments held by former students of the college, for usefulness in business should be the aim of technical training. The result shows that Glasgow flourishes in education as well as in many other affairs.

ABOUT 500 workmen are now engaged on [the great dome of the new Basilica at Montmartre. As is generally the case, the exterior and interior parts will not correspond in contour. The inner dome will be about 165 feet from the pavement of the church; the outer will be 276 feet. A staircase will be constructed in the intervening space. The great dome will probably be finished before the end of next year. The four smaller domes will then be undertaken. The campanile, which will be over 400 feet in height, will not be completed until the year following. The group of buildings will then dominate Paris and the surrounding district. The fifteen side-chapels are now ready to be employed for service. The crypt, with its seven chapels, may also be considered as completed. The interior decoration will soon have to be considered, and owing to the severe character of the building it will be a problem not easily solved. The expenditure on the basilica has been enormous, and yet at no time was money wanting. The French are generally not liberal in paying for church building, but in 1873 the funds for the Montmartre church amounted to 600,000 francs, and in twenty-one years the subscriptions came in so liberally that up to the end of last July the total receipts reached 27,594,713 francs, and there is no sign of cessation.

AMONG the archaeological explorers of the century there is not one who merited more honours than the late JEAN BAPTISTE DE ROSSI, who has died on the 20th inst. in the

papal palace of Castel Gandolfo. He attained his seventy-second year. In an age like ours the Catacombs, which he admired beyond all things in that Subterranean Rome of which he wrote, are not esteemed like the ancient city at Hissarlik or the tombs beneath the Egyptian sands. But it was Rossi who was the pioneer in Rome in that sort of exploration by which ancient life becomes reanimated, and which has been so successful in many other places. The Museum of Christian Antiquities, which he organised in the Lateran, is one of the most remarkable in the world, if judged by its value as historical evidence. Every modern explorer of the Catacombs has endeavoured to obtain Rossi's authority as a support of his conclusions. Before the "Roma Sotterranea" had established Rossi's fame he was known among foreign archaeologists for his essays on inscriptions, mosaics, &c., and he wrote also on the family of artists known as the COSMATI, LEON BAPTISTA ALBERTI and others. He retained his office as Conservator in the Lateran, and many of our readers will be able to recall his genial eloquence whenever he was consulted about any of his beloved antiques.

THE origin of photography is a disputed question. A paper describing DAGUERRE'S invention, read before the French Academy of Science in January 1839, was long supposed to be the earliest historical record of the process. Afterwards claims were set up on behalf of JOSIAH WEDGWOOD, the potter, and others. In Vienna there is a society which takes great interest in the question. Herr EDER, one of the directors, considers that the earliest operator was a German physician, JOHANN HEINRICH SCHULZE, who was born on May 12, 1687, and was afterwards Professor of Medicine in Halle. In 1727 he was making experiments in which phosphorus, chalk, aquafortis and silver were employed, and on bringing some of the substance to which they were applied for examination to a window, he perceived that parts became sensibly darkened, and on continuing the experiments discovered the sensitiveness to light as a property of salts of silver. He was also able to utilise his discovery in copying manuscripts. It appears there is an early account of the process, which has not received much attention.

A CLIQUE may year after year prevent M. BENJAMIN CONSTANT from obtaining that Médaille d'Honneur which his paintings have won in the Salon. But his countrymen do not less esteem him on that account. They are sure, therefore, to give attention to his proposal concerning the old Roman theatre at Orange. There is nothing M. BENJAMIN CONSTANT loves better to paint than the occupants of a Byzantine or other ancient throne, with the fiercest light upon them, which will make their diadems, jewels and robes, and all the splendour around them appear in full brilliancy. But nobody can be more appreciative of old COROT when he said, "As soon as the dawn gives place to the day I shut up my paint-box and depart, for the mystery which is everything has disappeared and there is nothing more for me to paint." M. BENJAMIN CONSTANT desires that the words should be accepted as a principle by the director of the Comédie Française whenever he undertakes a performance of the ancient drama on the Orange stage. He would desire to see the theatre restored to its pristine magnificence, with its porphyry columns and statues of bronze, but that day is far off. But meanwhile he considers a glorious effect could be gained if the ruined theatre could be only dimly and mysteriously lighted. At the present time, when colour-effects by arrangement of lamps are so easily produced with the aid of electricity, the attempt would involve little trouble. In that way there would be a contrast offered which would make the revivals become unlike those of ordinary theatres, and the actors would attain a shadowy appearance that would be adapted to the occasion. Instead of ordinary men and women it would be easy for the spectators to imagine that the epic characters of the ancient dramatists were before them, once more compelled by Destiny to suffer in order that Justice might be asserted. To experience the emotions which would then arise would repay the longest journey, the most toilsome journey to Orange.

The Architect, Sept. 28th 1894.

ILLUSTRATIONS.

P. & O. COMPANY'S NEW OFFICES, LEADENHALL STREET, LONDON, E.C.

THIS illustration shows the building without however the sculptured panels, which enhance the effect.

HILL WOOTTON, WARWICKSHIRE.

THIS little Warwickshire house and stabling cost only some 1,500*l.*, including boundary walls—the house itself only 1,000*l.* The principal rooms have been treated with painted panelling, and the house throughout has been treated with the utmost care. A view from the stable yard was exhibited in this year's Royal Academy. Mr. P. MORLEY HORDER is the architect.

NEW MUSIC-ROOM, 140 HARLEY STREET.

THIS is an illustration of a cleverly-treated music-room, intended to be an adjunct to an old house in Harley Street, W., approached from the first half landing of the main staircase and through a small winter garden. The walls to be lined with polished wainscot panelling, slightly fumigated. The drawing has been lent to us by the architect, Mr. H. HUNTLY-GORDON, A.R.I.B.A., 123 Cannon Street.

NEW PREMISES ON THE MYDDELTON HALL ESTATE, ISLINGTON, N.

WE publish to-day the illustration of a building which has been erected at the corner of Upper Street and Almeida Street, Islington. It forms the corner feature of a large block of premises, recently erected by Mr. H. HUNTLY-GORDON, of 123 Cannon Street, for Mr. HARRY LAWRENCE.

The site was formerly occupied by the house of Sir HUGH MYDDELTON, the founder of the New River Water Company, but it has now been divided into two portions, shop premises having been built on the portion fronting Upper Street and public assembly rooms and a concert hall have been built at the rear, with entrances and exits in Almeida Street. The plans of the front portion have been arranged so that the upper portion can be let separately.

The façades are built entirely of pinky-red terra-cotta made by Mr. J. C. EDWARDS, of Ruabon, and the joinery is of walnut. The modelling of the terra-cotta was executed by Mr. GILBERT SEALE.

The contractors for the foundations and work up to the pavement-level were Messrs. PATMAN & FOTHERINGHAM, but the superstructure and internal fittings and finishings were carried out by Messrs. F. & H. F. HIGGS, of Loughborough Junction.

ENGLISH CHANTRIES.

IN the most interesting volume on "St. Paul's Cathedral and Old City Life," by Dr. W. Sparrow Simpson, the sub-dean, there is a chapter on the chantry priests, based on statutes compiled by Dean Colet. It appears the Cathedral was "unusually rich in obits and in chantries." A list which exists and which is supposed to have been prepared in the fourteenth century, mentions seventy-three chantries. In the first year of Edward VI. there were thirty-six chantries, if groups are reckoned as one, or fifty-three if each be separately counted. Princes and persons of great wealth, when they founded monasteries, included amongst the duties of the religious for whose use they gave them, that they should for ever make mention of the donors in their daily services. When the taste for founding monasteries declined, which may be referred to about the close of the twelfth century, the disposition to secure the same object, by the foundation of chantries, began to prevail extensively in the better classes of society, and it continued with unabated zeal to the very eve of the Reformation.

A chantry did not necessarily require that any edifice should be erected for it. Chantries were usually founded in churches already existing, sometimes the churches of the monasteries, sometimes the great cathedral or conventual churches, but very frequently the common parish church, whether in a town or in a rural district. All that was wanted was an altar with a little area before it and a few appendages, and places were easily found in churches of even small dimensions in which such an

altar could be raised without interfering inconveniently with the more public and general purposes for which the churches were erected. An attentive observation of the fabric of the parish churches of England will often detect where these chantries have been, in some small remains perhaps of the altar, which was removed at the Reformation, but more frequently in one of the niches which were in proximity with the altars. Sometimes there are remains of painted-glass, which it is easy to see has once been the ornament of one of these private foundations, and more frequently one of those arched recesses in the wall which are called founders' tombs, and which in many instances no doubt were actually the tombs of many persons to whose memory chantries had been instituted.

In churches which consisted of only nave and chancel with side aisles, the eastern extremities of the north and south aisles were often seized upon for the purpose of these foundations; in the larger churches, having the platform resembling the cross on which the Saviour suffered, the transverse beams were generally devoted to the purpose of these private foundations. In the great conventual churches of monasteries, it would appear as if provision were often made for these private chantries in the original construction, each window that looks eastward being often made to light a small apartment just sufficient to contain an altar and a little space for the officiating priest.

It was by no means unusual to have four, five, or six different chantries in a common parish church. When the fabric of a church afforded of itself no more space for the introduction of chantries, it was usual for the founders to attach little chapels to the edifice. It is these chantry chapels, the use and occasion of which are now so generally forgotten, which occasion so much of the irregularity of design which is apparent in the parish churches of England. Erected also as they generally were in the style of architecture which prevailed at the time, and not in accommodation to the style in which the original fabric was built, they are a principal cause of that want of congruity which is perceived in the architecture of different parts of the parish churches.

When chapels were erected for the especial purpose of the chantries, they were usually also the places of interment of the founder and his family, whence we sometimes find such chapels belonging, even to this day, to particular families, and adorned with monuments of many generations. One of the most beautiful chapels of this kind is in the little village of Sandal, a few miles from Doncaster, the foundation of Rokeby, archbishop of Dublin, who died in 1521. The church of Sandal being small afforded no scope for the design of this magnificent prelate. Having therefore determined that here should be the place of his interment and the perpetual celebrations in his memory, he erected a chapel on the north side of the choir, open, however, to the church on one side, being separated from it only by open wainscot. On entering it by the door one sees at once the whole economy of one of these chapels. Under the window looking eastward an altar has stood; the piscina on the right remains. On each side of the east window is a niche where once, no doubt, stood an effigy of a saint whom the archbishop held in peculiar honour. In the centre is a brass indicating the spot in which the body of the prelate lies; and in the north wall is a memorial of him, having his arms and effigies, with an inscription setting forth his name and rank and the day of his decease, with divers holy ejaculations. The stone and woodwork have been wrought with exquisite care, and the windows appear to have been all of painted-glass.

Sometimes chantries were established in edifices remote from any church, a chapel being erected for the express purpose.

In chantries of royal foundation, or in chantries founded by the more eminent prelates or barons, the service was conducted sometimes by more than one person. But usually there was but one officiating priest. The foundation deeds generally contain a distinct specification of his duties, which consisted for the most part in the repetition of certain masses, but sometimes the instruction of youth and the delivering pious discourses to the people made part of the duty of the chantry priests. They also contain an account of the land settled by the founder for the support of the priest. The names of the persons whom he was especially to name in his services are set forth, as well as the mode of his appointment and the circumstances in which he might be removed. Generally the king was named together with the founder and members of his family. This, it was supposed, gave an additional chance of the foundation being perpetuated. The king's license was generally obtained for the foundation.

In many towns and country places there are ancient houses known by the name of chantry houses, or sometimes chantries or colleges. These have been places of residence of the chantry priests, and were called colleges, a considerable number of them being in one church, where they lived a kind of collegiate life, it being held that the clergy should mix but little with the laity. These, as well as all other property given for the support of the chantry priests, were seized by the Crown.

and sold to private persons, when by an Act passed in the first year of King Edward VI., c. 14, all foundations of this kind were absolutely suppressed and their revenues given to the king.

VALUATION OF LANDED AND HOUSE PROPERTY.

THE following evidence was given by Mr. Robert Vigers before the select committee of the House of Lords on Town Improvements (Betterment), and explains the method usually adopted by skilled experts for arriving at the value of property in this country :—

Lord Thring.

All valuation of land, I presume, is a very difficult business, is it not?—Well, it requires great practice; a man cannot do it unless he is constantly at it.

In very many cases it is a matter of guesswork to a great extent, is it not?—I should imagine a great deal of it is guesswork when we find of late years barristers have taken to valuing land for clearing sites for workmen's dwellings; I should think there must be a great deal of guesswork about that.

I am not asking about such cases as that, but with a man as expert as yourself, do you not often have to guess at the value?—I do not think so. I judge from general experience.

Then you, as an expert, have no great difficulty in valuing any property?—Yes, we have great difficulty in valuing at times.

But you do it?—Yes, we do it. In making a valuation simply for a man to purchase or sell property, I should guard myself, and say, That is the value to the best of my opinion, but it may be worth more, or it may be worth less.

Still, like all human affairs, I presume your client acts upon your judgment, and sells his house at a greater or less price, according as you tell him it is more or less valuable?—At times, yes; but mostly you find that a man asks you your opinion, and then acts upon his own judgment.

Marquis of Salisbury.

His judgment, whatever it is, is controlled by the judgment of the other party to the transaction, if there is anything unreasonable in it?—Yes.

Which is not the case in an arbitration?—Certainly not.

Lord Farrer.

You have spoken as if the future were an extremely difficult element to take into consideration in fixing the value of land?—Yes.

You are guided generally by the price that is actually given?—Yes, by the times' price.

In fact, there is no such thing as a scientific basis of valuation, except experience?—Not that I know of.

What the property is ordinarily sold for?—Yes, what it might be fairly worth.

I want to ask you this. In putting a value upon land for a person who is going to sell to the London County Council, are you guided solely by what the land or houses in that street or place have been sold for, or are you guided by what they are likely to be sold for. Is it the future value or the past value that you have regard to?—The present value.

What is the present value founded upon?—It depends upon what the object is. If you are valuing a property that has only a ground-rent, we will say, and a reversionary value, you value the ground-rent upon the 3 or 4 or 5 per cent. tables, as it may be, for the term of the lease to run. Then you have got something beyond that in the reversion. The only way to arrive at the value of the reversion is to take the present rental value of the property and defer that for the number of years that the lease has to run. It is impossible for you to tell what the value of the property is going to be at the end of the lease that has got to run. The man who carries out that practice, as we are taught, always bases the value of a reversion upon the value of to-day.

Are there not properties which are increasing in value, and are there not properties which are diminishing in value?—Yes.

Do you value both upon the mere present rental?—It is impossible to say whether property twenty years hence is going to be of less or greater value, and a man is satisfied to buy it upon the present day's value.

Is that the way in which in ordinary purchases or sales of things producing a value their value is calculated?—According to my experience, yes.

Always upon the present rental?—Upon the present value; not the present rental always, but the present value.

Upon what is that present value founded? In selling or purchasing any investment you like to take, is not the value founded upon what you expect the thing to produce?—Upon what it is producing to-day.

Is that all?—That is all. One cannot tell what it will produce twenty or thirty or forty years hence.

Do you assume in all these cases that the same property will produce exactly the same thing twenty or forty years hence that it will produce to-day?—I know of no other way of valuing property.

Is that the way you value all property, for instance, investments?—Yes.

Lord Thring.

If I ask you to value a house in the country and I show you that a beautiful view is going to be opened up by a particular improvement that is going to be made, do you mean to tell me you would not take that improvement into consideration in valuing the house?—If you were to tell me it was going to be made I should consider that.

Is not that a future thing?—I do not know about that; I think it is present.

That is practically what Lord Farrer was putting to you.—If you were to tell me that possibly twenty or thirty years hence a beautiful view may be opened I could not tell.

Neither Lord Farrer nor myself asked you about twenty years hence. What we ask is this: when you are valuing a house in town or in the country, or when you are valuing land anywhere, and sufficient evidence to reasonably satisfy a man of common sense is given that some event or contingency has occurred which will make that land more valuable, would you value it having regard to that contingency or event?—I value it at what it is worth that day. That is exactly what I tell you.

I ask you whether, supposing there is sufficient evidence to satisfy a reasonable man that there will be an improvement made in the surroundings of that house or in the use of the land, or anything else you like, by some immediate probable event, you do not take that immediate probable event into your consideration in valuing the then present value?—I say yes; I take it and base it upon its rental value to-day, and if you tell me the improvement is made to-day and absolutely existing, I can see what that improvement is worth. It may be worth something or it may be worth nothing. If it is worth something I should add it in.

You have to add it to the present rental value?—That is what I am saying. It is the present rental to-day you base your reversionary value upon.

Then it is only a quibble about words if you like to call that the "present rental value." I thought what you meant by "present rental value" was the present rent?—No. I am sorry your lordship should think I am quibbling about words; I am not in the habit of doing so.

What is the difference between "present rental value" and the present rent?—The difference is very great.

Will you explain what it is?—The "present rent" is what the property is at present let at, the "present rental value" is the value it may be worth.

Earl Cowper.

Have you had to value a great many properties which were improving, and in which you had to look forward to the future as an element in the valuation?—I have had to value properties of all classes.

Very often, and indeed generally, there are two valuers, one for the purchaser and one for the seller, and an arbitrator is called in; that is very often the case, is it not?—Yes.

In the case of improving properties in which the price has to be settled with a view to what would be the value in a certain number of years, is there much difference between the values as fixed by the valuer for the purchaser and the valuer for the seller, and is the whole thing more uncertain than when you are merely valuing property that is stationary?—I find that difference in valuation depends upon the men you meet more than anything else. Some men have very inflated ideas of what property is going to be worth, and that is where you come into difficulties in making settlements.

It depends upon the specific valuer whether he takes a hopeful view of the future or the contrary?—Yes, certainly; there is a very great difference sometimes.

In valuing for the future there is much more discrepancy between the judgments of different men than when you are valuing property where no changes are anticipated?—Yes, I should think so.

It is a very uncertain thing valuing for the future?—Yes, very uncertain; especially with some men whom one has to meet.

Lord Belper.

I wish to ask you one question with regard to the figures you gave us. I understood those figures were based upon the present rateable values compared with the rateable values a certain number of years ago?—Yes.

I think you added that in your opinion the authorities who made those assessments were neither very active nor very accurate?—In many parishes I should say that is so.

Therefore the value of those figures is so far discounted by their want of accuracy?—Yes; I mentioned it simply because I think that either those figures I have given you or those given

by Mr. Dickinson should be relied upon very little as a guide as to what improvement had taken place.

You do not give them us for the purpose of relying upon them in judging whether the values of the properties had actually increased or not, but as showing that there might be considerable difference in regard to whether they had increased or not?—Yes.

I wish to ask upon what general principles you would go when you are valuing property for rating purposes; would the principle you spoke of as applicable to purchase and sale apply to rating purposes also, as a general rule?—For rating purposes we have to fix the price that it is reasonable to suppose a tenant would pay for the occupation of the premises from year to year.

WALL-THICKNESS UNDER THE BUILDING ACT, 1894.

APPENDED to the new London Building Act are the usual schedules about the construction of walls. We have tabulated the prescriptions in Parts I. and II. about the thickness of external and party walls, for the sake of convenience when they are employed:—

Parts I. and II. of this schedule apply to walls built of bricks not of less than $8\frac{1}{2}$ inches long, or of stone or other blocks of hard and incombustible substance, the beds or courses being horizontal.

1. Every building unless otherwise sanctioned in accordance with this Act shall be enclosed with walls constructed of brick, stone, or other hard and incombustible substances, and the footings shall rest on the solid ground or upon concrete or upon other solid substructure. Provided that open sheds not exceeding 16 feet in height and not exceeding four squares in area may be constructed of any substances and in any manner approved by the district surveyor.

2. Every wall constructed of brick, stone, or other similar substances, shall be properly bonded and solidly put together with mortar or cement, and no part of such wall shall overhang any part underneath it except to the extent of 6 inches, and provided that the projection be well and solidly corbelled out and that the side of the wall opposite to the corbelling be carried up vertically in continuation of the inner face thereof. And all return walls shall be properly bonded together.

3. The thickness of every wall not being built of bricks or stone or other hard and incombustible substances laid in horizontal beds or courses shall be one-third greater than the thickness prescribed in Parts I. and II. of this schedule.

4. The thickness of any wall of a dwelling-house if built of materials other than those before specified shall be deemed to be sufficient if made of the thickness required by Parts I. and II. of this schedule, or of such thickness as may be approved by the Council.

5. When hollow walls are constructed there shall be a wall on one side of the hollow space of the full thickness prescribed by this Act.

6. The height of storeys shall be measured as follows:—
(a) The height of a topmost storey shall be measured from the level of the underside of its floor joists up to the level of the under surface of the tie of the roof or other covering, or if there is no tie, then up to the level of half the vertical height of the rafters or other support of the roof; (b) the height of every storey other than a topmost storey shall be measured from the level of the underside of the floor joists of the storey up to the level of the underside of the floor joists of the storey next above it.

7. For the purpose of determining the thickness of a wall the height of such wall shall be measured from the base of the wall to the top of the topmost storey whether such wall is carried to the full height or not, or in case of a gable when there are no storeys in the roof to half the height of the gable.

8. Walls are deemed to be divided into distinct lengths by return walls and the length of every wall is measured from the centre of one return wall to the centre of another, provided that such return walls are external party or cross walls of the thickness required under this schedule and bonded into the walls so deemed to be divided.

9. Unless with the consent of the Council every wall other than a wall carried on a bressummer shall have footings.

The projection of the bottom of the footing of every wall on each side of the wall shall be at least equal to one-half of the wall at its base unless an adjoining wall interferes, in which case the projection may be omitted where that wall adjoins, and the diminution of the footing of every wall shall be formed in regular offsets, and the height from the bottom of such footing to the base of the wall shall be at the least equal to two-thirds of the thickness of the wall at its base.

10. The underpinning of walls and chimneys shall be built with brick or stone bedded in cement to the full thickness of the old wall or work, and with proper footings, or to an additional thickness if the increased height of the wall so re-

quires, and shall rest on solid ground or on concrete or on other solid substructure as a foundation, and the whole shall be executed to the satisfaction of the district surveyor.

11. A wall shall not be thickened except after notice served on the district surveyor of the intention to thicken, and the thickening shall be executed with brick or stone-work in cement properly bonded to the old work, to the satisfaction of the district surveyor.

THICKNESS OF EXTERNAL AND PARTY WALLS.

Part I.—Building not Public and not of the Warehouse Class.

Height, not exceeding	Length of Walls.			
	Not exceeding 30 feet.	Not exceeding 35 feet.	Not exceeding 45 feet.	Exceeding 45 feet.
25 feet	$8\frac{1}{2}$ in. throughout (if not more than two storeys) Exceeding 30 feet, $8\frac{1}{2}$ in. rest of height 13 in. below top-most storey	—	—	—
40 feet	—	$8\frac{1}{2}$ in. rest of height 13 in. below top-most storey Exceeding 35 feet, $8\frac{1}{2}$ in. rest of height 13 in. below top-most storey 17½ in. one storey	—	—
50 feet	Not exceeding 30 feet. $8\frac{1}{2}$ in. rest of height 13 in. below top-most storey 17½ in. one storey	—	13 in. rest of height 17½ in. two storeys	13 in. rest of height 17½ in. one storey 21½ in. one storey
60 feet	—	—	13 in. rest of height 17½ in. two storeys	13 in. rest of height 17½ in. two storeys 21½ in. one storey
70 feet	—	—	13 in. rest of height 17½ in. two storeys 21½ in. one storey	To be increased in each storey below uppermost two storeys by 4½ in.
80 feet	—	—	13 in. rest of height 17½ in. three storeys 21½ in. one storey	Ditto
90 feet	—	—	13 in. rest of height 17½ in. three storeys 21½ in. one storey 26 in. one storey	Ditto
100 feet	—	—	13 in. rest of height 17½ in. three storeys 21½ in. two storeys 26 in. one storey	Ditto
120 feet	—	—	13 in. rest of height 17½ in. three storeys 21½ in. two storeys 26 in. two storeys 30 in. one storey	Ditto

If any storey exceeds in height sixteen times the thickness prescribed under this schedule for walls of such storey, the thickness of each external and party wall throughout such storey shall be increased to one-sixteenth part of the height of the storey, and the thickness of each external and party wall below that storey shall be increased to a like extent, but any such additional thickness may be confined to piers properly distributed, of which the collective widths amount to one-fourth part of the length of the wall.

No storey enclosed with walls less than 13 inches in thickness shall be more than 10 feet in height between the floor and the ceiling thereof or between the floor and the tie of the roof.

All buildings excepting public buildings and such buildings as are in this Act defined to be buildings of the warehouse class shall, as respects the thickness of their walls, be subject to the provisions contained in this part of this schedule :—

Part II.—Buildings of the Warehouse Class.

Height, not exceeding	Thickness at Base.			Exceeding 45 feet.
	Not exceeding 30 feet.	Not exceeding 35 feet.	Not exceeding 45 feet.	
25 feet	13 in. (unlimited).	—	—	—
30 feet	—	—	13 in.	17½ in.
40 feet	—	13 in.	17½ in.	21 in.
50 feet	17½ in.	—	21½ in.	26 in.
60 feet	—	—	21½ in.	26 in.
70 feet	—	—	21½ in.	Increased in thickness from base to within 16 feet from top by 4½ ins.
80 feet	—	—	21½ in.	Ditto
90 feet	—	—	26 in.	Ditto
100 feet	—	—	25 in.	Ditto
120 feet	—	—	31 in.	Ditto

The thickness of the wall at the top and for 16 feet below the top shall be 13½ inches, and the intermediate parts of the wall between the base and 16 feet below the top shall not be of less thickness than would be the case if the wall were to be built solid throughout the space between straight lines drawn on each side of the wall, and joining the thickness at the base to the thickness at 16 feet below the top.

Nevertheless, in walls not exceeding 30 feet in height the walls of the topmost storey may be 9 inches thick provided the height of that storey does not exceed 10 feet.

If in any storey of a building of the warehouse class the thickness of the wall as determined by the provisions of this schedule is less than one-fourteenth part of the height of such storey, the thickness of the wall shall be increased to one-fourteenth part of the height of the storey, and the thickness of each external and party wall below that storey shall be increased to a like extent, but any such additional thickness may be confined to piers properly distributed of which the collective widths amount to one-fourth part of the length of the wall.

The thickness of any wall of a building of the warehouse class, if built of materials other than those before specified, shall be deemed to be sufficient if made of the thickness required by the provisions of this schedule, or of such other thickness as may be approved by the Council.

Miscellaneous.

The thickness of a cross wall shall be two-thirds of the thickness hereinbefore required for an external or party wall of the same dimensions and belonging to the same class of buildings, but never less than 8½ inches, and no wall subdividing any building shall be deemed to be a cross wall unless it is carried up to the floor of the topmost storey, and unless in each storey the aggregate extent of the vertical faces or elevations of all the recesses, and that of all the openings therein taken together, does not exceed one-half of the vertical face or elevation of the wall.

Wherever a cross wall becomes in any part an external wall, such cross wall shall be of the thickness required for an external wall of the same height and length and belonging to the same class of buildings.

Where an increase of thickness is by any rule of Part I. or Part II. of this schedule required in case of a wall exceeding 60 feet in height and 45 feet in length, or in case of a storey exceeding in height sixteen times or fourteen times (as the case may be) the thickness prescribed for its walls, or in case of a wall below such storey, the increased thickness may be confined to piers properly distributed, of which the collective widths amount to one-fourth part the length of the wall.

Fire-resisting Materials.

The following materials are for the purposes of the London Building Act deemed to be fire-resisting materials :—

(1) Brickwork constructed of good bricks, well burnt, hard

and sound, properly bonded and solidly put together (a) with good mortar compounded of good lime and sharp, clean sand, hard clean broken brick, broken flint grit or slag, or (b) with good cement, or (c) with cement mixed with sharp, clean sand, hard clean broken brick, broken flint grit or slag; (2) granite and other stone suitable for building purposes by reason of its solidity and durability; (3) iron, steel and copper; (4) oak and teak and other hard timber when used for beams or posts or in combination with iron, the timber and the iron, if any, being protected by plastering in cement or other incombustible or non-conducting external coating. In the case of doors, oak or teak or other hard timber not less than 2 inches thick. In the case of staircases, oak or teak or other hard timber, with treads, strings and risers not less than 2 inches thick; (5) slate tiles, brick and terra-cotta when used for coverings or corbels; (6) flagstones when used for floors over arches, but not exposed on the underside and not supported at the ends only; (7) concrete composed of broken brick, stone chippings or ballast, and lime cement or calcined gypsum when used for filling in between joists of floors; (8) any material from time to time approved by the Council as fire-resisting.

POMPEII.

THE Naples correspondent of the *Daily News* in a recent letter asks how many people, when they visit Pompeii, remember anything of what has been learnt out of its early history? To know something of it adds so much to the interest with which the dead city is contemplated that every one must feel grateful to Professor Man for having prefaced his most admirable "Führer durch Pompeii," quite lately published under the auspices of the German Archæological Institute in Rome, with a readable brief introduction. As the guide is not to be published in England until two or three years are passed, I will here give a sketch of what Professor Man, the greatest living authority on Pompeii, tells us about its history.

The city of Pompeii already existed in the sixth century B.C., as is proved by the remains of its oldest public building, the Doric Temple. But the date of the first foundation of the city is quite unknown. It was first inhabited by the Oscans, a race whose language is imperfectly known through some inscriptions. The name of Pompeii is derived from a word belonging to this ancient language, the word "pompe," or "five." The city was wrested from its original inhabitants by the Samnites when they advanced from the mountains to the coast in about the year 420 B.C. The Oscans and Samnites together, under the influence of the neighbouring Greek colonies, developed a civilisation probably far outstripping that of the contemporary Romans. In the years 342 B.C. and 290 B.C. the Samnite wars led to the subjection of Pompeii by Rome. The city was drawn into the Roman confederacy, during which it preserved its independence as to its home affairs. It was only in the year 80 B.C., when the Samnites were conquered by Rome, that Pompeii became Romanised by a colony of veterans under P. Sulla, a nephew of the then Dictator. The city was presently named Colonia Cornelia Veneria Pompeianorum, after the family name of the Dictator Sulla and the goddess of whom he was a special devotee, and who then became, as the Venus Pompeiana, the tutelary divinity of the city. At the same time a suburb was founded, probably by the citizens who had been driven out in favour of the Roman veterans, which was named Pagus Felix, after the by-name of the Dictator, and later, in honour of Augustus, Pagus Augustus Felix. The inscriptions which have been found at Pompeii show that many state offices existed in pre-Roman times. There was a Kombennion, National Assembly or Senate, it is not known which; a Medix or Medix Tutix, the chief of the city; a Koaisstur, or Quæstor, who was probably entrusted with the city treasury; and two aediles, ædiles, employed in the making of roads. Under the Romans, after 80 B.C., there were the usual decuriones, ædiles and other public officers, also many priests, priestesses, ministers and magistrates. Pompeii was built on the point of an ancient stream of lava, running towards the sea, close to the then full-flowing river Sarno. The city was the natural south-eastern port of the plain through which the river flowed. The sea was then not more than 1,500 feet distant from the city, the river serving as a harbour. On the banks of the river stood a small suburb of the city. From the busy port were exported not only the produce of the country in the interior but also the products of the plain itself, namely, wine and vegetables. The lava was cut into millstones, which formed a large article of export in the second century B.C.; but later on this source of profit ceased to be cultivated, and millstones were even imported into Pompeii from abroad. The harbour town grew more and more wealthy, from the fact that the Roman aristocracy, attracted by its beautiful situation and fine climate, began to settle in the environs. The inhabitants of Pompeii at that time numbered probably 30,000.

It will be remembered that the volcanic mountain, on the slopes of which Pompeii stood, re-awoke after ages of inactivity

in the year 63 A.D., when many buildings in the city were damaged or destroyed. Traces of the earthquake that happened then are still to be seen in the excavated city. Then in 79 A.D. came the awful eruption which, while the people were still repairing the damage done in 63, buried the city to a depth of more than 6 feet in small pumice-stones, and some time later with a rain of ashes to a similar depth. Those pumice-stones and ashes were not red-hot, as is generally believed, as the wood which has been found seemingly carbonised has only been thus changed by chemical processes. Traces of real burning on the mural paintings are very easily distinguished from the red tint which, in some unexplained way, overspreads a great portion of the wall-paintings when these have come in contact with the ashes. The manner in which Herculaneum was buried was very different, for there the pumice and ashes do not lie in regular strata as in Pompeii, but are mixed together in a sort of muddy paste, which, hardened into stone during the course of time, makes excavation difficult. After the catastrophe the upper storeys of the houses in Pompeii protruded above the ashes, showing where the city lay. Digging on a large scale then took place, and building material and valuable objects were carried away. All the marble, except a very few fragments, were removed in ancient times. Later on the remaining upper storeys of the houses were destroyed by time, as very little of them has been found. In 73 A.D. most of the inhabitants escaped. It has been calculated that only 2,000 of the 30,000 were killed on the spot, but how far the fugitives were able to run is not known; the fact is that many of them were overtaken and buried by the falling ashes at a place on the banks of the Sarno not far from the city, for in 1880 and 1881 many skeletons, together with many valuable objects now kept in the Naples Museum, were found there.

Though the existence of Pompeii under the fields that then covered it was discovered as early as 1594, the city has only been regularly excavated since 1748, and till the year 1825 only the public buildings round the Forum, the Theatre, the Street of Tombs had been laid open to the view. The present reasonable and scientific mode of excavation was begun by Professor Fiorelli in 1881, and continued by Professor Ruggieri, who has only just resigned his office in consequence of his advanced age. At present nearly half of the whole city is excavated, and the circle of its walls determined. It is probable that the still unexcavated part will not contain many public buildings, perhaps a few temples and baths, but if the present slow rate of excavation be continued it will take another fifty or sixty years to lay the whole city bare. The shape of Pompeii is nearly oval; the city walls follow the slopes of the lava-hill on which it is built, only crossing that hill at the part where it rests against Mount Vesuvius. Pompeii was laid out on a fixed plan. The two principal streets, Strada di Mercurio and Strada di Nola, crossed it from north to south and from west to east. The side streets run crossways to these two, and only slightly deviate from the straight line at certain points. The city wall is preserved in its northern part and a great portion of its southern course, but on the west and at the west corner of its southern course it was already pulled down in ancient times, and its place occupied by houses. The wall has eight gates, to which distinguishing names have been given. The public buildings that have been found are situated in two groups—one around the Forum and the other near the Stabian Gate. But the public baths are distributed irregularly all over the city. The most important houses have been named according to very different reasons, some after distinguished persons who have witnessed their excavation; for example, the "House of the Grand Duke of Tuscany," others after objects of art found therein, as the "House of the Faun," and others again after their supposed proprietors, as the "House of Sallust." It is well to take notice of these names, as it is under them that the guides point out the buildings. A more reasonable method of naming is that from the bronze seals discovered in the houses, engraved with the names of the owners or from inscriptions.

The oldest building in Pompeii is the destroyed Doric temple, which belongs to the sixth century B.C. The city wall is also extremely ancient, but even an approximate date cannot be determined. The rest of the buildings belong to two distinct groups, according as they were built before or after the founding of the Roman colony in 80 B.C. The pre-Roman edifices are artistically the best. They were built under the direct influence of Greek culture, and show the pure, beautiful forms of the Doric, Ionic and Corinthian styles. Especially remarkable is the spirited style of the Corinthian capitals, built of no costly material. The columns and the beams are generally of grey tufa-stone, coated with white or coloured stucco; marble is rarely found. The technical work is also imperfect. But the Roman buildings, though of an inferior and often coarse style, are made of superior material, such as marble, or the fine limestone called travertine, and the workmanship is better. The Basilica, the Temple of Apollo, and probably the Temple of Jupiter, the oldest portions of the Forum, the so-called "School," the Stabian Baths, the large Theatre, the colonnades of the Triangular Forum, the barracks of the gladiators, the

Palæstra, the outer portion of the Porta Marina, and the inner portion of the other gates all belong to the public edifices of the pre-Roman period. To the early time of the Roman colony belong the Baths near the Forum, the small Theatre, the Amphitheatre, the Temple of the Capitoline Divinities, and the inner portion of the Porta Marina. All the other public buildings were built in the later Roman time.

The mural paintings belong to four successive styles. The first style, that of the pre-Roman period, consists in imitations of marble decorations in plastic stucco-work. There are no figures or pictures in this style. The second style, belonging to the time of the Roman Republic, consists in painted imitation of marble, and also in realistic, not fantastic, pictures with architectural subjects, showing edifices such as might have actually existed. The third style, that of the Roman Imperial period, till about 50 A.D., is ornamental decoration in the Egyptian taste, distinguished by pure and beautiful forms in tender and graduated colouring. The fourth style, belonging to the time immediately previous to the destruction of the city, shows a peculiar love for fantastic, slender, playful architectural subjects, and is the kind generally understood when we speak of Pompeian wall-paintings. The colouring is less delicate, the ornaments not so pure in form, but all are stronger and more effective. Especially admirable is the rich fancy displayed in the architectural decoration. Almost all the figure-subjects in the paintings of Pompeii belong to the third and fourth styles.

Pompeii was well and entirely paved in its earliest days, and well provided with drinking water. The Oscan and Latin inscriptions engraved or painted in red colour generally relate to elections; a few are announcements of games. What can be deciphered of the "graffiti" or scratched inscriptions show that they were individual effusions, the expressions of good wishes, the mention of games, verses, &c. A number of wooden tablets, coated with wax and inscribed, which were found in the house of the banker, L. Cæcilius Jucundus, have now been deciphered in the Naples Museum, and are mostly receipts.

The few fragments of the ancient Doric Temple on the Triangular Forum show that it greatly resembled the famous temples of Paestum and Selinus. The temple was already destroyed in the early days of Pompeii, and a shabby sanctuary erected in its place.

EAST RIDING ANTIQUARIAN SOCIETY.

THE second annual meeting of the East Riding Antiquarian Society was held at Driffield this week, and the proceedings lasted two days. A good number of the members from all parts of the Riding, as well as several from other parts of the county, the *Leeds Mercury* says, assembled in the Corn Exchange at one o'clock on Monday, when the annual report and balance-sheet were submitted and duly passed. The president, the Rev. Dr. Cox, F.S.A., took the chair, and was re-elected president for the ensuing year on the motion of Colonel Haworth Booth, seconded by Mr. Councillor Hall. The long list of vice-presidents were reappointed, with the addition of Lord Londesborough, who has just joined the Society. The council were reappointed with certain additions, and the Rev. A. N. Cooper, vicar of Filey, and Mr. Andrews, F.R.H.S., of Hull, were appointed joint hon. secretaries. Mr. Leach, F.S.A., read a paper on the "Beverley Town Register Book," which begins in 1436.

After a short interval for luncheon, the party reassembled at the Mortimer Museum, which has so great a repute among archaeologists of the prehistoric period. It contains a wonderfully-extensive and well-arranged collection of flint implements and pottery and other details pertaining to the Stone Age, as well as a few relics of the Bronze Age, which have been gathered together after many years patient toil by those well-known barrow-openers, the Messrs. Mortimer, from Yorkshire tumuli. It is admittedly by far the best English collection of prehistoric relics from any one given district, and supplied many of the examples which are described and illustrated in Sir John Evans's authoritative work on the "Ancient Stone Implements of Great Britain." The museum also contains a very good geological collection, but with that the antiquaries had no immediate concern. Short descriptions of the more important features were given by Mr. J. R. Mortimer and by the Rev. E. Maule Cole, the vicar of Wetwang, and by Dr. Cox, who drew attention to the smaller collection of Anglo-Saxon and Roman antiquities. Over 10,000 flint weapons are in this remarkable collection, as well as the contents of upwards of 300 Yorkshire barrows.

The members then proceeded to the fine church of All Saints, which was restored at a considerable cost by Sir Gilbert Scott in 1879-80. The Rev. Dr. Cox gave a general description of the building. He said that there seemed to be no trace here of a Domesday church, though at the time of the great survey Driffield was an important centre of Christianity, and possessed two churches, one of which doubtless was on this site, and the

other at Little Driffield. At a later Norman date a church on a considerable scale was erected here, as was shown by four round arches and supporting piers of the nave arcade on each side, separating it from the aisles. The clerestory windows above were also late Norman. It was rather difficult to judge of the date of this work, as it had been so extensively repaired and rebuilt (apparently a matter of necessity) at the time of the restoration; but perhaps it was transition from Norman to Early English, about the end of the twelfth century or beginning of the thirteenth, which was certainly the date of the fine circular south doorway, with its dog-tooth moulding. To the same date belonged the plainer north doorway. The consecration cross incised on the north jamb of the south doorway showed that there was a considerable rebuilding and enlargement of the fabric, involving a new position on fresh ground for the high altar at that date, otherwise consecration would not have been necessary. In the last half of the fourteenth century the south aisle was rebuilt, the windows being remarkable examples of late Decorated design. The tower, chancel and north aisle were of the Perpendicular period, about 1450. The noble tower was specially praised, the enrichment of the design in the upper stages insensibly drawing the eyes upward. After commenting on the early part, the piscina-drains, and the absence of old monuments, Dr. Cox referred to the registers, which begin in 1556, and are specially interesting in the Commonwealth during the time that marriages were celebrated before Justices of the Peace. He also commented on the still prevailing custom at Driffield of ringing the "Harvest Bell" at 5 A.M. and 7 P.M., and said that originally this denoted an unusually early hour for the daily mass, and for the daily evensong during the longer hours of labour at a time when English labourers were often habitual churchgoers. Dr. Cox contended that church bells were never originally used only as secular time-tellers, though the religious side of the custom had often died out, as was the case at Driffield. Mr. Temple Moore, the well-known architect, followed with a description of the changes effected in 1880, when he was engaged under Sir Gilbert Scott.

The Moot Hill was visited about four o'clock, when a short paper was read by the Rev. E. Maule Cole on "Folk Moots." He said that this Moot Hill had probably been originally a British barrow, and that it was afterwards enlarged and used as a place of public assembly, and for public proclamations. A brief discussion followed, which was taken part in by Dr. Cox, and by Messrs. Leach, Andrews and Hall.

A short walk of about a mile brought the party to Little Driffield, where the Rev. A. N. Cooper, vicar of Filey, read a brief but admirable paper on "King Alfred of Northumbria." He said that Alfred of Northumbria, like many illegitimate sons, far exceeded his legitimate brother in abilities and virtues. He came over from Saxony in 543, and made himself master of all the country north of the Humber. Northumbria, over which he reigned, had a fixed frontier on the south of the Humber, and on the north a movable one embracing two or three counties north of the Tweed, and sometimes going as far as the Forth. For over 100 years the kingdom was united or divided into two kingdoms of Bernicia and Deira. Alfred's father was Osway, and at the latter's death in 670, Alfred was rejected as king by the nobles on account of his illegitimate birth. For fourteen years, while his brother reigned, he retired into private life and study in Ireland, where he acquired great learning. Probably his studies would comprise jurisprudence, Latin poetry, arithmetic and astronomy. His reign was devoid of historic interest, except as to his quarrel with Bishop Wilfred, whom he drove out for encroaching on the royal prerogative, and not even a letter from the Pope would reinstate him. Mr. Cooper expressed his belief that Deira was the derivation of the name of Driffield. To this day there is a mound known as the "King's Mound" in the "King's Field." In conclusion, people were apt, he said, to speak contemptuously of the Anglo-Saxons, but he believed they were as well clothed and as well behaved as ourselves. King Alfred might be compared to the late Comte de Paris, both having betaken themselves to study, and he claimed for him a position worthy to rank with the best of our blood royal. Alfred the Wise died at Driffield in the year 705, and was buried in the old church of Little Driffield, as is recorded on a mural slab, the inscription of which has been often renewed, and is now rather absurdly worded "Northumberland," instead of Northumbria. This once interesting and early fabric was rebuilt and curtailed after a singularly bald and evil fashion in 1809; all the old work was destroyed, except the tower and part of the south wall of the chancel. In 1890 it was much improved, and the 1809 parts removed to make room for decent work by Mr. Temple Moore. That gentleman gave an interesting account of the fabric. The lower stage of the tower is Norman, and the upper stage is of fourteenth-century work. The tower arch, however, shows obvious traces of an arch older than the Norman, and hence there is little doubt that a portion of this part of the fabric is of pre-Conquest or Saxon date. In the walls are a large number of fragments of Norman incised grave

covers, as well as one piece of Saxon knot-work, which were pointed out by Dr. Cox.

The annual dinner was held at the Buck Inn at 6.30, when upwards of sixty of the members and their friends filled the tables. The President took the chair. The toasts were confined to "The Queen," "Success to the East Riding Antiquarian Society," and "Prosperity to Driffield." From eight to ten the members were entertained at a conversazione at Highfield, by the kind invitation of Mr. and Mrs. Harrison Holt. In the intervals of music short papers were read by the Rev. Marmaduke Morris, rector of Nunburnholme, on "East Riding Dialect in Agricultural Terms," and by Mr. Nicholson on "The Stocks of the Riding," and short addresses were given by Dr. Cox and Mr. Leach, F.S.A.

The most important feature of Tuesday's programme was the visit to Watton Priory, when the excavations just concluded were described by Mr. W. St. John Hope, secretary of the Society of Antiquaries, but which we have not space now to include.

SPECIFICATION WRITING.*

(Continued from page 190.)

I HAVE prepared some copies of the synopsis of the specifications I am accustomed to use. If you will refer to them I will go over them hastily, noting some of the more important matters, and will not further take up your time.

GENERAL WORKING SYNOPSIS OF SPECIFICATIONS.

Excavation.—(Refer to General Clauses.)

Top soil. Disposal of earth, cart it away? Deposit on lot—to grade—in piles? Depth of cellar. Depth of trenches. Inside, outside. Width of footings. Vault. Grease-trap.

Well.—Include walling, include manhole. Trenches for pipes. Include digging and refilling. Shoring of walls—adjoining. Shoring of earth banks, if necessary. Pumping of water, if any. Cleaning of old wells; filling of same.

Stonemason.—Refer to General Clauses.

Stone.—Cellar and backing; sizes, kind. Facings: sizes: kind of wall—broken-range, random-coursed, coursed. Dressed—how? rock-faced? All on natural bed: jambs dressed, arrises cut. Specify bonding.

Footings, Stone.—Depth, width, kind of stone, sizes; squared? edged?

Footings, concrete.—How mixed? who furnishes forms? Thickness layers, ramming. What cement? what sand? what proportion of each.

Testing of Cement.—For fineness—what mesh? Tensile. Compression. Boiling.

Thickness of Walls.—Piers, sizes. Cellarway. Foundation for steps.

Levelling of Walls.—For joists, sills, frames, heads, plates. Leaving chases for pipes, posts, flues. Building in blocks, strips, frames. Skew-backs for arches. Arches: what soffit, if necessary? cut? rough-face?

Mortar.—Any cement? what kind? Lime, any particular kiln or make?

Sand.—Bar, road, creek, bank? What proportions of lime, sand and cement, if any?

Pointing.—Lime mortar. Marble dust. Cement: what kind? any sand? what style of pointing? Anything as to bad earth foundations, rock in cellar: blast it, sledge it, plug and feather. Owner to pay per perch? owner to have?

Old Walls.—Stone to be reused, removed, contractors, owners. Who supplies water? Scaffolding, who supplies?

Cut Stone.—Pier-caps, chimney-caps, girder-blocks. All sizes, kind of stone, dressed. Ashlar: how thick? how clamped? Sills: moulded? plain? Cut to wash, throated. Heads: moulded? plain? Platforms: steps, balustrades, moulded rails? turned or square balusters? Bands: moulded? plain? left for carver? Columns: full diameter? half diameter? fluted? left for carver? Caps: left for carver? moulded? Pilasters: plain? panelled? left for carver? Cornices: size; projection; bed. Curbing: what kind? all sizes. All sizes, kind of stone, style of dressing. Marble or slate treads and risers to iron stairs?

Stone Pavement.—What kind? all sizes; dressed? rough? Any cutting for doors, manholes, plumbers' fittings? Remember to set sills free in middle. Remember that fine limestones must be laid in lime-mortar and that cement must not touch limestones in joints or backing.

Bricklayer.—(Refer to General Clauses.)

Who supplies scaffold? who furnishes water?

Bricks.—For cellar, piers, facing, backing, footings. What kind and colour? any particular make? how laid? what kind

* A lecture delivered before the Architectural Department of the University of Pennsylvania by Mr. T. Roney Williamson, architect, and published in the *American Architect and Builder*.

of mortar? If for footings, width, number of courses; what racking?

Bonding.—Old English? Flemish? behind facing? every fifth course headers?

Moulded Bricks.—Make, colour, kind. Catalogue number. Specify all inside and outside returns. Any lead covering on moulded bricks? Building in blocks, strips, frames. Levelling for joists, sills, frames, heads, plates. Chases for pipes, flues, posts.

Arches.—Flat, semicircular, archhead, elliptical, segmental. Bricks ground or moulded?

Mortar.—Cement? what kind? with sand? what proportion?

Cement Tests.—Boiling, tensile, compression—what fineness? what mesh?

Lime Mortar.—What lime, if any preference? what sand? what proportion?

Coloured Mortar.—What colour? any particular make of colour? Trimmer hearths. Ashpits. Foundation for range. Bricking of heater.

Fireplaces.—Backs and sides; what kind? state price; any dampers? Inside hearths; what kind? specify round hole and plate. Outside hearth; what kind? name price. Omit place in other trade? Brick finish on face of chimney-breast? what brick? Any porch piers? columns? any special chimneys? any brick pavements? Walls to be built from outside scaffold or overhead from trestles? Clean walls; oil walls?

Cisterns.—Brick? cemented? manholes, covers; padlocks? guarantee tightness.

Any Fireproofing.—Hollow tile? porous terra-cotta? brick arches? Specify sizes.

Any Damp-proofing.—Inside furring bricks? Any damp-proof under walls—aspalte? slate in cement?

Terra-cotta.—Name of maker; specify parts to be terra-cotta. Specify straightness, colour, even shade, square joints. Modelling. Omit? name price?

Old Material.—Clean and pile? use headers and bats? to be contractor's? owner's? reused or carted away? Wet bricks before using; how? Any joist hangers or sockets? if so, notify bricklayer to build in.

Mosaic Floors and Wainscot.—(Refer to General Clauses.) Name price per foot. Specify kind and pattern. Marble wainscot? floors? kind? thickness? finish? Other marble-work, if any. Tile hearths? facings? Name price per foot set. Floors, wainscot—mosaic?

Cement Floors and Pavements.

Specify method; thickness; who fills to cement level? Name kind: granolithic? metallithic? any other make? require guarantee.

Carpenter.—(Refer to General Clauses.)

Does carpenter superintend work? give sizes, heights, &c., from drawings. Who supplies scaffold for mason? for bricklayer? centres for arches? strips for furring? blocks for finish?

Joists.—Kind, sizes, backing and lining, where used? Porch? Framing hangers, double trimmers, headers, double under partitions. Framing for hearths, flues, stairways, lifts, skylights. Bridging, kind; how often? what sizes? Any hangers or sockets? what kind? whose make? Joists adzed for tile floor or mosaic? Floor cut-in for tile flooring or mosaic?

Girders.—Kind, sizes; bolted or spiked? framed level? or under joists? cleated?

Mill Construction.—Sizes of beams, material, plank floor, splined. Top floor: under flooring specification.

Posts.—Rough? turned? What kind? any bolsters? any brackets or struts?

Studs.—Material, sizes, double at corners? at openings? Pockets for sliding doors, line them?

Studs at Corners of Building.—Material, sizes, braced, what kind? Heads to partitions? Sizes.

Sill.—Sizes, material, bed in mortar; bolted to wall?

Girths.—Sizes, material; let into studs?

Plate.—Sizes, material.

Sheathing.—Material, thickness; surfaced? matched? laid diagonally?

Sheathing-paper.—Kind, trade, thickness.

Rafters.—Sizes, material, framing. Outlookers? rafter-ends cut to shape?

Trusses.—Describe fully with all rods, bolts, plates, shoes, &c.

Purlins, Valley Rafters, Hips.—Sizes, materials.

Roof-covering.—Sheathing, same as above. Paper: kind, trade-thickness. Shingles: lengths, widths, weathering, quality; trade terms? shapes?

Gutter-strips.—Size; iron brackets screwed on?

Eaves-troughs.—See "Tinner."

Rough Framing for cupolas, ventilators, trap-doors, cellar-ways, stair-horsings, porch-floors: sizes, material.

Rough Doors.—Cellarway, trap-doors, thickness; dressed? matched? battened? hinged? fastenings.

Flooring.—Material, quality, thickness. Kind: comb-

sawed? blind-nailed? face-nailed? width; matched? scraped? planed off all over? joints struck? put down after plastering; screwed down over pipes and wires. Rough floor under: kind, thickness, diagonal?

Ceilings.—Walls, lined? air-shafts, well-holes, elevator-shafts, dumb-waiter shafts, lined or cased? material; quality; beaded? matched? moulded? panelled?

Stalls.—Material; posts, turned? material. Loose boxes? standing-stalls? wood-carpet? parquetry?

Millwork (in Carpenter).

Cupolas, ventilators. Mouldings, posts, caps, louvres, finials, rails, balusters, cornices.

Box-frames.—Plank front? reveal; solid-heads? jib-heads? yellow-pine sills, parting-strips, sash-beads; veneers on box-faces? Twin frames; triple frames; double-hung weights? Outside shutters? outside blinds? thickness, material, hinges, all hardware. Inside blinds? thickness, material, panelled? rolling-slats? hinges; all hardware. Rolling-blinds? kind, material; look out for pockets.

Caseament-frames.—Thickness; moulded? transoms?

Sash.—Sizes, material; any jib-head sash? How hung: with hinges? lead-weights? iron-weights? sash-balances? brass-tape? bronze-chain? cords? How fastened? look out for right kind.

Fly-screens.—What make? special? thickness, kind of wire.

Inside-sills.—Kind, material; moulded?

Aprons.—Kind, material; moulded? Architraves, plain? with band? with cap? Material: any variation through building? Washboards, sizes, size of cap. Sub, sizes, if any. Material: any variation through building? Jamb-casings, head-linings: material, plain? moulded? Rebate-strips? sizes, material.

Boards for Pipes.—Material; moulded?

Casing over Chases for Pipes.—Panelled? screwed; brass-screws?

Shelving.—Material.

Pin-rails.—Material; hooks? wooden pins?

Dressers.—Pantry: with glass doors? panelled doors? hardware; material. Kitchen: Material, hardware; drawers? cupboard under?

Drain-boards.—Material.

Porches.—Describe fully: mouldings? turnings? brackets? carvings? lump sum? name carver? omit? contractor to supply material for carving?

Front Door.—Frame: size, material; panelled-jambs? transom, moulded? transom sash: thickness, pivoted? hinged? fixed? all hardware. Doors: thickness, material, moulded? panelled? with glass? double? single? Dutch? (if Dutch, look out). All hardware? If hardwood, veneered.

Vestibule Doors.—Side-lights? fixed? sash? thickness. Transom, moulded? transom sash: thickness, pivoted? hinged? fixed? all hardware. Doors: thickness, material; same as front door? for glass? all hardware. If hardwood, veneered.

Inside Doors Hung.—Thickness, material, number of panels; moulded? all hardware. Closet doors, same? all hardware. If hardwood, veneered.

Sliding Doors.—Thickness, material, number of panels; double or single? astragal or rebate joint? with edge strips? all hardware. If hardwood, veneered.

Doors to Water-closets.—Slat? panelled? short? spring-hinges? all hardware.

Doors to Shower Baths.—Slat? panelled? short? spring-hinges? all hardware; material.

Wainscot.—Thickness; mouldings? panels? note carving, if any.

Outside Steps.—Framing, material, moulding, setting.

Cornices, Pediments.—Material, quality, mouldings, brackets; any carving? lump sum? omit?

Stairways.—Back stairs: treads, nosed, risers, string, housings; open string? rail, balusters, posts, mouldings. Main stairs: lump sum? without horses? without finishing?

Water-troughs.—Material, ploughed joints? white-leaded? straining-rods?

Feed-bins.—Material; zinc-lined?

Mantels.—Price fixed? omitted?

Elevator-screens.—Material.

Dumb-waiters.—Kind, make; price allowed? omitted? Sliding sash-partitions. Pulpits. Altars. Altar-rails. Pews. Benches. Vestment-lockers. Choir-lockers. Reredos. Hotel-counters. Desks. Bank-partitions. Bank-counters. Counters. Store-fixtures. Show-cases. Book-cases. China-closets. Harness-closets. Picture-mouldings. Ceiling-beams. Paneling. Does carpenter close in openings with muslin in cold weather before glazing?

Plumber.—(Refer to General Clauses.)

Permits. Sewer-connections. Board of Health rules.

Drain-pipe.—Jointing, cement, sizes, kind; for soil; for rain-conductors. Is drainage to city sewer? well? flush-tank? who digs? where? Is drainage Waring's system? done by patentee or plumber?

Soil-pipe.—Size, weight, trade weight or mark; coated? all fittings; trap, running-trap, clean-out, lead-joints; carry soil-pipes through roof; any anti-syphon pipes? test soil-pipes to three pounds pressure.

Supply-pipe from Main.—Material, size, joints—wiped if lead, screw if iron galvanised; stop-and-waste; pave-wash; if lead-pipe, give weight per foot.

Supply-pipes in House.—Sizes, materials, to each fixture; lateral runs below floors; stops-and-wastes on rising branches; tags on faucets; boiler-connection, hot-water supply, proper supports, brass ferrules for lead-connections, wiped joints on lead pipe. Pipes exposed? if so, nickel, or bronzed?

Tank.—Wood? cedar, size or number of gallons; number hoops; iron? painted? galvanised? size, number of gallons; overflow; drain, where to? stop on drain-pipe.

Safety-tray.—Lead? zinc? number pounds to foot; waste from same to cellar floor? to outside building?

Waste-pipes.—Material, sizes; when exposed, nickel-plated brass? lead? give weight; galvanised iron? cast-iron coated? give trade weight; carry waste through roof, anti-syphon pipes? does waste join soil-pipe? any grease-traps?—brick or at fixture? does waste run separate to well? to sewer?

Traps.—On all fixtures; what kind—"Bennor?" "Cudell?" "Puro?" "Bower?" brass? lead?

Fixtures.—Give catalogue page and numbers, if possible, and how many of each.

Water-closets.—Include seat and lid? cistern? marble under water-closet?

Bath-tub.—Cased? splash-board? what kind? marble under? what waste? what faucets? sprinkler? silver or nickel?

Washstands.—Iron? marble? exposed? apron, brackets or legs? bowl—oval? round? size; decorated? plain? waste fixture, what kind—silver-plated? nickel? faucets—what make, silver or nickel?

Hip-bath.—What kind? silver or nickel trimmings?

Shower-bath.—What kind? silver or nickel trimmings?

Pantry Sink.—Porcelain? copper? enamelled iron? exposed? kind of faucets; make; silver? nickel? brass?

Kitchen Sink.—Size, kind, make, legs? brackets? back? faucets, kind, make; brass?

Stationary Wash-trays.—What kind—soapstone? enamelled iron? porcelain? wood? indurated fibre? with lids? what wood? what faucets—brass?

Urinals.—What kind? make? with marble or slate backs, floors, sides? Automatic, or with faucets? Waste from floors.

Stop Sinks.—Galvanised? painted? enamelled? porcelain? Any marble or slate enclosures for water-closets? marble floors? Do washstands stand in rows? marble tops jointed or in one? Are shower-baths enclosed in marble or slate partitions?

Circulating Boiler.—What make? self-cleaning? on stand? on wall? waste; sediment-cock; galvanised iron? copper? copper connections? galvanised iron connections?

Range.—Stationary; who sets? portable? slate bottom? slate hearth? zinc hearth? plate-warmers?

Hotel Fixtures.—Broilers, boilers, steam-cookers, plate-washers, mangle, washing-machines, hot tables?

Gas Piping.—Permits. Comply with gas company's rules and regulations. Test system. Cap outlets. Pipe to grade to meter connection; stop-and-waste. No drops in pipe to outlets. No cutting of joists at greater distance than one foot from bearing. Measure for all outlets to centre of ceilings or heights and position on walls. No pipe smaller than one-half of an inch. Specify sizes of mains and branches. Are pipes to be exposed?

Any Hot-water Heaters.—Who supplies? who connects—heater-contractor? or plumber? Any stable? bell-traps, stalls, gutters. Hydrants with stop-and-waste below frost?

(To be continued.)

Ventilation of Theatres.

SIR,—May I hope that one or two of your readers have to do with theatres, either as builders, managers or architects thereof, and that they may turn their attention to a matter which the medical profession, through their mouthpiece, Dr. Parkes, think to be of the utmost importance. I allude to the great need of fresh air in theatres. To the clergy I feel it hopeless to appeal; the outcome of correspondence on this subject a year or so ago in a Church paper shows them to be utterly indifferent to the ordinary rules of health as well as to the bodily needs of their flocks—hence I venture to appeal to sensible people through your columns.

I do not know the builders, architects, or Mr. Standen

Triggs, of Devonshire Park Theatre, Eastbourne, and have no interest in the takings of any theatre; so I merely wish to ask why, quite disinterestedly, most theatres—Devonshire Park being the only exception I know of—are neither more nor less than the Black Hole of Calcutta redivivus, and no care taken whatever to insure the comfort of the audience, a mixture of odours of humanity and gas being very prevalent?

Take any London theatre. Here I pay 10s. 6d. for my stall and 6d. for a programme, and generally have to leave an hour after the performance has begun, in a state of semi-faintness or suffocation. But Mr. Standen Triggs knows how to secure the comfort of the public in general, and mine in particular, and I trust if any of your readers wish to know how he does so, they will pervade his theatre and inspect it very closely. They will judge for themselves that I am right in saying, for I took a stall one night and a gallery-seat the night following to test the ventilation as well as the view I could get of the stage, and I note (1) that the worst seat in the gallery gets as good a view as the best stall; (2) that nothing could exceed the efficient ventilation; (3) that in the gallery, as well as in the stalls, I could sit through the whole performance and inhale fresh air the whole time. The nearest approach to Mr. Standen Triggs's arrangement is to be found at the Pavilion Music Hall, London.—Yours faithfully,

H. J. CUNLIFFE (M.A., Oxon).

New University Club, London.

GENERAL.

The Council of the Society of Engineers have unanimously elected Mr. Perry F. Nursey, a past president, and for thirty-six years a member of the Society, as honorary secretary and treasurer, in place of the late Mr. Alfred Williams, who had occupied the position since the foundation of the Society in 1854.

The Partnership between Mr. Collings Beatson Young and Mr. Arthur George Spencer, architects and surveyors (Young & Spencer), has been dissolved by mutual consent.

Mr. T. W. Baker, B.A., will read a paper on "The Utilisation of Town Refuse for Generating Steam," at the meeting of the Society of Engineers, on Monday, October 1.

Dunboy Castle, near Berehaven Harbour, on the south coast of Ireland, which is one of the finest buildings in Ireland, took fire on Monday.

Thursday, October 4, has been appointed for the reception of works of art intended for the autumn exhibition (the thirty-ninth) of the Nineteenth Century Art Society, at the Conduit Street galleries.

Articles on the "Design and Specification of Electric Lighting Works, for Architects and Civil Engineers," by Mr. Howard Pentland, of Dublin, and Mr. Gibbings, of Hull, will be commenced next week in *Electricity*.

Professor Alleyne Nicholson will commence a course of twelve lectures under the Swiney Trust, on the "Earth's Crust," in the lecture theatre of the South Kensington Museum on Monday.

Two Marble Statues have been discovered in excavations at the Mirror Palace at Sainte Colombe de Vienne (Rhône). One is over 6½ feet without the pedestal, and apparently represents Rome. The head was recovered, but the arms are missing. Lying at the feet of the figure are a helmet and the vestige of a shield. The second is about 3 feet in height, and represents a child standing erect on a pedestal, but the head has not yet been found.

Mr. G. F. Watts, R.A., has received from Washington an engrossed copy of the Act of Congress, accepting on behalf of the American nation his picture *Love and Life*, which he presented to the United States after its exhibition at the Chicago World's Fair.

An Old Chest which lay for many years in the Custom House, Greenock, is now supposed to be one of the treasure chests which belonged to a vessel of the Spanish Armada, and it has been forwarded to London.

A Sum of 500l. has been placed at the disposal of the vicar of Bromley, by Mrs. Courage, for the restoration and decoration of the chancel of the parish church.

The Seventh Autumn Exhibition was opened on Wednesday at Dudley in the Corporation Art Gallery. About 150 works are shown, not a numerous collection as compared with the past, but far exceeding the usual order of merit.

The Private View of the collection of works by living marine painters will be held to-morrow (Saturday) in the Birmingham Art Gallery.

At the Meeting of the Australian Institute of Architects, Sydney, the following were elected office-bearers for the ensuing year:—President, Mr. J. Horbury Hunt; vice-president, Mr. J. B. Barlow; hon. secretary, Mr. J. J. Davey; hon. treasurer, Mr. J. M'Donald; members of Council, Messrs. W. G. Coward, W. Kenwood, T. Rowe, A. Thornley and H. A. Wilshire.

The Architect.

THE WEEK.

AN accident has occurred in Dublin during the demolition of a part of a building which merits more attention than cases of the kind commonly obtain. On the south side of the river Liffey runs a quay known as Sir John Rogerson's on which towards the eastern end are manufactories which in no other city would be allowed to be opened so near to the inhabited parts. Among them are the works of the United Alkali Company. It was arranged to pull down a disused furnace. While a couple of men were engaged in the operation a brick archway, which was a few feet away, collapsed, and a large portion of it falling on one of the men killed him. It required thirty men to remove the debris, and they were engaged for twenty minutes before the corpse could be extricated. At the inquest the foreman of the works said that the demolition on which the men were employed could not interfere with the arch. What was the cause of the accident? Many people in Dublin would say that the water of the Liffey does find its way to the ground alongside the quays, and, moreover, there is a canal basin at a higher level on the opposite side, from which water could easily descend. It is easy to imagine that any intrusion of water would affect the foundations of an arch which was not in a perfect condition. On the north side of the river a large goods store belonging to a railway company collapsed before it was used. It was then discovered that the foundations which appeared secure were on a layer of the hardest gravel, that rested on mud. Mr. STRYPE, an engineer who gave evidence on the inquest about the accident at the alkali works, considered that the cause was not a settlement of brickwork. He stated that he believed the archway fell in consequence of the contraction of the mass of masonry during cooling after long exposure to heat. The contraction would produce a pressure which would be imperceptible except to an expert. The condition of the archway was dangerous, but it would take a highly-skilled person to appreciate the danger. It would have been advisable to have the place examined by a skilled person before the work was entered upon, but it was usual in such work to employ men of the class to which the deceased belonged. He considered that the work in which the man was employed did not cause the falling of the masonry. With Celtic impetuosity the Coroner declared that in his opinion the Alkali Company had been guilty of negligence in not having the place examined by a skilled person. Now Mr. STRYPE may have discerned the real cause of the accident; but, after all, he was only putting forth a supposition. The expansion and contraction of brickwork are not subjects for which much trustworthy data are recorded. Thousands of furnaces are allowed to cool, and are left years without examination, and yet accidents do not occur to men who come near them. The Dublin arch, we believe, was not subjected to strains for years, unless of the imperceptible kind which arise from the mutations of climate. Under such circumstances can we suppose that a collapse could occur which is all but unknown in great ironworks and other places where the heat was likely to surpass the Dublin temperature?

On next Monday evening Mr. W. ANDERSON, F.R.C.S., will commence a course of six lectures on anatomy at the Royal Academy. The demonstrations will begin on October 29. The subjects of the lectures on chemistry by Mr. A. H. CHURCH (of which the first will be given on November 19) are grounds for painting, pigments, selected palettes, vehicles and varnishes, methods of painting and conservation of pictures. The subjects of Mr. J. E. HODGSON'S and Mr. G. AITCHISON'S lectures are not announced. The arrangements for the delivery of lectures on sculpture have not yet been made. If the constitution of the Academy allowed, it would be better to give up lecturing on subjects like architecture, painting and sculpture, for as time goes on the inutility of such short courses becomes more apparent.

"DISCOVERIES in Architecture" will form the subject of Professor ROGER SMITH'S public opening lecture at University College, on Thursday evening, the 11th inst. Among other illustrations it is intended to show by the lantern photographs of the remarkable Greek sarcophagi, covered with fine sculpture and architectural decorations, which were discovered some years ago at Sidon. The Metropolitan Building Act, 1894, will form the principal subject of Professor ROGER SMITH'S lectures to his class of modern practice at University College, London, in the session about to commence.

THE next session of the Architectural Association will begin with a conversazione on Friday next. The annual general meeting will be held on the 26th inst., when Mr. E. W. MOUNTFORD will deliver an address. The following papers will be read at the ordinary meetings:—"The Study of Modern Architecture," by Mr. A. BERESFORD PRITE; "Sanitation in Regard to Hospitals and Infirmaries," by Mr. KEITH D. YOUNG; "The Modern Theatre of the Continent," by Mr. E. O. SACHS; "Architectural Illustration," by Mr. C. G. HARPER; "Bricks," by Mr. JOHN SLATER, B.A.; "Architectural Perspective," by Mr. W. S. WEATHERLEY; "The Bridges of London, Architecturally Considered, with Illustrations," by Mr. H. H. STATHAM; "The Use of Sculptural Decoration at the Present Time," by Mr. T. STIRLING LEE; "Plaster Work," by Mr. F. W. POMEROY; "Iron and Brass," by Mr. J. W. SINGER; "Specifications, from a Builder's Point of View," by Mr. HENRY HOLLOWAY; "Specifications, from an Architect's Point of View," by Mr. EDWIN C. PINKS; "Painting and its Relation to Architecture," by Mr. C. W. WHALL; "Treillage," by Mr. JOHN BELCHER; "The Influence of Architectural Style upon Design," by Mr. WALTER CRANE.

ST. ENOCH'S CHURCH, which, from its proximity to the principal railway terminus, becomes soon familiar to English visitors to Glasgow, seems to be doomed to removal. Owing to underground works the building has become unsafe, and the Presbytery of Glasgow, considering that it would take a very considerable sum to put the church into a proper state of repair so as to make it again available for the purpose of public worship, have decided that "it would be to the interests of all parties if the church were removed from its present position to some locality where it might be of greater benefit." The neighbourhood of the Normal School, in the angle between Garscube Road and New City Road, has been indicated as a suitable site. It is also proposed to remove the Tron Church. The churches committee of the Town Council have recommended that if a satisfactory site can be found, and arrangements come to as to the erection of a suitable structure under which the interests of the parishioners of St. Enoch's can be conserved, the committee recommend that arrangements should be made under which St. Enoch's Church may be removed from its present site; that the committee should be instructed to consider the present position of the Tron Church, and, having regard to the requirements of the district in which it is at present situated, to report as to what arrangements should be made to effect the removal of that fabric; also that the committee be empowered to enter into negotiations with the Presbytery of Glasgow in connection with the various matters above alluded to.

THE Parisians have resolved on another imitation of an English aid to sanitation. A "destructor" is to be set up at Javel for dealing with kitchen refuse. The Leeds type has been adopted, for the experts who were sent over to study the question came to the conclusion that it produced the most satisfactory results. The French are the most economical of all people, and it is believed that sufficient fuel will be obtained from the chips that are left after the forming of wood-blocks for paving, a kind of work which is also in progress at Javel. The works have been just commenced, and the crematory is expected to be completed at the beginning of next year. If, after a year's trial, the anticipations are realised, several other destructors will be set up by the Municipal Council.

THE LONDON BUILDING ACT, 1894.—II.

WHENEVER an iron building or other structure to which the general provisions in the sixth part of the Act are inapplicable is to be erected, the builder is to make application to the Council, and send in plans and particulars of the construction. If satisfactory, approval shall be signified, but "the Council shall not authorise any building of the warehouse class to be erected of greater cubical extent than 250,000 cubic feet except in accordance with the foregoing provisions of the Act." The Council can also issue general rules respecting applications, plans, expenses connected with special and temporary buildings. All expenses incurred are to be paid by builder to the superintending architect or other officer, and in default payment may be recovered in a summary manner. A copy of plans and particulars as approved is to be furnished to the district surveyor, whose duty it will be to ascertain that the building is carried out accordingly.

When approving of plans of a temporary building the Council can limit the period during which it will be allowed to remain, and impose such conditions about removal as they think fit. If the conditions are not observed, occupier or owner can be summoned to a petty sessional court, and if the complaint is proved, an order will be issued authorising Council to remove or take down the building and convey the materials to a convenient place, and unless all expenses are paid within fourteen days sell the same.

Except hoardings enclosing vacant land and which are not to exceed 12 feet in height, no wooden structure is to be erected without a license from the Council. Movable or temporary structures erected by a builder for his use during the construction, alteration or repair of a building and which are immediately removed after the work is accomplished are not comprised under the section. Nor are hoardings duly licensed by local authority, or piles, stacks or stores of timber not being a structure affixed or fastened to the ground.

The eighth part relates to the

Rights of Building and Adjoining Owners,

and in it there is hardly any departure from the Act of 1855.

Where lands of different owners adjoin and are unbuilt on at the line of junction, and either owner is about to build a party wall, he may serve notice on the adjoining owner describing the intended wall. If the adjoining owner consent the wall is to be built half on the land of each or in such other position as may be agreed upon. The expense of the building is to be defrayed by the two owners in due proportion, regard being had to the use they make of the wall. If the adjoining owner will not consent, the wall is to be built not otherwise than as an external wall on the building owner's land. If the building owner desires to build an external wall on his own land instead of a party wall, he may serve notice to that effect on the adjoining owner. In either of the cases and after a month from the service of the notice, the building owner shall have the right to form the footings of the external wall with a concrete or other solid substructure on the land of the adjoining owner, but making compensation for any damage that may arise. When an external wall is built against another external wall or against a party wall, it shall be lawful for the district surveyor to allow the footing on one side to be omitted.

A building owner is to have the following rights in party structures, viz. (1) to make good, underpin or repair one which is defective or out of repair; (2) to pull down and rebuild one when necessary; (3) to pull down any timber or other partition which divides buildings and is not conformable with the Act, and to build instead a party wall; (4) in cases where rooms and storeys belonging to different owners are intermixed, to pull them down, or the parts which do not conform with the Act, and to rebuild the same; (5) where buildings are connected by arches or communications over public ways or passages belonging to other persons, to take down and rebuild the parts that are not in conformity with the Act; (6) to raise and underpin any party structure permitted by the Act or any external wall built against such party structure on condition of making good all damage to "the adjoining premises

or to the internal finishings and decorations thereof, and of carrying up to the requisite height all flues and chimney-stacks belonging to the adjoining owner on or against such party structure or external wall;" (7) to pull down any party structure which is of insufficient strength for any building that is intended to be built, and to rebuild the same of sufficient strength, making good all damage; (8) to cut into any party structure on the same condition; (9) to cut away any footing or any chimney-breasts, jambs, or flues, or other projections, from any party wall or external walls in order to erect an external wall against such party wall, or for any other purpose; (10) to cut away or take down such parts of any wall or building of an adjoining owner as may be necessary in consequence of their overhanging the ground of the building owner, in order to erect an upright wall against the same. In all these cases the condition of making good all damage is prescribed. (11) A right to perform any other necessary works incident to the connection of a party structure with the adjoining premises. But the above rights are subject to the qualification that any building erected before January 1, 1895, if conformable with the Acts regulating buildings in London then in force, is to be deemed conformable with the provisions of the new Act. (12) A right to raise a party fence wall, or to pull the same down and rebuild it as a party wall.

The adjoining owner retains his rights as defined in the preceding Acts. He may require the construction of such chimney-copings, jambs, breasts, flues or similar works which may be fairly required for the convenience of the adjoining owner. It will be the duty of the building owner to comply with the requisition in all cases where the works will not be injurious, inconvenient, or cause unnecessary delay to him. Any differences on the subject to be settled by surveyors representing the parties.

Without the consent of the adjoining owner and occupiers, or when a party structure has become dangerous, (1) a building owner is not to exercise any of his rights unless at least two months before doing so (it used to be three months) he has served notice on the adjoining owner stating the nature and particulars of the proposed work and the time at which it is to be commenced. (2) Where a building owner lays open any part of the adjoining land or building, he is bound to provide a proper hoarding, shoring, or temporary construction for its protection and the security of the adjoining occupier. (3) The rights are not to be exercised in such manner or at such time as to cause unnecessary inconvenience to the adjoining owner or occupier. A party wall notice is of no avail unless the work is begun within six months and is prosecuted with due diligence. Within a month after receipt of notice the adjoining owner may serve on a building owner a notice requiring him to build on the proposed party structure any of the works specified to which the adjoining owner is entitled. The notice is to be accompanied with plans and drawings if necessary. If either owner do not within fourteen days after service of notice express his consent, he shall be considered as having dissented, and a difference shall be deemed to have arisen between the two owners.

In cases of difference between building and adjoining owners, unless both can concur in the appointment of one surveyor to arrange the matter, each owner is to appoint a surveyor, and the two surveyors shall select a third, and "such one surveyor, or three surveyors, or any two of them, shall settle any matter from time to time during the continuance of any work to which the notice relates." Any award given shall be conclusive and shall not be questioned in any court, but either of the parties may appeal to the county court "within fourteen days of delivery of award, and the county court may rescind the award or modify it in such manner as it thinks just." If either party make default in appointing a surveyor the party giving the notice may make the appointment. The costs incurred in making or obtaining the award shall be paid by such party as the surveyor or surveyors determine. If an appellant from the award convinces the county court judge that in the event of the matter being decided against him he will be liable to pay 50% exclusive of costs, the appellant may bring an action in the High Court against the other party to the difference.

Where both parties have concurred in the appointment

of one surveyor, if he refuse or for seven days neglects to act, the matters in dispute shall be determined as if he had not been appointed. In any case where there are two surveyors who appoint a third, and the latter neglects to act, another third surveyor is to be appointed instead. If the two surveyors neglect to select a third, a Secretary of State can select some fit person to act as third surveyor. If one of the two surveyors should die or become incapable to act, the party he represented can appoint a successor to him, and failing to do so the "other surveyor shall be as effectual as if he had been a single surveyor in whose appointment both parties had concurred." After giving fourteen days notice a building owner and his workmen can enter on any premises for the purpose of executing work, and if the premises are closed they may break open any fences or doors if accompanied by a constable or officer of the peace in order to effect such entry. Where a building owner intends to erect a building within 10 feet of a building belonging to an adjoining owner, any part of which extends to a lower level than the foundations of the latter, he may, or if required shall, underpin or otherwise strengthen the foundations. Notice of the operations accompanied by a plan and section is to be given. If the adjoining owner objects, then a difference shall be deemed to have arisen. The building owner shall be liable to compensate the adjoining owner and occupier for any inconvenience caused, and he will continue to be liable for any other injuries which may arise.

An adjoining owner may require the building owner before commencing operations to give security for the payment of all expenses, costs and compensation in respect of the work. The building owner may also demand security.

The rules as to expenses to be borne jointly by the building owner and adjoining owner, and as to expenses to be borne by the building owner, correspond with those of 1855. It is added that if any fence wall be raised for a building, and if any fence wall be pulled down and built as a party wall, the building owner is to pay for the operations. But if an adjoining owner should at any time make more use of a party wall or external wall than before alteration was made, he is to bear a due proportion of the expenses. If the adjoining owner object to the amount claimed, the difference is to be determined in the way provided for in the Act, and until contribution is paid the party structure is to belong to the building owner. The adjoining owner is to be liable for all expenses incurred on his requisition. Nothing in the Act is to authorise any interference with an easement of light, or other easements in or relating to a party wall, or take away, abridge, or prejudicially affect any right of any person to preserve or restore any light or other thing in or connected with a party wall in case of the party wall being pulled down or rebuilt.

The ninth part of the Act is devoted to

Dangerous and Neglected Structures,

and it combines the enactments of the Acts of 1855 and 1878. The term "structure" comprises any building, wall or other structure and anything affixed to or projecting from them. When it is made known to the County Council (in cases where a structure is found in the City, the Commissioners of Sewers are to take the place of the Council) that any structure is in a dangerous state, a survey is to be made by the district surveyor or some other competent surveyor. If the certificate given by the surveyor is to the effect that the structure is in a dangerous state, the Council can cause the same to be shored up or otherwise secured and a hoard or fence put up for the protection of passengers. Notice is to be given to the owner or occupier requiring him forthwith to take down, secure or repair the structure as the case requires. If the owner or occupier should fail to comply with the order as speedily as the nature of the case permits, and if the order of a petty sessional court to the same effect is also neglected, "the Council may with all convenient speed cause all or so much of the structure as is in a dangerous condition to be taken down, repaired or otherwise secured in such manner as may be requisite." The owner can require that the subject shall be referred to arbitration and "the notice served by the Council shall be discharged, amended or confirmed in accordance with the decision of the two surveyors or the arbitrator as the case may be."

Notwithstanding the arbitration, a petty sessional court on complaint of the Council can make any order which it may think fit with respect to the taking down, repairing or otherwise securing the structure.

All expenses incurred by the Council are to be paid by the owner of the structure, but without prejudice to his right to recover the same from any person liable to the expenses of repairs. If the owner will not pay, the Council can sell the structure, paying any surplus over expenses to him on demand. If proceeds are insufficient to repay the expenses, no part of the land on which the structure stands or stood is to be built upon until after the balance is paid. The Council can also recover expenses or balance thereof and all costs from the owner in a summary manner. The inmates of a dangerous structure are to be removed therefrom by a constable or other peace officer, and if they have no other abode he may require that they be received into the workhouse for the place.

Where a structure is ruinous or so far dilapidated as thereby to have become unfit for use or occupation, or is prejudicial to the property or the inhabitants of the neighbourhood, the Council can order the owner to fence in ground or put property into a state of repair within a reasonable time, and if the order is disobeyed may take down the structure and remove the materials. Afterwards expenses can be recovered, and the ground is not to be used for building until they are paid.

The tenth part contains the regulations for

Dangerous and Noxious Businesses.

A building is not to be erected within 50 feet of a building used for any dangerous purpose. But if one had been erected at a less distance before August 9, 1844, it may be rebuilt if it is ever pulled down, burnt or destroyed by tempest. A dangerous business is not to be established or carried on in any building or vault or in the open air at a less distance than 40 feet from a public way or 50 feet from any other building or vacant ground which does not belong to the same owner. The manufacture of matches ignitable by friction or otherwise, or other substances liable to sudden explosion, inflammation or ignition, or turpentine, naphtha, varnish, tar, resin, Brunswick black, and any other manufacture in which the materials or substances employed are liable to sudden fire or explosion, are to be deemed dangerous businesses.

Similar regulations are to be enforced in respect of noxious businesses, such as blood or bone-boiling.

The eleventh part of the Act deals with

Dwelling-houses on Low-lying Land.

A building to be used wholly or partly as a dwelling-house is not to be erected or adapted, without the permission of the Council, on land of which the surface is below Trinity high-water mark, and does not admit of being drained by gravitation into an existing sewer of the Council. The Council can prescribe regulations prohibiting the erection or adaptation of dwelling-houses on such land or on defined areas of it, or can prescribe the level at which the under-side of the lowest floor is to be placed, or insist on other provisions for drainage, &c. Applications for licenses must be made by any person seeking to erect dwelling-houses, and the matter shall be referred by the Council to their chief engineer, in order to determine upon what conditions the erection or adaptation can be permitted. The regulations of the Council are to be published from time to time in London and local newspapers.

Sky-signs

are the subject of the twelfth part. From and after the commencement of the Act—that is, January 1, 1895—it shall be unlawful to erect any sky-sign as defined in the Act. Existing sky-signs cannot be retained or renewed without a license. A license granted under the Act of 1891, and renewed under the same Act, may be renewed for one further period of two years, but not longer. A license granted under the Act of 1893 may be renewed from the expiration of a period of two years from the date of issue of such license for a further period of two years, and on the expiration of that period for one other period of two years, making, with the original term of the license, six years in all, but not longer. A license becomes void if any addi-

tion is made to the sky-sign except for the purpose of making it secure under the direction of the surveyor, or if any change be made in the sky-sign, or if the sign or a part fall through accident, decay or other cause, or if any addition be made to the building which involves the disturbance of the sky-sign, or if the building become unoccupied or be demolished or destroyed. The Council can take proceedings for the removal of sky-signs, or order any of their officers, servants or workmen to take them down and remove them, and to execute any works which may be necessary for that purpose.

The Superintending Architect and District Surveyors

enjoy the privilege of having the thirteenth part to themselves. There is not much difference between the old and the new clauses relating to them. The extent of the surveyors' duties is thus defined:—"Subject to the provisions of this Act and to the exemptions in this Act mentioned, every building or structure and every work done to, in or upon any building or structure, and all matters relating to the width and direction of streets, the general line of buildings in streets, the provision of open spaces about buildings and the height of buildings, shall be subject to the supervision of the district surveyor appointed to the district in which the building or structure is situate." The Council still retain the power to alter the limits of a district, or to unite two or more and place such altered district under the supervision of any district surveyor. The consent of a Secretary of State continues to be necessary for the dismissal of a surveyor who held office when the Act of 1855 was passed, but all others may be dismissed or suspended by the Council. The examination of candidates is entrusted to the Institute of Architects, but the reservation of "such other manner (of examination) as the Council may direct" continues. The surveyor may appoint a deputy in case illness, infirmity or other unavoidable circumstance prevents his attendance to the duties of his office, or the Council may appoint any other district surveyor or person to assist in such a case. The surveyor is not to act in the case of works under his professional superintendence any more than formerly.

The notices to be given by the builder to the surveyor continue the practice which is now observed, and the position of the surveyor in respect to building works is unchanged. In cases when irregularities occur, the surveyor is to serve the builder with a notice requiring him within forty-eight hours to carry out the amendment needed, or to cut into, lay open or pull down so much work as prevents the surveyor from ascertaining whether anything has been omitted or done in a wrong manner. A notice of irregularity can also be given after the completion of the building. If notice in writing has been given to the district surveyor by the builder or owner of the date at which the building has ceased to be under the control of the builder, then at any time within fourteen days after its receipt a notice of irregularity may be served on the owner or occupier or other person who has caused the work, instead of or in addition to the builder (if any). Where no such notice has been served on district surveyor, a notice of irregularity can be served on owner or occupier within twenty-one days. When the owner does not allow the builder to comply with the requisition, of a notice of irregularity served on the builder, and the builder serves notice on the district surveyor to that effect, a notice of irregularity can be served within fourteen days on owner or occupier. The consequences of such a notice, so far as they relate to the builder, shall apply to the owner, occupier, or other person served, but nothing in the section is to prejudice any remedy of an owner, occupier, or other person against the builder. Summary proceedings can be taken for non-compliance with the notice, and the Council can employ workmen to bring the work into conformity with the provisions of the Act.

The fees to a district surveyor are to be paid by the builder, or in his default by owner or occupier. Fees for services in the laying-out or formation of streets, lines of building frontage and any like service, will be paid by Council, as well as fees for preparation or giving of evidence before Tribunal of Appeal. A month used to be allowed for the payment of fees after the roof of a building had been covered in; henceforth only fourteen days are to expire,

and the same period is given for payment of fees in any work placed under the supervision of a district surveyor or for any special service performed by him. If fees are refused they can be recovered in a summary manner. The Council can substitute the payment of a fixed salary instead of fees, the fees being carried to the credit of the county fund. The Council can also abolish or reduce the fees, and pay the surveyors wholly or partially by salaries. The Council may undertake on behalf of a district surveyor any proceedings which would otherwise be undertaken by him.

By-laws.

The Council have the power under the fourteenth part of the Act to make such by-laws as are not repugnant or contrary to the provisions of the Act on the following matters:—Regulation of plans of new streets; plans and levels of sites for buildings; forms of notice and other documents; foundations and sites of buildings; mode in which materials are to be made, excavated, filled up, prepared and completed; thickness, description and quality of substances used in walls; dimensions of wooden bressummers; dimensions of joists of floors; protection of iron-work; woodwork in external walls; substances of which plastering may be made; materials used in filling up excavations within a house or 3 feet therefrom; lamp signs or other structures overhanging the public way; means of escape from fire in buildings over 60 feet high; duties of district surveyors in relation to by-laws; deposit of plans with district surveyors; fees to district surveyors; the imposition for every offence committed against any by-laws made under the Act of a penalty not exceeding 5*l.* and a daily penalty not exceeding 2*l.* for every day during which such offence continues after conviction. The by-laws are to be without force or effect until approved by the Local Government Board, and means are to be taken for their publicity.

Legal Proceedings.

All offences, penalties, costs and expenses under the Act or by-laws are to be prosecuted and recovered under the Summary Jurisdiction Acts. County courts having jurisdiction may settle time and manner of doing any work, and any person shall have the same right of appeal from a decision as he would have in any other matter. At least one-half the penalties recovered shall be paid to the Council. Council may demolish buildings, sell materials and recover expenses, and the powers conferred may be exercised by the local authority in like manner.

The most important creation of the Act will be the Tribunal of Appeal. It is to consist of three members, one of whom is to be appointed by a Secretary of State, one by the Council of the Royal Institute of British Architects, and one by the Council of the Surveyors' Institution. No member or officer of the Council is eligible for membership. The appointment is for five years, but a member can be reappointed. The Lord Chancellor can remove a member for inability, misbehaviour or other sufficient cause. Whenever a vacancy occurs the nomination of a successor lies with the Secretary or Society that appointed the former member. The remuneration of members is to be by salary or fees, or partly one and the other, as a Secretary of State may fix from time to time. The Tribunal can appoint clerks, officers and servants, provide offices and obtain such professional advice and assistance as may be found necessary. The Council may defray the expenses of supporting any of their decisions or those of their superintending architect, engineer, or a district surveyor before the Tribunal. If ordered by the High Court or a Judge the Tribunal shall state a case for the opinion of the High Court on any question of law in any appeal submitted to them. The High Court can reverse, affirm, or amend the determination, or make such other order as the circumstances of the case require. The Tribunal will have power to hear counsel, solicitors or agents, as well as the parties interested in a case, to administer oaths, to hear and receive evidence, to require the production of any documents and books, and to confirm or reverse or vary any decision and make such order as they may think fit, and the costs of any of the parties to the appeal, including the Council, shall be in the discretion of the Tribunal. Subject to the approval of the Lord Chancellor, the Tribunal may from time to time make regulations as to the procedure to be followed

in cases of appeal to the Tribunal, including the time and notice of and the fees. Any order of the Tribunal may be enforced by the High Court as if it had been an order of that Court. All fees and sums of money paid to the Tribunal shall be paid over to the Council, and all expenses of the Tribunal and the Council in reference thereto shall be defrayed out of the county fund.

Miscellaneous.

The sixteenth part comprises a great many subjects, such as expenses, power to annex conditions in giving sanction, plans and documents, storing of wood and timber, preventing obstructions, &c. One of the clauses says that in the event of its being necessary to take down any portion of an old building of architectural or historical interest constructed otherwise than in accordance with the regulations of the Act, or in the event of the destruction of any part of such building, the part so taken down or destroyed may, with the consent of the Council, be restored in the same material and in the same design as it formerly was.

There is also a recapitulation of the offences against the Act, including anything done in or about a building contrary to the provisions by a workman, labourer, servant or other person employed.

There is, too, a statement about the buildings and structures which shall be exempt from the operations of the Act. Some causes of annoyance will be removed by the including among them of greenhouses which are not attached to other buildings, attached greenhouses so far as regards woodwork of sashes, doors and frames, metal and glass cases for holding plants fastened to the woodwork of the sill and lower sash of a window, openings made into walls or flues for ventilating valves which do not exceed 40 square inches in area and are not nearer than 12 inches to any timber or combustible material.

Finally, there is a statement of the Acts, enactments, by-laws, &c., which are repealed.

URICONIUM.

AFTER an interval of many years, Mr. Kenward, F.S.A., of Birmingham, has revisited the site of the Romano-British city of Uriconium, at Wroxeter, Salop. He says he was very sorry to find that little or nothing has been done during the past twenty or twenty-five years to uncover the buried walls, or even of the small uncovered portion to protect against the modern what had been left by the old barbarians. The place, indeed, remains practically unknown. An occasional inspection by a wandering antiquary or a frolic among its ruins by an excursionist party seems to represent public interest with regard to it. And yet Uriconium or Virioconum as in the earlier and more correct form (Vrecon = Wrekin) is a place of exceeding interest. Whether we consider it as founded in the second or third century, or as pillaged and burnt by the Picts in the fifth, or by the Saxons in the sixth century, it is a landmark in our history not surely to be neglected. On the bank of the Severn, on the line of Watling Street, separated by only one station (Bovium) from the seat of the twentieth legion, Deva Colonia, Uriconium held a very strong and important position in the Midland Province. It was no mean city. The walls have been traced in a circuit of at least three miles. It is known that the remains of numerous buildings lie within their area. Throughout the last century and in the earlier part of the present desultory researches were occasionally made around the old wall, which has stood above ground, a massive fragment, for 1,500 years. But it was only in 1859 that a serious and systematic exploration was begun, under the direction of the late Mr. Thomas Wright and with the concurrence of the Duke of Cleveland. The basilica was then discovered and a portion of the public baths. The extramural cemetery was traced. Human bones, pottery in various styles, coins and implements were unearthed in abundance. Mr. Wright's valuable book and the Shrewsbury Museum contain ample records of these excavations and of the results. But the exploring committee could not struggle long against the interests of the owner and the tenants of the land. Rome must of course yield to mutton and turnips, and the greater part of the small uncovered area had to be restored to its agricultural level. Since the period named the work of exploration has been almost wholly neglected, and the preservation of what has been excavated is of so imperfect a sort that it may be some day said, as Mr. Chancellor Lowe remarked when asked to contribute to the researches on the site of Troy, "Is there any such place? 'Etiam periere ruinae.'" Dr. Schliemann has given a sufficient answer to that question in the case of Troy.

It is hopeless to approach the Government for pecuniary aid. Lord Sherbrooke on the occasion referred to objected to the use of "poor taxpayers' money" for such a purpose, unless, indeed, there were found treasures under the earth which Great Britain could share in. Uriconium certainly has no treasures of the kind intended by the Chancellor, but it has others which other men know how to value. The nations of the Continent have a far higher appreciation of the past. Italy, for instance, has laid open Pompeii and the Palatine Hill at Rome with the greatest assiduity and goodwill, and who can deny that history has been elucidated and education promoted by the abundant results?

It is to private aid, however, that we must as usual look, and the example of Silchester (Calleva) is a shining one. Thanks to the cordial liberality of the Duke of Wellington and to the unwearied exertions of the Society of Antiquaries, we are gradually acquiring a full knowledge of the structure and conditions of that first-class Romano-British station. And it is not doubtful that our descendants will know much more of it than we do. But how will it be with Uriconium?

A ROMAN VILLA NEAR CARDIFF.

THERE have lately been discovered near Cardiff on the Ely racecourse the remains of a large Roman villa. The find was made by Mr. John Storrie, late curator of the Cardiff Museum, who has now been engaged for the past two months in conducting preliminary excavations on behalf of the Cardiff Naturalists' Society, they having taken in hand the work of exploration. The results so far obtained are most satisfactory, proof having been found of the existence of prehistoric dwellings, upon the foundations of which a large and important Roman villa was erected. It also appears highly probable that, this having fallen into decay, a smaller Roman villa was built upon its foundations. The remains of the walls at present discovered are of great thickness and solidity. Among other articles met with are flint arrow-heads, large quantities of tesserae, fragments of Samian ware and black pottery, a considerable quantity of coloured and figured wall-plaster, Roman coins of various dates, fibulae and broken glass. At present the work has only been commenced, but the committee are most anxious that the site shall be thoroughly worked. The cost of this will amount to several hundreds of pounds. Nearly 100*l.* has been raised by subscriptions, but it is feared that the whole amount required cannot be raised locally. The Vicar of Cardiff accordingly appeals for aid to those who take an interest in archæological research.

LUCCA CATHEDRAL.

A COMMITTEE has been formed at Lucca for the restoration of the cathedral of that city. It is alleged that the tower and west front are not only in a dilapidated condition, but are positively dangerous, and that the cornices of the aisles are rotten from the percolation of water. The necessary works for the repair and restoration of the building will be put in hand so soon as the requisite funds are obtained, and it is also proposed to remove the houses built against the walls. It appears that there are no caputular funds available for the restoration of the cathedral, and an appeal is made for subscriptions, not only from Italy but from the lovers of art in all countries.

The cathedral was founded in 1060, and was consecrated in 1070 by Anselmo Badagio, who, having filled the episcopal chair of Lucca, became supreme pontiff under the name of Alexander II. (1061-73). It was this pope who presented the consecrated banner to William of Normandy when about to invade England. Most of the original features of the cathedral have been obliterated by subsequent additions. The west front was erected by the architect and sculptor Giudetto in 1204. Mr. Ruskin, in the "Seven Lamps," remarks, "The rich inlaid work of the front of this church and St. Michele are altogether unique. Both represent hunting pieces—lions, wild boars, wolves, foxes and deer pursued by hounds and men, with lance and horn, constantly repeated." St. Michele has been entirely ruined by restoration, and it is probable that a similar visitation will overtake the cathedral.

A Dinner of unique character was given on Saturday night (29th ult.) to a company numbering upwards of 600 in the palatial new annexe of the Holborn Restaurant. The guests consisted of all the artificers and workmen employed in the construction of this adjunct, of which Mr. T. E. Colcutt is the architect, the proprietors considering the men should be the first to banquet within its principal salon, the "King's Hall."

TESSERÆ.**Trimming Joists.**

THE efficiency of single flooring is materially affected by the necessity which constantly occurs in practice of trimming round fireplaces and flues and across vacuities. Trimming is a mode of supporting the end of a joist by tenoning it into a piece of timber crossing it, and called a trimmer, instead of running it on or into the wall which supports the ends of the other joists generally. A trimmer requires for the most part to be carried or supported at one or both of its ends by some of the joists, which are called trimming joists, and are necessarily made stouter than if they had to bear no more than their own share of the stress. Commonly it is found enough to make the trimmers and trimming joists from half an inch to an inch thicker than common joists. In trimming tusk tenons should be used, and the long tongue or main body of the tenon should run not less than 2 inches through, and be draw-pinned and wedged, moreover, if it do not completely fill the mortise in the direction of the length of the latter. The principal objection, however, to single flooring is, that sound readily passes through, the attachment of the boards above and of the ceiling below being to the same joists throughout. Another objection is the necessity of making the joists so thin, not to injure the ceilings, that they with difficulty receive the flooring brads in their upper edges without splitting. A partial remedy for both these disadvantages is found in a mode sometimes adopted of making every third or fourth joist an inch or an inch and a half deeper than the intervening joists, and to these ceiling joists are notched and nailed, or nailed alone. This, by diminishing the number of points of contact between the upper and lower surface, for the ceiling joists must be carefully kept from touching the shallower joists of the floor, is less apt to convey sound from one storey to another, and allows conveniently thin joists to be used for the ceiling without affecting those of the floor. It clearly, however, involves the necessity of cogging the deeper joists down, so much more on the wall-plates on which their ends rest.

Soane as an Architect.

Notwithstanding Sir John Soane's undeniable attachment to his profession and his industrious application to it, the majority of the buildings that he executed are little better than so many experimental attempts at originality, with considerable merit in parts but more or less failures upon the whole. With all his apparent fertility of invention they exhibit sameness of ideas, and those by no means of the happiest kind, while, with a good deal of study in some respects, they betray great neglect of it in others. Never was architect more unequal in his taste, not only at different times but in the same building, for not a single building among all that he executed or designed is consistently finished up throughout. On the contrary, striking beauties and striking defects are so oddly mixed up in several of them, that it is hardly possible to say which predominate. Even in mere designs, where he was at liberty to exercise his fancy without restraint, there invariably occurs something most offensively mean or extravagantly uncouth and absurd. Proofs of this assertion are furnished by the folio of "Public and Private Buildings," published by him in 1828, and which was intended to be in some measure a record of his long professional career, although the plates are wretchedly executed; and nearly the same may be said of those in the "Description" of his own house and museum—a quarto volume of some bulk printed by him in 1832 for private distribution and presents. In both instances he was most niggardly towards himself, yet in the latter not altogether free at the same time from vanity. The same may be said with regard to his house itself, the exterior of which is by no means such a specimen of taste as an architect would be ambitious of bequeathing to posterity, though taken altogether the building and its contents form a monument sufficiently expressive of the character of the man—a strange jumble of insignificance and ostentation, of parsimony and extravagance, of ingenious contrivance in some parts and of the most miserable conceits in others. Such as it is, however, it was for years his favourite amusement, even from the time when he commenced it in 1812; and as he seems to have grudged no cost in making repeated alterations, it is singular, more especially considering the purpose to which he ultimately destined it, that he should not have rebuilt the front and that of the house on each side of it (also his own property), so as to have produced a uniform façade of tolerably imposing aspect, even had he not added those houses to his own residence and museum. As an architect he did not, with the exception of the Bank—and there only in bits—accomplish anything of sterling merit. He had great ingenuity and contrivance, and was often singularly happy in those picturesque and perspective effects which depend upon arrangement and plan and on the mode of admitting light in interiors, but he never fully wrought up his ideas and often left them quite crude sketchings. His attempts at Gothic were almost beneath contempt. On the other hand, he is entitled to no small praise as being, if not the inventor of a new order, the first to apply and

naturalise in this country the Tivoli Corinthian, employed by him at the Bank, the north-west corner of which structure so infinitely surpasses anything that he ever executed or designed, that his reputation would stand higher if that were all that he ever did.

The Carpenters' Company's Frescoes.

The Carpenters' Company possess four mural paintings in distemper, and divided from each other by representations of ornamental pilasters. They are accompanied by mutilated inscriptions in English indicating the subjects, which are all Scriptural:—(1) Noah receiving the command to build the Ark, and the Ark being built. The inscription is from Genesis v. 13. (2) Josiah commanding the Temple to be restored, from II. Kings xxii. 3-7. The inscription is, "Kinge Josyas comandyd y^e h^e prest y^e m^oney w^h was . . . hous of y^e lord should be delyvered to y^e Carpynters w^out any . . ." On one side the king is giving his commands, on the other the carpenters are receiving the money. (3) Christ assisting his father in the carpenter's yard, from St. Luke ii. 42. The inscription is "Christ at y^e age of XII. yer^s syttinge amonge the teachers in the temple; his father and his mother come to seke hym; he went wyth them to Nazareth and was obedyent unto them. Lueke, ii. chapter." (4) Mutilated, about half the painting being destroyed, Christ teaching in the Synagogue, from St. Matthew xiii. 54, 55. The inscription is, "Chryst teachynge in y^e synag . . . wysdom is thys, is not thys that carpynters . . ." The paintings were accidentally discovered in the year 1845 by a workman during some repairs to the hall. Under the distemper is a layer of lime spread on the plaster. No certain evidence of the date of the execution of these paintings is to be found; there is, however, proof that they were in existence as far back as 1596. Among the Cottonian MSS., Julius, c. III. f. 272, is a letter from Thomas Nash, the Latinist and dramatist, to Mr. William Cotton, containing a distinct reference to the third of the series. The letter is without date, but Mr. Payne Collier, who published it in his "Annals of the Stage," vol. i. p. 302, judges from its contents that it was written about 1596. The passage is as follows:—"And for the printers, there is such gaping amongst them for the copy of my L. of Essex voyage, and the ballet of the threscore and foure knights, that though my Lord Marquesse wrote a second parte of his feverburden or idlenesse, or Churchyard enlarg'd his Chips, saying they were the very same which Christ in Carpenters' Hall is paynted gathering up, as Joseph, his father, stands hewing a peice of timber, and Mary, his mother, sits spinning by, yet wold not they give for them the price of a proclamation out of date, or, which is the contemptiblest summe that may be (worse than a scute or a dandiprat) the price of all Harvey's works bound up together." There can be little doubt that the paintings were executed several years before the date of this letter, probably in 1561. Extensive repairs took place in the hall in that year, including the repair of the western wall where the paintings are. If the paintings had been there previously they would have been destroyed or interfered with by the work then going on, and the Company's books contains allusions to works then executed. For instance, the painting of the "Skrenes" is mentioned and a "Storie" over the "Skrenes." The year 1561 was evidently a memorable one in the annals of the Company, for the four well-known crowns or garlands bear date in that year. There appears to be little doubt as to the reason for the careful concealment of the paintings. They in all probability never saw the light from the days of Cromwell till the year 1845, and had they been discovered they would doubtless have been condemned as superstitious and destroyed.

Wren and his Fees.

The enemies of Wren on the commission for the erection of St. Paul's having procured a clause to be inserted in an Act of Parliament, suspending a moiety of his pittance (200*l.* a year) till the building was finished, he was kept out of his money long after it was due under the pretence that the building was not complete, whereas the cavillers themselves by their impediments alone hindered its completion. He was in consequence obliged to petition Queen Anne, and in his memorial he states that the arbitrary proceedings of some of the commissioners had alone obstructed his measures for the completion of the work. This was handed over to the commissioners themselves for their answer, who replied by mean and paltry excuses. Wren, however, was not to be borne down by a low cabal: he next addressed the Archbishop of Canterbury and the Bishop of London, and the document itself affords ample testimony of the treatment he had received. "The design of the Parliament (he states) in granting the coal duty for the said cathedral, being to have the building completed with all possible speed, they did, to encourage and oblige the surveyor's diligence in carrying on the work, suspend half his allowance till all should be done. Whereby, I humbly conceive it may justly from thence be implied, that they thought the building and everything belonging to it was wholly under my management

and direction, and that it was in my power to hasten or protract it. How far it has been so your lordships know; as also how far I have been limited and restrained. However, it has pleased God so to bless my sincere endeavours, as that I have brought the building to a conclusion so far as is in my power, and I think nothing can be said now to remain imperfect but the iron fence round the church and painting the cupola, the directing of which is taken out of my hands, and therefore I hope that I am neither answerable for them, nor that the said suspending clause can or ought to affect me any further on that account. As for painting the cupola, your lordships know it has been long under consideration; that I have no power left me concerning it, and that it is not resolved in what manner to do it or whether at all. And as for the iron fence, it is so remarkable and fresh in memory by whose influence and importunity it was wrested from me, and the doing it carried in a way that I may venture to say will ever be condemned. I have just this to observe further, that your lordships had no hand in it and consequently ought not to share in the blame that may attend it. This then being the case, and nothing left that I think can keep the same clause of suspension any longer in force against me, I most humbly pray your lordships to grant your warrant for paying me what is due to me on that article, which was 1,300*l.* last Michaelmas. And if for the future my advice and assistance be required in any thing about the said cathedral, I will be ready to give the same and to leave the consideration of it to your lordships." This representation not succeeding, he applied at once to Parliament, who rendered him that tardy justice, the long denial of which reflects so much disgrace on those who opposed his just claims. "Whereupon that honourable and august assembly," says Sir Christopher, "so considered his case and were so well satisfied with the justice and the reasonableness of it, as to declare the church to be finished so far as was required to be done and performed by him as surveyor-general. And it was accordingly enacted that the suspended salary should be paid him on or before December 25, 1711, which he has the truest sense of and has not, he hopes, been wanting in all due acknowledgments and returns for it. Neither is it possible that he or his posterity should ever forget so signal and distinguishing a favour, while he can remember the unjust and vile treatment he had from some in the late commission for St. Paul's, which was such as gave him reason enough to think that they intended him none of the suspended salary if it had been left in their power to defeat him of it." By the death of Anne, Wren lost the last of his royal patrons; in the new reign, the king's partiality for his German subjects and their connections deprived him of the sunshine of royal favour. His talents, his uprightness and his fame were all forgotten; the corruption of that period in the disposal of patronage is well known. At last, after a severe struggle, in the eighty-sixth year of his age and the forty-ninth of his office as surveyor-general, he was deprived of his patent in favour of one Benson, his German influence prevailing over one who would not condescend to truckle even to a court and whose life, as Walpole observes, having enriched the reign of several princes, disgraced the last of them.

Roman Temples.

As in Greece, so also in Rome, the noblest specimens of columnar architecture are in the temples of the divinity, but it does not appear that the Romans were in the habit of constructing them peripterally, as the Greeks so constantly did. There are indeed ruins which induce the belief that they at times built dipteral temples, but their common practice (as far as existing examples are authorities) was to make them pseudo-peripteral or apteral and prostylar; of an amphiprostyle even we have not an example. It certainly is the custom to restore the ruined temples, whose remains are a few columns only, as if they had been peripteral, but it is done not only without sufficient authority but against that which the more perfect structures present. The great projection, too, that the Romans gave their porticoes is evidence that they were dependent entirely on themselves for effect, for they are generally projected three columns and their interspaces before the cella, which, however, has no pronaos with columns in antis, nor does it appear from existing remains that the Romans were accustomed to use that arrangement. Circular or peristylar temples are not uncommon in Roman architecture, and there are temples to which it can hardly be supposed that columns were ever attached; these are for the most part polygonal. Neither do the Romans appear ever to have constructed hypæthral temples with columns internally, as the Greeks did. Indeed it is a question whether all their temples were not cleithral, for it is not generally admitted that the Pantheon, which is hypæthral by the open eye of the dome, was originally a temple, and where the structures remain tolerably perfect, the ceilings and roofs appear to have been formed by arching from flank to flank, and thereby quite enclosing them. The application of columns internally is most strikingly effective in the Pantheon, where they are

arranged in front of niches or deep recesses, composed with antæ to carry a crowning entablature round under an attic on which the cupola rests. No representation can convey even the most incompetent idea of the effect of this arrangement to those who cannot gather it from the plan. A section presents only one compartment correctly; all the rest must of necessity be foreshortened. It is far otherwise with the Temple of Peace and the hall of the Baths of Diocletian, in which columns stand before the piers to have the entablature broken over them. This, indeed, was the result, as is sometimes explained, of the combination of columns with arches, and it is most clearly exemplified in those works which most probably originated the practice, and which are next in pretence to the temples—these are the triumphal arches. The Romans had not adopted the simple graduated stylobate of Greek columnar architecture in their temples, but made the access to their porticoes in front with thin steps, and built vertical stereobates along the flanks for the walls of the cella, or as stylobates, if there were attached columns. In applying a columnar arrangement to the triumphal arch this lofty stylobate was taken also. The breadth of the opening prevented the columns from being placed equidistant; they were therefore coupled, the entablature was broken over them, and necessarily the stylobate was cut through, leaving mere attached pedestals to stilt the columns, so that the whole ordinance was deprived of everything that could render it as a composition beautiful; its simplicity and harmony were entirely gone, and instead of giving a graceful character to the structure it became a mere attached frontispiece that could only deform it. As if conscious that the Corinthian was too beautiful to maltreat in such a manner, the Roman architects produced the hybrid, which has since been called the Composite order, to use in these compositions; in them, indeed, it is chiefly found, and if it were not evidently a mere deterioration of the Corinthian it might with truth and propriety be called the Roman order.

Classification of Imposts.

The mode in which an arch is connected with or made to spring from a shaft or column affords Professor Willis another means of classifying buildings. As there is usually an impost intervening between the arch and the shaft this may be either corbelled, continuous, discontinuous, banded or shafted. A corbelled impost is an arrangement in which the arch mouldings are supported on a corbel or bracket projecting from a wall or pier, so that in fact there is no shaft; a continuous impost is where one of the mouldings of the arch is a continuation of the shaft itself, so that there is in strictness no impost at all; a discontinuous impost is where there is no actual impost, but the moulding of the arch is different from the shaft which supports it, and the two mutually die away into each other; a banded impost is where the moulding of the arch is the same form as the shafts, and the impost appears to go round their point of junction like a band; the shafted impost is more like the original Roman form, the shaft being of a different pattern from the arch moulding, and the impost appearing effectually to separate the two. Taking these as the varieties, Professor Willis has shown that the shafted and the continuous were used in the Roman and some of the Romanesque styles; that the banded was used very slightly in the German Pointed and in the German Romanesque, in the doorways in the Lombard style, and almost universally in Italian Pointed; that the discontinuous is unknown in Italy, and only practised north of the Alps; and that many varieties of these were comprised in the richest Pointed structures.

Horizontal Repetitions.

In the Italian style the injudiciousness of putting order above order is manifest, because of the impossibility of maintaining a rational arrangement with regard to diminution and intercolumniation. The practice is, moreover, objectionable, because of the repetition of the similar parallel lines of the entablatures, similarly projected too, which destroy the breadth a composition should possess; and because the upper and crowning cornice, if in proportion to its own ordinance, must be disproportioned to the whole elevation, which takes from that member a character of grandeur or meanness, as it may or may not be fitted to its whole height. This is made very evident by the opposed fronts of the United Service and Athenæum Club-houses in Pall Mall, the former of which is finished by the thin, shelf-like cornice of a second order, and the latter by a bold massive crowning cornice in the style of that of the Farnese Palace. In a similar manner, and for the same reason, the practice of raising lofty basements to support columnar ordinances is injudicious; and this detracts much from the merit of the front of Somerset House, by making the crowning cornice of less importance than it should be. In St. Paul's this fault is partially relieved by the somewhat exaggerated size of the cornice of the upper order, and by the insertion of cut blocks, in the manner of upright modillions, under it the whole depth of the frieze.

NOTES AND COMMENTS.

A MEETING of the East Sussex County Council was held in Lewes on Tuesday. The visiting committee of the Haywards Heath Lunatic Asylum presented a report pointing out that, though there is nominally accommodation for 877 patients, several of the wards are overcrowded, and the number of beds in such wards ought to be reduced. The average annual increase of patients from East Sussex and Brighton is about twenty, and at this rate of increase the surplus beds will be filled with patients from East Sussex and Brighton in about four and a half years, or, if the reduction in beds is carried out, in from two to two and a half. The committee therefore asked the Council to authorise them to have plans and estimates prepared for buildings for the accommodation of a further number of patients, providing for (1) a hospital for the treatment of acute cases; (2) additional accommodation for pauper patients; (3) special accommodation for idiots and imbeciles; (4) accommodation for private patients. The proposal gave rise to a long discussion. It was considered by some of the councillors that the present was not a favourable time to set about works which would cost 42,000*l.* Eventually it was decided that the proposal should be considered by eight members of the visiting committee and eight members from the rest of the Council.

THE connection between the smoke from house fires and fogs which Dr. RUSSELL had established by undisputed experiments in London has been traced with similar exactitude in Liverpool. An account of the investigations prepared by Mr. T. L. BAILEY, Ph.D., and Mr. C. A. KOHN was submitted to the Sanitary Congress on Friday last. They found that the truly abnormal constituents of the Liverpool atmosphere might be classed under the following heads:—(1) Gaseous impurities, such as sulphur dioxide, hydrochloric acid, ammonia, organic compounds, and in some cases considerable excess of carbon dioxide; (2) solid impurities, such as dust, mineral salts, &c., and organised matter; and (3) liquid impurities, consisting of sulphuric acid, hydro-carbons, and organic bases. Of special importance were the sulphur dioxide, the organic compounds, dust, and organised matter, consisting of moulds and germs. Of the two former, the origin was undoubtedly the combustion of fuel, mainly in dwelling-houses. In the wake of these polluting materials followed fog, for it was known certainly that solid particles formed collecting surfaces for the deposition of atmospheric moisture. The method employed for the purpose of collecting evidence consisted in the establishment of stations for investigation in various parts of Liverpool, analysis being made simultaneously at each station. From results obtained at the two stations—the one at University College and the other in Vauxhall Road, where the experiments had been carried out by Dr. G. SCHACK-SOMMER and Mr. S. STEIN—it was shown that in the more thickly-populated parts of Liverpool the sulphur oxides existed in quite three times the amount found at University College, and, furthermore, that during clear weather there was a comparative freedom from sulphur oxides as compared with what was found during foggy weather. In regard to Liverpool itself, however, as compared with Manchester and London, the results were fairly low, and the decrease of noxious material which took place in Manchester and London during the summer months was more marked in Liverpool. The work done up to the present time shows the necessity of further investigating a question of such importance, and with that object in view it is proposed to establish several stations in addition to the two at present existing. It may be granted, however, without further investigation, that smoke is effective in producing fogs. The question then remains where is the remedy to be found? The chemists apparently can only suggest the abandonment of bituminous coal and the substitution for it of either gas or anthracite. Neither remedy is of the kind which appeals at once to lovers of a cheerful fireside. Far more compatibility would be found in improved fire-places. Several exist which, if used, would do much towards diminishing the quantity of sulphur dioxide and other dangerous elements, but as long

as commonplace and antiquated grates are used because they are cheap, we must put up with dense fogs.

THAT the old Egyptians believed in the virtues of permanent colours is evident from the inscription set up on one of the works of the pyramid builders, NEH FERMAD, which announces that colour decoration for a temple should be as eternal as the gods. In spite of time and weather, war and tourists, the walls still reveal with what care the colours were produced and laid on. Some efforts have recently been made in Germany to discover the secret of so much endurance. In the first place, it was ascertained that, with few exceptions, the colours were derived from mineral substances. The colour that was accepted as most fitting in mural decoration was a brownish-red, originally was not unlike the so-called Pompeian red. It was made out of an oxide of iron tempered with earth. As under the microscope the stuff appears to be remarkably fine in grain and uniform it is concluded that much patient labour was devoted to the grinding and washing of the materials. Oxide of iron was also used for the yellows and mixed with alumina, lime, &c., to obtain a variety of shades. Powder bronze and gold leaf may also have been utilised. The blue was derived from melted glass with a salt of copper, which it is supposed was allowed to flow into cold water in order that from the brittleness obtained in that way it could be more easily pulverised afterwards. Gums were used to make the stuff adhere to the ground when laid on. Gypsum was used for white, and when mixed with red, and it may be some other colour, formed a sort of pink. Some enquirers suppose that the red was a vegetable substance. The conclusions correspond to some extent with those of JAHN, which were announced half a century ago. According to his analyses the blues appeared to be oxides of copper, with a small intermixture of iron; in none of them was cobalt. The reds were red oxide of iron mixed with lime. The yellows were taken to be vegetable colours, the greens were mixtures of the vegetable yellow and copper blue, and the blacks were made out of pitch, charcoal, or soot.

THE style adopted for the Hôtel de Ville, Paris, is not supposed to be out of keeping with stained-glass windows. In them, as on the walls, the French painters will be afforded many opportunities to display their art in its earliest developments. Two windows designed by M. BESNARD were set up a few days ago in the buvette of the Municipal Council. The subject of one is the old fruit market, which is held on the bank of the river not far from the Hôtel de Ville. The scene allows of the richest colours without any loss of modernity. The subject of the other is no less happy. It represents the evening of a fête, and a few boys are seen on the trees fastening coloured lanterns. For his cartoons M. BESNARD received 120*l.*, and a similar sum was paid for reproducing them on glass. The walls of the buvette will be painted by M. FORAIN, whose illustrations in black and white are familiar.

THE coming winter will be, according to the correspondent of the *Times*, one of great activity and interest in Athenian archæological circles. Professor DÖRPFELD hopes to resume shortly his excavations between Mars Hill and the Pnyx, where last spring he discovered the great aqueduct (of PISISTRATUS?) and what he believes to be the long-lost Enneakrounos. These discoveries have given a new impulse to the long-cherished plan of excavating the entire north slope of the Acropolis; and the Greek Government has declared the whole of that region, from the Theseion to the Monument of LYSICRATES, "archæological ground," thereby forcing the proprietors to sell at prices to be settled by a mixed commission of sworn experts. This region is the well-known old quarter of modern Athens, consisting of little one-storey houses of two to five rooms. The cost of expropriation will probably amount to several million drachmæ, but the American and German Schools and the Archæological Society of Athens can easily cover the expenses between them. When this space is laid bare the greater part of ancient Athens will no doubt be brought to light.

OLD LONDON.

GRADUALLY but surely the landmarks of Old London are being swept away. The latest instance of this is seen in the demolition of Doctors' Commons, including the Vicar-General's Office and the Faculty Office, where, up to 1874, marriage licenses were granted. Here, in seeming irony, formerly stood the Probate and Divorce Courts and the Court of Arches. The well-known low archway in St. Paul's Churchyard will be greatly missed by the busy thousands who pass it every day. The touts for licenses, "two coves in vite aprons," as Mr. Samuel

Weller said, have disappeared, and ere long a huge warehouse will cover the ground. Doctors' Commons takes its name from the fact that the doctors of civil law formerly used the old buildings for study and practice, and communed or dined together in the hall. Of course the disappearance of such historical and interesting old buildings cannot but be regretted. We cannot but hope that the buildings about to take their place will be worthy of the site and proximity to our great metropolitan cathedral.

Mr. L. S. Marks, B.Sc., a student of Mason College, Birmingham, and an Associate of the college, has been appointed to organise and take charge of the mechanical engineering laboratory at Harvard University, United States, and to lecture on the steam-engine, thermo-dynamics, and ventilation and heating of buildings.

WATTON PRIORY.

ON the second day of the excursion of the members of the East Riding Antiquarian Society the first halt was called at Kirkburn, where the church, which is a fine example of late Norman work, was described by Mr. Bilson, of Hessle. The font, with its rich sculptures, excited much interest and discussion. The party then returned to the carriages, and another short drive conveyed them to the interesting church of Bainton. This fabric is chiefly of the later Decorated style, and the windows have reticulated tracery. It contains the exceptionally fine monument of Edmund de Mauley, who died in 1314. Mr. Bilson again proved himself to be a lucid guide and thorough ecclesiologist. Some discussion arose, which was taken part in by Messrs. Stanbridge, Leach, Hope and Cox. The members were most kindly entertained to luncheon at Bainton School by the Rev. J. W. Stanbridge, B.D., rector of Bainton. After luncheon several new members were elected, making a total addition of thirty-five during their meeting.

The carriages were then resumed for the longer drive to Watton. Upon reaching Watton Priory (which is generally in error styled Abbey) about three o'clock the visitors found that one portion of the old buildings was still standing, and occupied as a residentiary dwelling of some size by Mr. Beckett. It is a picturesque block to the east of the old conventual church and cloisters, and was probably the prior's lodging and guest-house, with part of the infirmary attached. It is of various dates, from thirteenth century to repairs and additions of the present day, but its chief feature is one of exceptional beauty and grace, namely, a fine two-storeyed oriel of fifteenth-century date. Last year the Society unearthed the ground plan of the conventual church, which was 208 feet long by 51 feet wide, and found that it was divided from end to end by a partition wall, which separated the nuns from the canons, Watton Priory being one of the three houses of the English Gilbertine Order, which remained "double"—that is, for both sexes—down to the period of the dissolution. The president (the Rev. Dr. Cox) said a few introductory words about the order and Watton. He stated that the remarkable Gilbertine Order, the only religious rule founded by an Englishman, was started by St. Gilbert of Sempringham in 1148. Two years later—namely, in 1150—Watton Priory was founded by Eustace Fitzjohn on the site of an old and long-disused Anglo-Saxon religious house. The original Norman church and cloisters were burnt in 1167. Watton was the largest and most wealthy of the comparatively few Gilbertine houses, which were only 25 in number, including several cells. The Watton inmates were limited to 140 nuns or sisters, and to 70 canons and lay brothers. At the time of the dissolution Watton was valued at about 7,000*l.* a year of our money. He pointed out a variety of peculiarities in the statutes of the order, which illustrated what they had found and what they might expect to find in the buildings. He regretted that owing to harvest labour they had only been able to give one whole week to this year's diggings, and, though much of interest had been revealed, the difficulty with regard to the housing of the canons and their cloister had not yet been solved, though it had been reduced to narrow limits. It was hoped that a shorter investigation next year might clear up the puzzle, so far, at all events, as it was capable of being elucidated.
